

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

A COURSE OF LECTURES

ON

THE LAWS OF INHERITANCE IN RELATION TO DISEASE.

Delivered at the Royal College of Surgeons of England,
June, 1881.

By PROF. JONATHAN HUTCHINSON, F.R.C.S.,

Senior Surgeon to the London Hospital; President of the
Pathological Society of London, &c.

LECTURE III.

THE accidents occurring to the fetus in utero, result in peculiarities the transmission of which is an exceptional matter; but every peculiarity, other than those so produced, is distinctly heritable, whatever may be the nature of it. In the case of certain features single members of a family may be affected by them to the exclusion of other members of the same family, or there may be at some time a blazing up of the feature, whereby many persons may be influenced from a common ancestor. It holds, however, that the more commonly observed deformities are more frequently inherited than those of an unusual kind, and in instances of single family prevalence we are entitled to entertain the supposition that a chance union between relatives more or less distant, together with the influence of prepotency, can explain the phenomena described.

The theory of physiological units enunciated by Herbert Spencer, and amplified into the doctrine of pangensis, offers a solution of the remarkable latency of characters already referred to, by which a feature once prevalent may remain undeveloped through several generations, and by-and-by exhibit itself in an undoubted fashion. This also helps us to understand the infrequent inheritance of deficiencies, the units of reproduction of lost parts being naturally suppressed or lost. Agassiz and Darwin's ex-

planation of the effect produced on successive births by the influence conveyed to the mother during a single intercourse, makes no endeavour to throw light on the special causes of inherited diseases, but it contains, nevertheless, the suggestion that malformations occurring in after generations may very well be associated with other and congenital defects. In the existing stage of our knowledge on this point it must suffice to insist, however, that any feature is transmissible.

The question now arises whether peculiarities acquired after birth are transmissible to the descendants of the affected individual; but it is essential in this connection to distinguish between structural and functional changes. That functional endowments are heritable is amply shown; as, for instance, in pointers; and, on the other hand, we have as conclusive proof that changes of form produced subsequently to birth are not inherited, else how can we explain the continued reproduction of the lamb's tail and the Jew's prepuce? In relation to this the experiments of Brown-Sequard on the artificial production of epilepsy have been cited in opposition to the law of non-inheritance; but here we must decide that it is not the lesions that are transmitted but the nervous (functional) mobility which results in them. Neither has the author of these experiments himself attempted to add the weight of his authority to the oft-quoted but unreliable facts tending to demonstrate the reproduction of postnatal structural changes in descent.

The tendency to breed true becomes evident wherever malformations or diseases are once firmly established. Hence we meet with the frequent one-family prevalence of a particular affection, e.g., coloboma; epileptic guinea-pigs, deaf-mutes, and ichthyotic individuals, all afford illustrations of the tendency to breed true when once a feature is firmly established.

Dr. Adam's "unconditional transmission" has reference to spontaneous intra-uterine diseases, and not to those due to inherited tendency, and many examples can be adduced of peculiarities, such as hæmophilia and deaf-mutism, which attain their maximum at an early age of the individual. Tendency to tissue disorganisation rather than to defect of structure is set up, and subject to the law of

modification in the direction of the consequences produced. Step by step in our inquiries we steadily advance from a consideration of the physiological activity of the organs and tissues, on to that of heredity and the transmission of disease, the gradations being in a natural way from the simple to the complex.

Ichthyosis is a disease affecting the skin, which at one time attained much more serious and repulsive proportions than is likely ever to happen again, by reason of the primitive sanitary precautions adopted by those who inherited the complaint. Several examples of exaggerated *ichthyosis* are recorded, these persons having formerly "served as" objects of popular exhibition under the name of porcupine men. There are several well-authenticated accounts of inheritance of the disease; and four members of the well known Lambert's family inherited it, which, however, showed itself on the male side only. Notwithstanding, there cannot be said to be any law of limitation as to sex, relating to it; but the disturbance on the skin set up in *ichthyosis* is markedly associated with retinitis pigmentosa, and with deaf-mutism. The disease includes many varieties of skin affection, such as dryness, roughness, &c., occurring in infancy and persisting throughout the life of the individual. It varies somewhat in different cases from pityriasis to papillary overgrowth, and may be diffused over nearly the whole body; it is certainly all but invariably congenital. In mild cases it may make its appearance as late as the second year of life; but even in such instances there is a congenital appearance of the skin to indicate the inheritance of the tendency. Of *ichthyosis* it may be said (1) That it frequently occurs in several successive generations; (2) That it may be exaggerated in particular members of a family; and that (3) It may show a partiality for one sex rather than another. In one example of the disease transmitted to a third generation, the grandfather who was the subject of *ichthyosis*, had three sons and three daughters. The second daughter had two sons, the eldest daughter one son, all being affected with the disease, transmitted thus from the grandparent through one generation to the succeeding one. Many similar histories have been collected, and in most examples it has been found that exposed surfaces like the palms of the hands, tips of elbows, and soles of the feet are left free from the disease, but it may be developed on all the cutaneous surface: A girl, aged 13, one of five children, presented this appearance who as an infant had suffered extremely, and whose father had six brothers and sisters, he alone suffering, of them all, from skin disease (a form of psoriasis). His father and grandfather, however, had been similarly affected, and the example offered by this family history of *ichthyosis* being inherited from a progenitor whose only skin affection was psoriasis is a very good one, and affords an admirable illustration of the effects following from the activity of the law of prepotency in certain cases. The influence of sex limitation would seem to be suggested by the transmission from father to son, and mother to daughter, where this takes place; and the single family prevalence so frequently recognisable might indicate confinement of the power to a single parent. Always, however, the transmission of a strong tendency is followed by early development of the characters of the disease; and it is reasonable to assume that later manifestations of psoriasis afford indications that the affected individual inherits a tendency to disease, which, at an early period of life, might have become *ichthyosis*. Intervening forms undoubtedly connect the two diseases, in spite of their apparently distinct characters. *Ichthyosis* may be a diffuse dermatitis, occurring during intra-uterine life, its intensity depending on early commencement. Some years ago, a case was exhibited by Mr. Waren Tay, in which there was a congenital affection of the palms and soles of the patient, in character resembling psoriasis; and as an instance of the remarkable diminution of potency due to transmission, can be cited the history of a family suffering from scleroderma. In the first generation observed five members were afflicted, and two free from disease. In

the second generation, one, and in the third, three were subject to scleroderma. In the fourth generation, consisting of four families, only a single member out of each exhibited the symptoms of the affection.

Hæmophilia.—On this subject Dr. Wickham Legge has summed up in an exhaustive volume all the information we possess. It does not correspond to the hæmorrhagic diathesis, and must be confined to cases in which inherited transmission is provable, and in which there is a tendency to bleeding shown at early periods of life. In the opinion of the lecturer, however, it might be made to include some exceptional cases of late hæmorrhagic diathesis. The facts of inheritance collected in reference to hæmophilia are so convincing that to some observers it would appear that all individuals affected by it can trace, in some way, their source from a common origin; but this theory is negatived in great part by the fact that individuals so affected are distributed with about equal rareness and frequency in all parts of the world. One feature in connection with it is, indeed, very remarkable, and that is, the strong sex limitation evinced. As with colour blindness, it is usually found in severe forms in males only; and there is a great tendency with it to atavistic inheritance. Males, moreover, do not transmit it; and we find that when it is developed, the mother of the child in whom it is present comes from a family amongst which the affection has made its appearance. The reason for this is, possibly, traceable to the early age at which hæmophilic males succumb; and we may, perhaps, too, trace some connection between the disease and *gout*, by reason of the tendency to inflamed joints in the subjects of hæmophilia—a connection shown by many observers to really exist.

Colour Blindness.—This, which is much more frequently found in men than in women, and is very common among Jews, presents many puzzling features to account for. It is remarkably hereditary, and Dr. Wilson, who has given much time to its study, declares that for each case observed at least one other occurs, as is true also of *ichthyosis*. Colour-blindness, however, is not entirely confined to the male sex, although united testimony agrees in ascribing it much more commonly to males than to females. The classes most usually affected are the uneducated, Jews, and Quakers. At birth, possibly, there may be no more than a proneness to the condition in the infant, which, however, becomes intensified into actual defect at a very early age. It is certainly not associated with any structural omission, either in the eye or brain, nor can it be cured when it is definitely developed. There are facts tending to prove that an affected female may transmit the tendency to her offspring, and that succeeding generations are then influenced in direct descent; but such an occurrence is, nevertheless, very uncommon. That the male parent may transmit the disease to sons is generally observed, as also that daughters very commonly escape, the exemption being due in some degree to sexual prepotency, but also to the fact that the colour-sense in the female is both more definitely developed, and more rigorously cultivated than is the case with males. The comparative neglect of the colour-sense among Jews and Quakers, too, will serve to explain the frequency of colour-blindness in those two races during the period of education. In the case of Quakers, too, education has played an important part, and many whose colour-sense has been offended by the subdued colouring of quaker surroundings have, from time to time, removed themselves from the sect, thus intensifying the tendency in the remaining members. As well will this explanation apply to the absence of a musical sense which is associated with colour-blindness very often. Mr. Hutchinson suggested that intermarriage among Jews and Quakers has strengthened the hereditary tendency to this defect. Its non-occurrence among highly cultivated classes is an undoubted fact, and tends to illustrate the high perceptibility of the sense.

CLINICAL LECTURE

ON THE DIFFERENTIAL DIAGNOSIS BETWEEN CERTAIN HYSTERICAL CONDITIONS AND MYELITIS.

Delivered at the National Hospital for the Paralysed and Epileptic.

By THOMAS BUZZARD, M.D., F.R.C.P.

(Concluded from page 560, last vol.)

I LATELY saw, in consultation, in the course of a week, three ladies, each of whom had been thought to be suffering from hysterical paralysis, although, in two of the cases, there had been some difference of opinion on this point, on the part of those who had seen the patient.

The first case was that of a lady, *set.* 42, who had been confined five months, and for two months previous to the birth of her child, had complained of pain about one of her shoulder-blades, which had gone on increasing ever since. For the last six weeks she had gradually lost all power in her legs. More than one consultant had expressed the opinion that she was suffering from hysteria, and she had been treated accordingly, being made to get up daily, with help, and receive a cold douche bath. There was no doubt that she had shown symptoms of hysteria, apart from the pain and loss of power which had been ascribed to this cause. I found her lying in bed on her right side, unable to move her legs, which occasionally were spasmodically contracted. The legs presented no abnormal appearance, being neither flabby, nor at all wasted. Sensibility was not affected to any appreciable extent. When I dorsalflexed the left foot, there was strongly marked foot clonus, and the tendon reflex was generally very excessive. Coming now to examine the spinal column, I found a sudden angular curvature about the sixth dorsal vertebra, which was tender when touched. Pain was described as being dreadful in this neighbourhood, and extending along the ribs from this point. The bladder was powerless, and the urine ammoniacal. There was a commencing bed-sore on one buttock. The prone position was ordered, and opium administered. Four days afterwards she had rigors, and her temperature was 102°.

Ten days later I saw her again. She had improved somewhat (doubtless from the recumbent position) as regards the paralytic symptoms, and had acquired some command over the bladder, when she was seized again with rigors, fever, and delirium, and died a few days afterwards, apparently from pyæmia. The case was one of slow compression of the cord from disease of the vertebra, which was probably due to malignant growth. I can quite understand that earlier in the case there would be great difficulty in diagnosis, owing to the presence of strong hysterical symptoms, and the absence of any but the subjective symptom of organic disease, furnished by the patient's complaint of pain. But when I saw the patient, the signs presented left no doubt whatever. The ammoniacal urine and bed-sore (accompanying paraplegia) afforded positive evidence of organic disease affecting the spinal cord.

The second patient was a young lady, of about 25 years of age, who three months previously had been attacked with feverishness, aching in the legs, and pain in the back. The next morning she was weak on her legs, and complained of malaise. On the following day she was paralysed in both legs. There had been nothing wrong with the bladder, no loss of sensibility, and no cramps.

I found the patellar tendon reflex absent in each limb, and the muscles of both thighs thin and flabby. On percussing the vastus internus of either limb, there was no contraction. On the right side the tibialis anticus and peroneus longus muscles reacted to percussion, but not in the left leg.

Powerfully supported on either side, she could maintain the upright position, and walk after a fashion, there being some power of lifting the knees by the iliac-psoas muscle. The feet, however, were both dropped. The cutaneous reflex, from the soles, was good on each side.

Now it happened that this lady was under the care of a gentleman who is thoroughly well versed in neurological medicine, and in the scientific application of electrical currents. Anything, therefore, that I learned from him as to the electrical reactions could be depended upon. I heard that when he had last applied electrical tests (some

weeks, I think, before I saw the patient), reaction of degeneration had been typically marked in the muscles of the legs, which would only show the slightest possible action to the strongest induced current. The "reaction of degeneration," and the varying degrees of response to mechanical and electrical stimulation, showed conclusively that the case was not one of hysteria. There can be no doubt that the case is one of anterior polio-myelitis; there will probably be recovery to some, but not to a perfect extent.

The third case was one of an extremely interesting and important character for the opportunity of examining which I have to thank my friend, Dr. Playfair. The lady was 25 years of age, and I saw her last October.

Her history, as I learned it at the time, was briefly this:—There had been more or less uterine trouble (chronic endometritis) for four or five years. Three and a-half years ago, after the death of her husband, she had suffered from pelvic cellulitis, and the formation of an abscess, which discharged through the bladder and vagina.

Two years and a half ago she gradually lost the use of her legs; the paralysis being, in a few months, complete. It was preceded by cramps, and some loss of sensation. Nine months ago she began to get a similar loss of power in the left arm. The least attempt to raise her, I was informed, caused faintness and sickness, and bending the thigh upon the trunk occasioned great pain.

I found the patient in bed, lying on her back, and unable, according to her account, to move her legs at all. She was asked to try, but failed to produce any movement. The feet were dropped. The legs were very thin, presenting an appearance of general leanness, rather than of a specific muscular atrophy. There had never been any tendency to bed-sores. There was no spinal curvature or marked tenderness, but the patient said she had had pain referred to the lower half of the dorsal region of the spine. A catheter had been employed to empty the bladder for two years. The urine had always been acid. The use of the catheter had, it should be said, arisen in connection with the local bladder troubles from the abscess.

I found the patellar tendon reflex present, though not strongly marked, in each limb. The reflex from the soles of the feet was absent, and tickling was not felt. The legs were not contracted, but the joints were rather stiff. After wetting the limbs thoroughly with warm water, I applied strong induced currents to the muscles of the thighs and legs. She said that she did not feel them. There was a certain amount of contraction, but not a free response. There was evidently a good deal of resistance to the current in the skin, which was covered by a thick layer of epithelium, was rubbed up, and this in flakes, when the skin was sponged vigorously with warm water.

A strong constant current, slowly interrupted, was now applied to the muscles, and this she felt very much. A return was then made to faradism, and the currents were now felt acutely, and the muscles responded much more actively than they had done. Moreover, now, when very strong and painful currents were employed to the legs and feet, she used the muscles of her thighs freely, in what was evidently a quasi-voluntary effort to escape the pain of the application.

As regards the left arm, this lay motionless by her side, the forearm crossing her chest. The limb was neither rigid, nor peculiarly lax. It was like the limb of a person who neither aids nor resists movement. When I engaged her attention by examining her gums and throat, and, meantime, held up this limb, the arm did not drop, but subsided slowly and gradually to the bed when I let go of it.

A strong opinion was expressed that the condition was hysterical, chiefly on the following grounds. The gradual loss of power, with loss of sensation if it were organic, must have been due to more or less diffuse myelitis, involving grey as well as white matter. The situation of this must have been either in the lumbar portion of the cord, whence the nerves proceed to the lower extremities, or at some point above this. Had it been in the former, the patellar tendon reflex would have been absent, and the muscles would have lost their faradaic excitability. If it had been above there would necessarily have been by this time descending degenerative changes in the lateral columns, which would have shown themselves by more or less rigidity and exaggerated reflex. Had myelitis been so extensive as to involve the whole of the lower half of the cord in softening, there must have been bed sores and difficulties with the

rectum. The result of the case has justified the opinion which was arrived at by those who consulted upon it. Under careful feeding, moral treatment, and faradisation of the skin with the wire brush, the patient speedily regained the use of the arm, was shortly afterwards able to walk to a certain extent, and is now, as I learn, quite recovered.

In this case, as I have seen in many belonging to the class of hysteria, the epidermis, which had arrived at extraordinary thickness, apparently from disuse of the limbs, offered great resistance to the passage of electric currents. In these circumstances a more than usual amount of care in thorough soaking and rubbing of the skin, as well as in selecting the motor point, is necessary in order to avoid fallacies. (a) This woman's legs were very thin. There is, I think, a very common notion that the existence of wasting negatives hysteria. But a disused limb is of course liable to emaciate. The only way to distinguish with certainty between this wasting and that which arises from change in the trophic centre in the spinal cord, or from disease of a nerve-trunk, is by observing the condition of faradaic excitability, and seeking for any qualitative changes on interruption of the voltaic current. I have reason to think that not a few cases of anterior acute polio-myelitis occurring in young females pass as examples of hysterical-paraplegia, owing to omission to test carefully the state of the muscles by electric currents. Such cases may sometimes recover in the course of several months, and then the result is supposed to prove the truth of the diagnosis.

Absence of reflex from the sole of the foot is a very constant symptom in hysterical paraplegia. Where this co-exists with normal electrical contractility of the muscles of the lower extremities and normal tendon-reflex the case may be looked upon with suspicion, although this is not of itself sufficient to exclude organic disease. A persistency in the application of a stimulus to the sole will, in hysterical cases frequently, but not always, succeed in a few minutes in provoking a response.

Preservation of the roundness and firmness of a limb is often thought to be incompatible with paralysis. This is a dangerous error. In the case of Pott's disease, which I have referred to (the patient died a few weeks afterwards), the lower extremities were rounded, well nourished, and firm to the touch. In cases of localised myelitis of the dorsal region of the cord, followed by descending sclerosis of the lateral columns, there is frequently unusual firmness and tonicity of the lower extremities, which may appear indeed, to be models of muscular development. This is, important to remember, as hysterical imitations of lateral sclerosis are not uncommon. The most frequent, however, and at the same time the most difficult of distinction, is a condition closely resembling disseminated cerebro-spinal sclerosis. This must be reserved for future consideration.

BILIARY CALCULI IN INDIA.

By D. H. CULLIMORE, M.K.Q.C.P., F.R.C.S.,
Physician North-West London Hospital; Surgeon Indian Army
(Retired.)

THE late illness of the Governor-General of India, and the news recently received in this country of the death of Mr. Adam, the Governor of Madras, after a few months residence in that presidency, are facts, the significance of which are of considerable importance, not only to statesmen of mature age and ripe experience at home, but also to the people of India, and our other tropical dependencies. The welfare of the latter is so obviously

(a) As the motor point frequently varies as regards its position from that indicated in works on electro-therapeutics, I am in the habit of testing in the following manner: The limb having been very thoroughly wetted and rubbed with hot water, and the induction machine arranged to give a somewhat stronger current than is necessary in health, one rheophore is applied to an indifferent part of the body (as e.g., the sacral region), and the other is moved about the skin of the limb at the part where the motor point is expected to be found. It will soon be perceived, by comparison, at what point of application the most energetic contraction is excited. The skin is then marked at this spot with a wetted aniline pencil, and the operation is repeated on the opposite limb as well as the other muscles. The motor points having thus been ascertained, it is easy, by graduating the machine, to discover the weakest current which will cause contraction and compare it with that required in health.

bound up with, and depending on the choice of, the former, that whatever tends to form their decision, in accepting high appointments abroad, becomes a subject of surpassing, nay, of national importance. Hence an inquiry concerning the influence of climate in causing the disease, which in one instance terminated fatally, and in another was of a very alarming character, is at present not only not out of place, but very desirable. In any remarks I may offer I wish it to be clearly understood that they are made in the abstract, and deduced from the general history of the diseases in question, without any special reference to the individual cases just alluded to. And indeed, as regards the death of Mr. Adam, any such reference is impossible, for beyond the fact mentioned in the Indian lay newspapers, which are full of the subject, that he died from biliary calculi, and that his medical advisers, stated that it was a "melancholy satisfaction" to know that his death was in no way hastened by the effect of climate, I have no information. Yet even here it is possible from an investigation into the etiology, cause, and prognosis of cholelithiasis to do much towards placing on a settled basis the effect of climate in the production, and more as regards the termination of this disease. And this is the task to which the weight, I might almost say the entirety, of this paper is devoted; for the case of the Marquis de Ripon may be dismissed as one of fever from the combined influence of heat, over-fatigue and malaria acting, perhaps, more intensely and with greater facility on a constitution as yet unacclimatised, but to which all who in India allow devotion to duty to outrun their discretion are liable. The moral is that, like a general in action, very high officials should be cautious in exposing themselves to unnecessary personal danger.

Now, with reference to the influence of climate on the production of biliary calculi, the balance of practical experience will lead us, I think, to the conclusion that a tropical climate does not conduce or predispose to this disease, and that it rarely, if ever, acts as an exciting cause. As practical experience, however, is limited or uncertain, we are reduced to argumentative reasoning, and following this method it is difficult to escape the conviction that in hot climates Europeans are more subject to the development of cholelithiasis than in temperate ones, while as regards termination of this disease there can be no question that they are subjected to infinitely greater risks. Thus, it is not desirable that a person suffering from biliary calculi, say in this country, should go to India in hopes of cure or relief, and most certainly should he avoid such a course if his constitution is impaired, or if he be well up in years.

In looking into the literature of this subject, I find that as regards any connection between the occurrence of gall stones and climate, there is no allusion either in pages of Charcot, Frerichs, or Aitken. I am not sure whether Murchison refers to the subject or not, but my impression, if my memory be correct is, that he does not. Von Schuppell in *Ziemssen's Cyclopaedia* states, that the disease is of most frequent occurrence in Hanover, Hungary, Swabia, and England, while in Vienna one-tenth of all the bodies examined contain calculi. It is said to be rare in Finland and Holland, and on this latter account cannot be connected with malaria. As regards the frequency of calculi in hot climates, the general supposition appears to be, that it is rare in the tropics because, and because only, of the supposed prevention of its development by the abundant secretion of bile, a fact that cannot be gainsaid in case of new arrivals, but in favour of which there is very little reliable evidence either as regards the native or acclimatised European foreigner. Even here the opinions of competent observers are decided.

Thus while Annesley and Twining mention its occurrence in India, and Saint Vel believes that cholelithiasis is as common in very hot climates, as in temperate climates, and equally so in the black and the white races, we find on the other side that Hirsch in Germany considers it rare in the tropics, and Morehead in Bombay only saw four cases

in forty years. Such is the sum of direct experience as regards the influence of climate in the etiology of gall stones, and while it leans a little towards a not unfavourable view of the effect of hot climates, yet speaks with such an uncertain sound as obviously to be of little use in helping us to a solution of the subject in hand. To such an extent is this so, that it is necessary to try and effect it in a philosophical manner.

In the first instance, let us ask ourselves what are the conditions essential to the formation of gall stones? The first is some departure from the normal constitution of the bile, and the second is a retardation of the rapidity of its flow. Either of these, if excessive, will be effectual; but the former is the more to be dreaded, not only because it tends to produce the latter, but is also a condition whose removal is more difficult; and as regards hot climates, particularly in cases of beef-eating, beer-drinking, sedentary Europeans, must obviously be of more frequent occurrence than in temperate regions.

That the evils likely to accrue from an altered state of the bile may be prevented, or rather retarded, by the increased rapidity of its flow, is highly probable; but nevertheless, whenever the former condition predominates, the compensatory influence of the latter (supposing it to take place), like compensation elsewhere, can only be temporary. Hence, we might conclude without further proof, at all events, unless, as regards the young and the active, that cholelithiasis is more likely to be brought about in hot than temperate climates. But if we pause to investigate the causes, predisposing and active that tend to bring about the essential conditions I have this moment referred to, we cannot fail to be convinced that this disease, like most other hepatic affections, is called into being more frequently in the tropics than in Europe. Its course is also more beset with shoals and quicksands, and there can be little doubt that its safe arrival in port is attended with risks in the tropics that, in point of magnitude, are as the monsoons of the Eastern seas to the trade winds of temperate latitudes. The progress of biliary calculi in temperate climates is always favourable, and it would be no matter of surprise to know that it is not equally so India.

The causes that predispose to the formation of gall stones are:—1st. Old age, on account of the greater quantity of cholesterol in the blood. 2nd. Protracted ill-health, when the bile, becoming stagnant, assumes an acid reaction, and is therefore less efficient in keeping the cholesterol, &c., in solution. The acidity of the bile, which is always increased by a meat diet, and never occurs under an exclusively vegetable diet, is an active agent in the decomposition of the chlorate of soda, the principal solvent of the matters—cholesterin, cholepyrrhin, &c., which go to make up the structure of calculi. 3rd. Good social position from sedentary habits and luxurious dietary. 4th. Heredity. 5th. Atheromatous degeneration of the arteries. 6th. Diet. Meat diet in excess undoubtedly conduces to gall stones, but as to the influence of caloreficient food or alcohol, there is no reliable evidence. While on this point I may mention the injurious effect of a long continued interval between meals, which by resting the gall bladder, stops the flow of bile, and favours deposits. 7th. Sedentary habits which accounts for its greater frequency (three to two) in the female than the male sex. Under this head is included confinement to bed on account of illness, fractures, and surgical operations. 8th. Bad hygienic conditions, as shown from the fact mentioned by Glisson, that cows which suffered from biliary calculi in winter, when fed in houses, got rid of them in summer, when put out to pasture. 9th. Anatomical changes in the liver and gall ducts, together with tumours, inflammation, cancer, &c., which, encroaching on the lumen of the ducts, help to cause the retention of bile. 10th, and last, and more frequently than all others, catarrh of the bladder and biliary passages.

Of the causes here enumerated, some are, no doubt, in operation as frequently in temperate as in tropical climates, while others, on the contrary, particularly as regards Euro-

peans (and it should be borne in mind that their number in the East is fractional in comparison with the classes at home who suffer most from this affection), occur much oftener in the tropics, owing not only to the nature of the climate, but also to the difficulty or want of energy in taking regular exercise. Amongst this class women, and middle aged-men who lead a sedentary life, associated with epicurean proclivities, including an excessive meat diet (and good vegetables are difficult to obtain), stand prominently forward.

But a still more frequent cause, and one which is out of all comparison, more frequent in the tropics, is catarrh of the bladder and biliary passages, following, and due to, as Murchison tells us, in many cases to congestion of the liver, a disease so intimately connected with hot climates, either on account of the high temperature *per se*, or in combination with irritating injesta, as meat and beer has to stand without any explanation, almost in the relation of cause and effect. As catarrh of the bile ducts is not however, always depending on, or associated with, congestion of the liver, the frequency of the latter as a cause in this connection becomes important. Whenever, says Dr. Murchison, there is jaundice as well as light coloured-stools, there is catarrh of the ducts as well as congestion. Though in the earliest stage of congestion there may sometimes be an increase in the flow of bile of a dark acid character, very soon the secretion is stopped, and there is constipation, light coloured stools, and more or less jaundice, or at all events bilious discoloration of the skin and conjunctivæ. This is, I think, the rule, so that in cases when there is not constipation from the beginning, the onset of the latter, with the other symptoms due to retention of bile may be considered coincident in point of time with the inception of catarrh of the bladder and ducts. The causative effect of congestion being thus made clear, a careful examination into the mode of formation of calculi, will demonstrate to a certainty, the frequency of their catarrhal origin.

Now, lime which enters so largely into the composition of the nucleus of gall stones, is not a constituent of bile, but of mucus of the gall bladder, and the process of stone formation is somewhat as follows: 1st. There is swelling of the mucous membrane, and as inflamed organs are no longer efficient there results a paralysed state of the bladder and ducts, which causes not only a retardation of the flow of bile, but, as was explained before, by interfering with the functions of the bladder allows the retained bile to become acid, which acidity is promoted by an excessive secretion of mucus. In this way is established a state of affairs eminently calculated to facilitate the formation of stones by chemical change, viz, the decomposition of the solvent cholate of soda, which is at once followed by a deposit of the matters held in solution, a nucleus of aggreion being found in the mucus and lime already referred to. 2nd. Foreign bodies, shreds of detached mucus, &c., may act as centres, the process being completed in the manner just described. Thus, we see, how clearly congestive condition explain the formation of calculi, and as the connection of the former with tropical climates has already been demonstrated, there can no longer any doubt that not only do not tropical climates afford any protection from gall stones, but on the contrary the chances of their development are greater there than at home.

So much as regards the influence of hot climates in relation to the causation of biliary calculi. In conclusion, I shall now say a very few words as regards the same influence on the termination of this affection. A very few words will suffice, for at this period the risk is so much greater, that a plain statement will make it self evident to all.

This affection is, under all circumstances, and in all countries, of an eminently chronic character. It is slow, equally, in its dormant state, as during its more active and varied manifestations. The usual result is recovery, either by expulsion of the calculi, or their solution in the bladder. They sometimes crumble away, and break up into *débris* from a supposed destructive action of certain bacteria. They are most frequently expelled whole, even under the influence of so-called solvent remedies, as

turpentine, ether, &c., whose action is probably more antispasmodic than chemical. Recovery is generally perfect, all stones being expelled, and when relapses recur, we cannot be sure if all the original stones were got rid of. Now and again, however, we find ulceration, inflammatory obliteration of ducts, and other complications that lead to permanent jaundice and wasting, followed by death, after periods ranging from six months to two years.

"Death during the paroxysm" says the author, in Ziemssen's "Cyclopædia," is rare; "indeed, it more frequently causes a fatal issue from the stones giving rise to perforation or rupture of the bladder, or ducts, to diffuse cholecystitis, with hectic or pyæmic fever, to purulent hepatitis, to pylo-phlebitis, or, by impaction from ilius, or perforation of the intestine. The patient is subject to manifold dangers, and even after a period of quiescence the disease may recur. The prognosis should be guarded but hopeful, for many protracted and grave cases terminate in recovery under the influence of well-regulated therapeutic measures."

Such are some of the tendencies to a fatal issue that have to be guarded against in this disease, and that their nature is, in almost every instance, of a form calculated to be influenced more deleteriously in the tropics, than in Europe few will dispute. Purulent hepatitis, diffuse inflammation, pyæmia, &c., are all more necessarily fatal in hot countries, where death is often the result of an unequal struggle between the waning powers of an exhausted constitution and the encroachments more or less rapid of low forms of diffuse abdominal disease.

On this account, however, it is not contended that people in good health should not go to India. I advocate no proceeding so quixotic, but simply maintain that those well up in years, when showing a tendency to biliary calculi should remain at home. And there is a greater reason to follow this course if they are new to hot countries, for then it is impossible to foretell how the climate will influence them; but this much is certain, that in addition to the diseases of temperate climates, they will meet with others specially connected with the tropics. If this quotation from Dr. Hunter's book, "Health in India,"

"Better fifty years in Europe
Than a cycle of Bombay,"

be a correct estimate of the relative value of life for the young and vigorous, the nature of the risks to those predisposed to the disease under consideration, when no longer young, will be more easily estimated.

Clinical Records.

ST. BARTHOLOMEW'S HOSPITAL.

Four Cases of Carcinoma Uteri, occurring in the Out-patient Department.

Under the care of DR. GODSON.

Reported by MR. SIDNEY DAVIES, B.A., Clinical Clerk.

I.—SOPHIA N., æt. 37, had been married twenty-one years, and had borne eleven children. She had had no miscarriages. She had never been to the department before, having had no previous obstetric complaint. Her last child was born a year and nine months previously. She had been losing blood for eight weeks, and had bled profusely the day before she came to the hospital. Since her last confinement she had never ceased to lose blood for more than a week at a time. When not losing blood she had a fetid watery discharge.

The patient came complaining of pains in the lower part of her back, which she had suffered more or less continuously since her last confinement. She stated that latterly she had lost flesh. She had a cachectic appearance.

On making a vaginal examination, Dr. Godson found the cervix destroyed, leaving an opening leading to an ulcerated

cavity. She was ordered haustus ferri et ammon. cit. (S. B. H. Pharmacopœia) ter die; and to relieve the pain—

R. Chloral hydrat. gr. x.;
Liq. morphia, ℥x;
Aq. menth. pip., ʒj. Omni nocti sum.

II.—The second case was that of Mary H., æt. 62, who had been married thirty-six years, had borne two children, and had two miscarriages. The last child was born thirty years before, and the last miscarriage happened a year before that. She was employed as a monthly nurse. Her menopause occurred at the age of forty.

The history of her illness was as follows:—Two years ago she began to lose blood, and since then has never been more than a week free from blood-loss. About two months ago she lost a great deal—almost (she said) like a miscarriage.

The patient came complaining of dreadful pain in the lower part of her back, continuing during the last two months. There had been no loss of blood during that time, but in its place a discharge which she likened to "green waters," and inodorous. The pain was worse in bed, and she slept but little. She had lately lost much flesh. Her left leg had been swollen during the last two months. Bowels not constipated; urine scanty, scalding when passed.

Dr. Godson made a vaginal examination, and found the vaginal wall ulcerated, and the cervix destroyed, and replaced by granulations, which bled on contact.

On inquiry the patient stated she had always been healthy, and a sister had died at the age of seventy. There was no family history of carcinoma. Like the first case she had a cachectic appearance.

She was ordered—

R. Chloral hydrat., gr. x.;
Haust. pot. bromid. co., ʒj. Omni nocte.

III.—The third case was Elizabeth M., æt. 42. She had been married seventeen years, had borne five children, and had one miscarriage, five months ago (alleged). The last child was born five years ago.

Patient gave the following history:—Six or seven months ago, when a few weeks over her monthly period, she had a flooding which lasted three weeks; clots were expelled from the uterus, but there was no other evidence of a miscarriage. Since then she had lost blood in considerable quantities every fortnight until seven weeks ago, when she had an attack of "inflammation," which had confined her to bed till the day she presented herself at the hospital. There had been no blood-loss since then, but a fetid watery discharge. There had been no pain lately but she could not sleep for restlessness. Bowels sometimes constipated, sometimes relaxed.

Vaginal examination by Dr. Godson: Cervix was found to be destroyed; there was a large opening in the vaginal roof, with indurated edges, leading into the cavity of the womb.

Dr. Godson pointed out the following features in this case:—1. The first symptom was bleeding, no pain being suffered till some time after. 2. There was no hereditary disease. 3. The patient had never had ill-health, or any womb trouble.

She was ordered—

R. Ammon. carb., gr. iij.;
Haust. ferri et ammon. cit. ʒj. Ter die sum.
R. Chloral hydrat., gr. x.;
Pot. bicarb., gr. x.;
Aq. menth. pep., ʒj. O. n.; si opus sit;
and pil. col. c. hyosecy., gr. x. P. i. n.

IV.—Jane S., æt. 35, was the fourth case. She had been married sixteen years, borne seven children, and had one miscarriage four months ago (alleged). The last child was born fourteen months before. She had menstruated a fortnight before. The catamenial flow had been very profuse since the last confinement. She had nursed her child fourteen months.

The patient came complaining of bearing down of the womb, which interfered with walking. She had a constant desire to micturate. There was pain in the lower part of her back. During the previous fortnight she had had a profuse fetid discharge.

On vaginal examination, made by Dr. Godson, the cervix uteri was found to be destroyed, the vaginal wall infiltrated

and very hard, the affected part reaching almost to the meatus urinarius. In the roof of the vagina was a large opening leading into an ulcerated cavity.

Dr. Godson called attention to the facts of there being no family history of carcinoma, and that the first symptom was a great loss of blood, mistaken by the patient for a miscarriage. Pain had only been a leading symptom during the last four weeks.

Patient was ordered—

- B. Liq. morphie, ℥x;
Haust. ferri et ammon. cit., ℥j. Ter die sum.
B. Chloral. hydrat., gr. x;
Liq. morph., ℥x;
Aq. m. p., ℥j. Omni nocti sum.

Remarks.—These four cases, taken at random from the practice of the last few months, though presenting no unusual features, are interesting as illustrating several points on which Dr. Godson is fond of insisting. Thus, in none of them was any family history of carcinoma obtained. They all appeared to have previously enjoyed good health, none having presented themselves in the obstetric department before. The first symptom noticed in all the cases was loss of blood, which, in two cases, was of such a nature as to be mistaken for a miscarriage. In the two cases in which the pain was not severe cachexia was marked, illustrating Dr. Godson's theory that cachexia is anemia plus pain. Lastly, it may be remarked that in all the cases the disease was too far advanced when they presented themselves for any operative interference to be deemed advisable.

N.B.—Haustus ferri et ammon. citratis (S. B. H. Pharmacopœia) contains: Ferri et ammon. cit. gr. viij.; ammon. carb., gr. ij.; spir. chlorof., ℥x.; inf. quassia ad. ℥j.

Transactions of Societies.

OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, JUNE 1st, 1881.

DR. MATTHEWS DUNCAN, President, in the chair.

DR. GODSON presented a cast of the child's head, showing a depression after delivery by forceps, which he had shown at a previous meeting of the Society.

DR. GALABIN showed microscopic sections from two cases illustrating the history of cancer of the internal surface of the body of the uterus. They showed a transition from cylinder epithelioma to carcinoma. The tissue was removed by curette. In the first case, in which the uterus was movable, and but slightly enlarged, there was proliferation of glands with up-growth of processes from their walls filling up the lumen. In the second case in which the uterus was fixed and nodular, there was in addition infection of the stroma with epithelial masses. He had found this cancer of the body of the uterus relatively not uncommon in virgins, but he had hardly ever met with the ordinary cancer of the cervix, where there was proof of virginity.

DR. WILTSHIRE related a case in which, after thorough removal of the malignant growth, and the use of perchloride of iron, the patient, a lady 60 years of age, lived three years all but one month, when cancer of the body of the uterus was diagnosed. Removal was desirable when practicable.

DR. CLEVELAND hoped that the time would come when such an exact diagnosis of the disease in its early stage might be established as to warrant recourse to more radical measures than had been carried out by Dr. Wiltshire, namely the entire removal of the uterus.

DR. HEYWOOD SMITH added his testimony to Dr. Galabin's as to the relative frequency of cancer of the body of uterus in virgins, and cited a case of a lady, aged 50. He considered that such cases could be disposed of early enough, the uterus should be removed, leaving the cervix as a stump.

MR. DORAN urged the importance of the fact mentioned by Dr. Galabin that cancer of the cervix was almost peculiar to impregnated women, since it was among such that the numerous forms of erosion were so frequently found. The cure of such a form of erosion as preceded cancer might absolutely avert malignant disease.

THE PRESIDENT considered that total extirpation of the uterus was at present too dangerous an operation. He had known a case of cancer of the cervix in a virgin.

DR. WILTSHIRE showed the uterus, fetus, and placenta from a case of utero-vaginal rupture. The placenta, which was prævia, was found in the vagina, and the head, which was low down, was delivered by the obstetric house surgeon. The patient rapidly sank. The uterus was large and thick, containing many small fibroids.

MR. ALBAN DORAN showed, for Dr. Bantock, a large thick walled, single cyst of the great omentum, removed by operation. The symptoms had resembled those of ovarian cyst. Once the cyst had ruptured and filled again, and several times it had been tapped. At the operation there was great difficulty in separating the cyst from its connections. A fold of muscle separated the cyst from the pelvic organs, which were absolutely normal. The patient was doing well four days after operation.

DR. GODSON showed "Marshall's Patent Sectional Feeding Bottle," which had a movable front, enabling the fingers to be introduced to clean the interior.

DR. HICKINBOTHAM ON

A CASE OF PLACENTA PRÆVIA COMPLICATED BY A LARGE MYOMA.

The patient was a delicate primipara, of small stature, at full term. She had previously aborted. She had been in labour six hours, and had lost much blood. The os was dilated large enough to admit two fingers. The placenta presented completely; no edge could be felt, and through its centre, which seemed to be the thinnest part, a rounded mass was felt, and supposed to be the fetal head. The author decided to break through the centre of the placenta, with the view of turning. Having torn through it, he discovered that the round mass was a large tumour, upon which the placenta was attached. The delivery of the placenta was therefore completed, after which the hæmorrhage greatly abated. Version was performed, the after-coming head perforated, and extraction effected with the aid of the crochet. A terrible attack of septicæmia followed, and for a fortnight I almost despaired of the patient's life. The tumour sloughed, and became protruded through the os. On the tenth day a softened and fetid portion was extracted, and the remainder painted with pure carbolic acid. In three months the uterus was freely movable, and its cavity of normal length, but the patient had not again menstruated at the end of eleven months. If the placenta had not been prævia the author would have preferred Cæsarian section.

DR. BARNES said that no general rule could be laid down for labour complicated by fibroid tumours. Sometimes necrosis occurred when the tumour did not obstruct delivery, and the cases might do well. Sometimes the tumour might be pushed out of the way, and delivery effected by craniotomy or turning; or enucleation might be available. In extreme cases Cæsarian section might be necessary, and in such cases it should be considered whether Porro's method of removing uterus and ovaries would not be best.

DR. HICKINBOTHAM said that the size and wide base of the tumour precluded enucleation. He did not agree with Dr. Barnes as to the advisability of removing the uterus, considering that the results of the operation had been very unsatisfactory; but he thought it would be sufficient to remove the ovaries and Fallopian tubes in performing Cæsarian section.

DR. MANSRELL MOULLIN ON

A CASE OF MYXŒDEMA.

The patient was aged 38, mother of four children. At the commencement of her last pregnancy she had been troubled with swelling about the eyes, which continued for a month or two. Shortly after delivery the swelling about the eyes re-appeared, and from this period she dated her present symptoms which were those characteristic of myxœdema, as recently described, the urine being free from albumen.

DR. GERVIS had had three cases of myxœdema referred to him to examine the pelvic organs, but found nothing abnormal. Two had passed the climacteric, but one had not.

DR. WILTSHIRE suggested that the patient should be shown. The affection was, he believed degenerative, and often occurred about the approach of the climacteric.

THE PRESIDENT had two examples of the disease now under his care. One was a married lady under 40, who had borne children, but came to him on account of amenorrhœa. In the other patient, æt. 40, the periods were regular and copious, but the disease was described as beginning with exophthalmus and amenorrhœa for a year.

Dr. BARNES

NOTE ON THE SO-CALLED LITHOPÆDION, BEING A SUPPLEMENT TO THE AUTHOR'S PAPER ON SO-CALLED "MISSED LABOUR."

The author had examined the specimen in the Hunterian Museum from Dr. Chertton's historical case—undoubtedly one of extra-uterine foetation—and it had been minutely examined by Mr. Doran. The abdominal viscera and thoracic organs were quite soft, but impregnated with lime salts. The stem and subcutaneous tissue of the front of the thorax and abdomen were thick and infiltrated with lime salts, so as to feel gritty and friable. The same structures in the posterior part of the body were very thin, and converted into calcareous plates. Another specimen in the Hunterian Museum, without a history, but apparently a foetus of not more than seven months' development, had also been examined by Mr. Doran. It showed a more advanced calcification of the shrunken soft parts. The surface was brittle and not remarkably hard. The lungs were powdery, and effervesced with hydrochloric acid. In a specimen in St. Thomas's Museum the oyst-wall was calcified, and there were calcareous plates in the skin. The viscera and muscles were soft.

The PRESIDENT said that the paper impressed him with the necessity for greater care than he and other authors had used in applying the word lithopædion. The observations confirmed the remarks which he had made on the reading of Dr. Barnes's paper—that there was never a stone-child really, but only petrification of the membranes and adjacent foetal tissues.

The Mineral Waters of Europe.

THE "MEDICAL PRESS"

ANALYTICAL REPORTS ON THE PRINCIPAL BOTTLED WATERS.

By CHARLES C. R. TIGHBORNE, LL.D., F.O.S., F.I.C.,
President of the Pharmaceutical Society of Ireland, Lecturer
on Chemistry, Carmichael College of Medicine, &c.

WITH

NOTES ON THEIR THERAPEUTICAL USES.

By PROSSER JAMES, M.D., M.R.C.P. Lond.,
Lecturer on Materia Medica and Therapeutics at the London
Hospital, Physician to the Hospital for Diseases of the
Throat, &c.

(Continued from page 555.)

Tarunus.

THIS water is derived from a well-known spring, situated at a short distance from Frankfort-on-the-Maine. As it has been lately analysed by Taylor, we give his analysis, only converting the original figures into grains per gallon for the sake of comparison.

Chloride of sodium	180.04
Chloride of potassium	18.90
Carbonate of calcium	95.90
Carbonate of magnesium	12.32
Carbonate of sodium	1.40
Sulphate of calcium	4.06
Silica	traces
Alumina	traces
Phosphate of calcium	traces
Total solids	312.62
Carbonic acid (given as compressed)	202.58
Carbonic acid (in solution)	121.45

We have ourselves examined this water for nitrogenous organic matter, and find it fairly free therefrom. It will be seen that in it the alkalinity is greatly due to

the carbonates of the alkaline earths, and would be useful where bone constituents are wanting.

The skeleton analysis of 10 ounces ($\frac{1}{2}$ pint), gave

Total Solids.	Antacids.	Salines.	Purgatives.
19 $\frac{1}{2}$ grs.	6 $\frac{1}{2}$ grs.	12 $\frac{1}{2}$ grs.	None.

This water is peculiar, although pure; it is calcareous and non-purgative, and therefore should only be adopted under medical advice as a table-water.

Harzer Water.

We are at a loss to find out much information about the source of this water. It, however, seems to be making ground. It contains—

Bicarbonate of sodium	10.12
Carbonate of calcium	17.13
Carbonate of magnesium	3.62
Chloride of sodium	49.08
Chloride of potassium	0.28
Sulphate of sodium	1.13
Silica	0.12
Lithia (minute trace)	0.01
Total solids	81.49

Free carbonic acid, not determined.

Skeleton analysis of 103 fluid ounces, $\frac{1}{2}$ pint.

Total Solids.	Antacids.	Salines.	Purgatives.
5 1-10th grs.	2 grs.	3 1-10th grs.	.07 grs.

It will be observed that this water is one in which the sodium saline predominates with a well-marked alkalinity, due to bicarbonate of sodium, as evidenced by its action in phenol-ptalein. At the same time it is a comparatively light table water. It is quite pure as regards nitrogenous organic matter. The taste of this water is pleasant; in fact, we may say that it belongs to those waters which possess a special per cent. flavour. It is stated that this water has a large sale on the Continent, and that the consumption was 1,000,000 bottles in 1879, and has probably largely increased. The ingredients in this water are very nicely balanced. It is a strongly effervescing water.

Apollinaris.

Apollinaris water, according to the original analysis, is stated to contain 178 grains of solids per imperial gallon, 88 grains of which are carbonate of sodium. We find that this water is a little stronger than this, giving 258 grains, when thoroughly dried, at 212° F.

It contains—

Bicarbonate of sodium	106.21
Chloride of sodium	50.23
Sulphate of sodium	24.02
Phosphate of sodium	trace
Sulphate of potash	1.41
Carbonate of magnesium	45.00
Carbonate of calcium	28.80
Ferric oxide	1.00
Alumina	0.80
Lithium	minute trace
Silica	1.21
Free ammonia	trace
Nitric acid	trace

Total solids, dried at 212 ... 258.68

Free carbonic acid not determined.

Skeleton analysis of 10 fluid ounces, $\frac{1}{2}$ a pint.

Solids.	Acids.	Salties.	Purgatives.
16·1-10th grs.	11 $\frac{1}{2}$ grs.	3·1-10th grs.	1 $\frac{1}{2}$ grs.

The proprietors make a great point of contrasting this water with seltzer water, as it possesses similar constituents, but combined in happier proportions by the chemistry of nature. The italics are so in the circular.

The strong points about Apollinaris water are first, its freedom from organic impurities; secondly, its pleasant aerated character, and the fact that if the source of supply is so copious, it will probably be fairly constant in composition.

The original analysis runs (marked old analysis), when calculated to the imperial gallon,

Carbonate of soda	87·99
Chloride of sodium	32·62
Sulphate of soda	21·00
Phosphate of soda	
Salts of potash	
Carbonate of magnesium	30·94
Carbonate of lime	4·13
Oxide of iron and alumina	1·40
Silicic acid	0·56
Total			178·63 grs.
Free and semi-combined carbonic acid			27·75
Combined carbonic acid			8·7

We have some further remarks to make upon this water in our next.

THE proposition to fill one of the vacant nights of the approaching Congress by a fête at the Botanical Gardens has been favourably considered by the Reception Committee and by the Council of the Botanical Society, who referred the application to a Committee. It will be seen that the Corporation of London will, at a cost of £2,000, entertain the Congress at a *soirée* in the Guildhall.

AN examination of candidates for Commissions in the Medical Department of the Royal Navy will be held at the University of London, on Monday, 15th August, 1881, and the following days. Candidates must attend at 11 o'clock on 11th August, for preliminary examination as to their fitness for the service.

SIR JOHN LUBBOCK finds that ants are sensitive to the ultra-violet rays, and carefully carry away their larvæ from under its influence. *The Journal of Science* is of opinion that insects enjoy a different, and probably wider, range of vision than do vertebrate animals.

AN Examination of Candidates for Commissions in the Medical Department of her Majesty's Army, will be held at the London University, on the 15th August next, and following days, at 10 o'clock a.m.

DR. C. J. NIXON, Physician-in-Ordinary to the Lord Lieutenant of Ireland, received the degrees of LL.B. and LL.D. at the recent "commencements" of the University of Dublin.

ACCORDING to M. Tayon the production of wool in sheep is inversely as the secretion of milk.

ADVERTISEMENT SCALE.—Whole Page, £5 0s. 0d. Half Page, £2 10s. 0d.; Quarter Page, £1 5s. 0d.; One-eighth Page, 12s. 6d.

Small Announcements of Practices, Assistances, Vacancies, Books, &c., of Seven lines or under, 4s. per insertion; 6d. per line beyond.

Considerable reductions are made from the foregoing Scale when orders are given for a series of insertions. Letters in this department should be addressed to the Publishers.

The Medical Press and Circular.

"SALUS POPULI SUPREMA LEX.

WEDNESDAY, JULY 6, 1881.

THE PRESIDENCY OF THE ROYAL COLLEGE OF SURGEONS.

OUR contemporary, the *Lancet*, having made the discovery that bluster and swagger combined are very likely to defeat its object with regard to the Presidency of the Royal College of Surgeons now resorts to truckling, and seeks to cajole Mr. Wilson into the belief that it may possibly redound to his credit and increase his reputation if he will only consent to make way on this occasion for the wonderful councillor the *Lancet* wishes to set up. If our contemporary is just now so very oblivious of Mr. Erasmus Wilson's special qualifications for the Presidency of the College, our readers will, we are sure, excuse us making an attempt at enlightenment.

If Mr. Wilson had never been a successful practitioner in, and a great writer on, dermatology, his rank as teacher and an eminent writer on anatomy and surgical anatomy (the author of the "Vade Mecum" and joint editor of "Quain and Wilson's Anatomical Plates") would have fully entitled him to fill the office of President of the Royal College of Surgeons. Besides these qualifications he has written much and well on numerous physiological and other scientific subjects which, as we stated last week, have given him the position of a Fellow of the Royal Society and other learned Societies.

We would ask, Did not Mr. Wilson fill at one time the office of editor, or—as it is called in the absence of a responsible editor—sub-editor of the *Lancet*? What, then, at that time was the opinion of that consistent journal of Mr. Wilson's qualifications; then, when he was the intimate and valued friend of the late Mr. Wakley?

The consistency of the *Lancet*, however, cannot, in one respect, be denied, for it has earned and maintained the reputation of turning upon and abusing every friend and supporter it has ever had when it has obtained all that could be had from their services. Another characteristic of the *Lancet* will, no doubt, be illustrated on this occasion: It is generally recognised and remarked on that the praise of the *Lancet* is damaging, whilst its abuse is always the prelude of success. When the Fellows of the College re-elected Mr. Wilson as a member of the Council they virtually recognised his claim to the office of President in the Council, a claim which will be successful notwithstanding the unjust and ungenerous sneers of his *quondam* friends.

“THOUGHT-READING.”

THE performances of Mr. Bishop, who has introduced an American amusement into this country under the name of “Thought-reading,” are commented on in a recent number of the *New York Medical Record*, which, while admitting Mr. Bishop's claims to be entitled “a very clever young man,” yet fails to quite fully endorse the latter's supposition that he is the fortunate possessor of some occult power. Of course it may, by and bye, turn out that we have in our midst a gentleman endowed in some remarkable manner with a sense to which it is difficult to ascribe a distinguishing name; but, on the other hand, it is by no means less probable that the explanation of Mr. Bishop's skill in divining the direction in which individual secretiveness has been displayed by assuming him to have the faculty of appreciating infinitesimal variations of muscular form in the subject of his experiments will be found correct. On this theory, the term “thought-reading” is an entire misnomer, and the fitter description of the phenomena observed during the *séances*, would be that summed up in the term “muscle-reading.” It is worth while, however, to learn that the idea of this explanation, though of course it spontaneously originated in the minds of all those correspondents who contributed letters on the subject to the daily papers, and particularly to the *Standard*, immediately after Mr. Bishop's first appearance as a “Thought-reader,” is contained in several essays and works published prior to the sensational entertainments of which we have recently heard so much. Our American contemporary assists us in this matter, by recalling that so far back as 1877, there appeared in the *Popular Science Monthly*, a full account of the whole subject, by Dr. G. M. Beard, who not only thoroughly investigated the matter, but gave to it that rational explanation the recreation of which by so many independent authorities is not least among the marvels associated with the new study. The New York paper, naturally enough, remarks on the fact that we in England are but repeating what has already been accomplished on the other side of the

Atlantic: it was, perhaps, unnecessary to add that the act was an unconscious one.

Whatever the explanation of the phenomena characteristic of Mr. Bishop's performances may be; whether, that is, they are to be classed among the natural, physiological consequences of certain definite interactions between mind and body, or are to be forthwith relegated to the chaos of mysterious immaterialities, the number of which in existence at any one time may be taken as a fair indication of the educational standard of that time, one fact in connection with them is important and suggestive. We refer to the eagerness with which a certain section of “Society” has accepted and adopted the idea of Thought-reading; and we cannot help connecting with this the suggestion that its influence is an unhealthy one to bring to bear on minds already weakened by indulgence of tastes and fancies so discordant with vigorous development of the mental faculties as are the æsthetic nonsenses of the day. The miserable effeminacy of the beings representative of “culture” with whom we have unhappily been brought into contact has tended only to the development of utter disgust in our minds for the tawdry pretensions put forward by the sect. Originating mainly in the disordered fancies of a few ill-regulated minds, and acquiring importance only from the avidity with which distortions are at all times seized on and perpetuated by ill-regulated and unoccupied minds, æstheticism, at first the vision of a warped, ungenerous imagination, has grown with every fresh addition to the ranks of its disciples, and gathered into itself the stray abortions of genius that mark the progress of the age as much as the fruition of great works. That alone, indeed, which gives the craze such strength as it possesses is the fact that, of the numbers who are æsthetics, some few—but very few—have minds which, under a healthy *régime*, could have been productive of good and noble achievements; but which, warped and ruined by the ridiculous surroundings of the æsthetic creed, serve only to intensify by their incapable efforts the appearance of degeneracy the whole scheme exhibits. Of the rank and file of the æsthetic army, as of every hysterical school before, the majority are men of feeble intellectual development, and women of that ultra-sympathetic type which, when unoccupied by conventionality, is one of the forms of disease most prone to excite disgust and pity in the mind of the physician. That people such as these should find in “thought-reading” an occupation for themselves and an excitement for their friends is not a matter to call for any unusual surprise. There is much in the idea, and in the execution of it, to prove attractive to the emotionally-diseased. It will add a new topic to the only too limited stock of ideas already in the possession of the school, while the opportunities afforded by it for variations on the strictly limited vocabulary endorsed by æsthetic approval must be an additional reason to weigh in its favour.

We cannot resist a conviction that the state of English society at the present moment is such as to demand an earnest attempt in behalf of its regeneration. The hysterical element has been permitted to exert an influence on its development the effects of which we are experiencing in no inconsiderable degree; and the suppression of all

that aggravates a tendency to the continuance of pernicious excitement should be promptly determined on. In this direction something may be done by divesting of their mysterious surroundings every question the incomprehensibility of which serves to excite the susceptibilities of aesthetes or other hysterical individuals. The task is not, in every case, a simple one, it must be admitted; but in respect to the latest craze of "thought-reading," there should be very little trouble in forthwith reducing it to the level of scientific explanation, in accordance with the demonstrations of it afforded when the effort was first made to erect it into an independent mystery. Mr. Bishop himself is naturally impressed with the belief that his special powers depend on something much more inscrutable than a specially-acute muscular sense; but this assuredly affords no reason why physiologists should accept his supposition, and proceed to work from it rather than from the point of reason and knowledge. We cannot afford now to yield in the slightest degree to the pressure constantly being exerted by æsthetic and other opponents to scientific advance. Whatever may be the meeting ground of science and hysteria, let the battle be fought out forthwith on it; and further let the firmness which would be prominent in clinical treatment of individual cases be no less manifest in dealing with it in the mass. At any rate, we would make an imperative demand for the destruction of illusions, before dealing with the illusioned; the removal of the cause would do much to diminish the area over which it produces effect; and wherever science can do good by this means there is a field for scientific workers. At present æstheticism is among the most promising areas for both individual and collective effort.

DUBLIN SANITARY IMPROVEMENTS.

THE citizens of Dublin have watched with considerable interest and anxiety the inquiry which has just been held by the Local Government Board, into the manner in which the extensive public sewerage works some time past in operation have been carried out; and it is with a feeling of relief that they have learned that, with some trifling exceptions, their construction is satisfactory. Anything else would have been a grave calamity; for there is no greater sanitary evil than defective public sewerage; and the more so because the evil is to a great extent concealed from view, and is principally shown by its deadly yet stealthy effects. It is to be regretted that practical sanitary improvement in this city proceeds with so halting a pace, and notably in regard to the general pavement of the entire city. A loan has been obtained from Government for this most desirable object; but, if we judge by the progress during the present year, the present century will elapse before it is entirely accomplished. One of our greatest wants, however, is a proper system of at least weekly removal of house refuse from all dwellings, rich or poor, throughout the whole city by the sanitary authority. In every other large town in the United Kingdom such refuse is removed, often every day; and is never allowed to accumulate. In Dublin the Public Health Committee does little but discuss this matter; and as a consequence in all the best houses, with a few exceptions, there is a receptacle called

an "ashpit," full of refuse and garbage of the most offensive description, and frequently under the very windows of the dwelling. These ashpits are, in fact, open cesspools of solid sewage; and if permitted to exist in London would bring the death rate of that teeming hive of humanity in close approximation with that of our own metropolis. In well-ordered Dublin mansion, these ashpits are cleaned out once a-year; in most cases they are allowed to accumulate until they overflow into the adjacent premises. They ought not to be permitted to exist on any terms; and we would point out in this regard the example of Glasgow. In that city there has long been the usual system of constant house scavenging, with dépôts throughout the city; but the corporation have just abolished these dépôts, and now remove the refuse at once to a station outside, where it is manufactured into a valuable manure which finds a ready sale, and to a certain extent relieves the sanitary rates. The late Lord Palmerston defined dirt to be matter in a wrong place; and the definition holds true, if house refuse, which nearly altogether consists of the dust of coal ashes mixed with bones and other animal and vegetable *debris*. They contain most of the elements of good manure; and we trust that here, as in Glasgow, it will be converted from a public local nuisance into a general benefit. We respectfully commend this question to our sanitary friends.

Notes on Current Topics.

The Naval Medical Warrant.

THE recent regulations for medical officers of the Royal Navy purport to explain several points regarding which the latest warrant was acknowledged to be vague and unsatisfactory. It was felt that as a matter of fact nothing whatever, as a right, was conceded by that warrant, and, accordingly, the further explanatory clauses were awaited with a good deal of anxiety. It cannot be said that the qualifications required by candidates were of a high order. But are the inducements now offered of a nature to encourage zeal and desire for self-improvement in the service, or to ensure contentment on the part of men who adopt that career? For example, are chances of promotion to the higher ranks to remain as at present? There is nothing in paragraph 1 to guarantee that they are. Selection for promotion "for ability and merit" (paragraph 3) may be made a powerful weapon for evil to men passed over, if in some very rare instances it is justified in the case of individuals. With regard to promotions to the rank of Fleet Surgeon and Staff Surgeon (paragraph 4), there are so many conditions attached to the rules on the subject that experience alone will show how far "their lordships' discretion" and "their lordships' approval," repeatedly quoted therein, lean towards liberality or the reverse. With regard to retired pay, considering the restrictions in the way of promotion to the rank of Fleet Surgeon, it would seem fair that as in the army voluntary retirement on £1 per day, without such trammels, should be simply conceded in the Navy. Under the orders as now promulgated, no medical officer can calculate upon being a Fleet Surgeon at all. And so,

with regard to the clauses under paragraph 13, there are so many conditions attached in reference to voluntary retirement and withdrawal, as to virtually do away with any right on the part of officers conceded to claim a distinctly expressed privilege. And so on, more or less, with regard to the remaining paragraphs of the regulations now issued. But there is one point on which there is no uncertain sound given. It is expressed in paragraph 25, and runs thus:—"When an officer retires or withdraws on a *gratuity*, his widow and children will have no claim to pension or compassionate allowance"—a proviso surely cruel towards the unfortunate persons referred to. It is but right to accord credit to the Board of Admiralty for a desire to benefit the general service over which it presides. Considering, however, the tone and phraseology of the regulations now referred to, it remains to be seen how far young medical men may be prepared to accept the conditional terms therein held out to them.

Private Provident Dispensaries.

THE following narrative is instructive; we trust it will be a warning to all who are connected with institutions of the same character. We have spoken so frequently about the doubtful value of self-supporting dispensaries, conducted as private enterprise, that we need hardly again insist upon the desirability of abolishing all such speculations. Facts of the kind we now submit to our readers will do more than arguments in revealing the true nature and advantages (!) of these pseudo-charitable undertakings. We hope our readers will keep their eyes and ears open, and send us any extracts they may see in papers, or furnish us with similar facts which may have come to their knowledge, so that we may lay them before the profession. The *Medical Press and Circular* will take the place of the pillory. Names, once submitted to this moral punishment, and thus advertised gratuitously, will acquire a professional reputation, and a species of notoriety, which may prevent similar *laches* in the future. At the Manchester County Police Court, on Thursday last, William Hollingworth, the keeper of a peoples' dispensary at 134 Ashton New Road, Bradford-cum-Beswick, was fined £5 and costs for having issued a false certificate of death in contravention of the Registration of Births and Deaths Act, 1874.—Mr. H. T. Crofton prosecuted on behalf of Mr. Mark Ogden, superintendent registrar of the Prestwich Union. Mr. Beaumont, who appeared on behalf of the defendant, applied for leave to appeal against the decision of the Bench, but the matter was allowed to stand over for the present.—Thomas Giddings, consulting surgeon to the dispensary, then appeared in answer to a summons charging him with having committed perjury in a case similar to the above, which was heard last week and which was dismissed. He then stated that on the 25th April last he had attended a certain child at the surgery which died on the following day. He saw the child as he was passing through the room, and made some suggestions as to the medicine to be tendered to it, and gave other advice in regard to its treatment. Evidence was now given to the effect that the defendant had not prescribed for the child at all. The stipendiary said a *prima facie* case had been made out

against the defendant, who was committed for trial at the assizes, bail being allowed.

A Convalescent Home for Scarlet Fever.

It is a matter of surprise that hitherto neither public nor private benevolence has provided a refuge for convalescents from scarlet fever, yet great need prevails for such an institution, both on account of the large number of this universally shunned class themselves, and the general public amongst whom they become scattered, at the great risk of spreading the disease and spreading it broadcast. The leading members of the profession are unanimous as to the benevolent and sanitary nature of the measure of the founding an institution for the reception of persons recovering from scarlet fever, and a benevolent-minded lady, Miss Wardell, at length succeeded in bringing the Lord Mayor of London, and a number of the leading clergy, to move in the matter, the chief magistrate convening a meeting at the Mansion House to promote this laudable object. Last week a large meeting took place in furtherance of the object. The Lord Mayor was supported by the Earl of Aberdeen, Sir Rutherford Alcock, Sir J. Risdon Bennett, Dr. Andrew Clark, Mrs. and Miss Gladstone, Mr. Puleston, M.P., the Hon. A. F. Kinnsaird, and numerous influential members of the clerical and medical professions, when the following resolutions were unanimously passed:—

1. "That, in view of the great mortality from scarlet fever in the metropolis, and the spread of infection from patients in varying states of convalescence, especially amongst the working classes, where isolation from the healthy is impossible, the establishment of convalescent homes for such cases is of the greatest importance, as a means of checking the spread of infection, and as an aid to the more rapid recovery of the patients themselves; and this meeting pledges itself to promote the establishment of such homes."

2. "That, in order to carry out the objects contemplated in the first resolution, the following persons be nominated members of the 'The Scarlet Fever Convalescent Home' Committee, with power to add to their number:—The Lord Mayor, M.P., A. N. Agnew, Esq., Sir Rutherford Alcock, K.O.B., the Rev. R. C. Billing, M.A., Major-General J. T. Boileau, R.E., F.R.S., W. A. Broadbent, Esq., M.D., Andrew Clark, Esq., M.D., the Rev. S. F. Cumberlege, M.A., the Rev. J. Oswald Dykes, D.D., J. Hill Gibson, Esq., M.D., the Hon. and Rev. E. Carr Glyn, M.A., Hugh E. Hoare, Esq., Hugh H. Seymour, Esq., A. P. Stewart, Esq., M.D., Miss Mary Wardell, Hon. Sec."

3. "That a Medical Council be appointed to advise on all medical and sanitary matters, and that the following gentlemen be nominated: Dr. Andrew Clark, Dr. Broadbent, Sir Joseph Fayrer, Dr. Hill Gibson, Dr. A. P. Stewart, Dr. Wm. Squire, and that the members of the Medical Council be *ex-officio* members of committee."

A considerable sum towards the proposed Institution was announced, and the meeting terminated with a vote of thanks to the Lord Mayor.

Neglect of Death Registration in the South Dublin Fever Hospital.

In his latest Report the Irish Registrar-General complains that "as no returns have been received from the South Dublin Union Fever Hospital at Kilmainham for either of the last two weeks, and as the cases of typhus

reated in that institution have been for some time past numerous, no correct estimate can be formed of the total number of typhus patients at present in the Dublin hospitals. The incompleteness of the hospital statistics is to be regretted, but as all efforts to obtain the Kilmaham returns were unsuccessful, it is unavoidable."

Considering that the officers of this hospital are under control, primarily of the board of guardians, and secondarily, of the Local Government Board, we are rather surprised that neglect of duty so gross as to elicit this protest from the Registrar-General should be permitted. It is to be hoped that the remonstrance has ere this had its effect.

The Coming Meeting of the Social Science Congress.

which is to be held next August in Dublin is being organised under the auspices of one influential committee. The standing committee has suggested that in the Health Department the following special questions be discussed :

1. Is it desirable that hospitals should be placed under state supervision ?
2. Is it desirable that hospitals should be established for paying patients ? and if so, on what conditions ?
3. What is the best mode of enforcing the isolation of cases of infectious disease ?
4. How far has the prevalence of disease been affected ?
5. What, if any, additional legislation is necessary for the preservation of the health by those engaged in industrial occupations ?
6. Is any further legislation desirable in order to more effectually prevent the over-crowding of houses, which originally constructed as residences for one family, but which have been subsequently occupied by several families ?

The Royal Medical Benevolent College.

In our notice of the Report of the Council of the Royal Medical Benevolent College there was one circumstance which we omitted to comment upon, and that was the munificent gift of a member of Council, Mr. F. France, F.R.C.S., of a perpetual presentation to the Royal Asylum of St. Anne's Society, in favour of the orphan daughters of medical men who have practised in England or Wales. Mr. France has by deed vested the nomination in the Council of the College for the time being, requiring of them that "on comparing the claims of the respective candidates, that one is to be chosen by the electors which shall appear, in their deliberate judgment, the most deserving and necessitous ; but the selection shall not be by competitive examination, the object being, not to reward juvenile cleverness, but to assist the meritorious in time of widowhood and distress in obtaining a sound religious education for their children." As soon as the purchase of the presentation was completed, the Council nominated the sister of one of the successful candidates at the last election—Chloe E. Harris, the daughter of the late Dr. George S. D. Harris, of Leighton Buzzard, who died suddenly at his post of duty, leaving a widow and a large family totally unprovided for. We hope so good an example set by Mr. France may lead to the foundation of other similar scholarships.

The Council also had the pleasure of receiving last year a legacy bequeathed by the late Dr. W. C. Hood, for the purpose of providing exhibitions or prizes for the benefit of the pupils. It has been determined to utilise this bequest for the establishment of two exhibitions of the annual value of £15 each, to be tenable for two years, by boys who, having been pupils of the College for at least two years previously, and having matriculated at the London University, shall continue at the College with a view to pass their Preliminary Scientific, M.B., or First Bachelor of Science examination, before they leave. These exhibitions will in future be known as the "Ann Hood Exhibitions." The first was awarded last autumn to F. O. R. Stedman.

There will be, at Christmas, a few vacancies for exhibitioners of the class established in 1865. They must be "sons of some of the less fortunate members of the medical profession," and they pay only £30 a year for board and education, instead of the usual charge of £48 or £51, according to age, and are also excused the entrance fee and the subscription to the Exhibition and Scholarship Fund required from all other pupils. Applications for the admission of boys as candidates must be sent in by the middle of November, and the exhibitioners will be selected from the approved candidates according to the result of a competitive examination, to be held on some appointed day in December. All particulars can be obtained from the Secretary, at the office.

The Metropolitan Hospital Sunday Fund.

ALTHOUGH it is far too soon to attempt a forecast of this year's collections on Hospital Sunday, the amount already received, during the first fortnight, and up to the time of our going to press, exceeds former years by some two or three thousands. The sum total already exceeds £27,000, and as there are many collections, and probably some few private donations, yet to come, we trust it will not only prove to be the largest collection, but that it may go far towards meeting the estimated deficiency of £50,000 required by the hospitals and dispensaries to enable these institutions to utilise at least a portion of the beds which cannot be used for want of funds.

Foreign Visitors to the International Medical Congress.

AMONG others the following important delegates have been formally appointed. By the German Empress, Prof. Kuster ; by the King of Spain, Dr. Don Nicasio de Landa and Dr. Ferradas ; by the King of the Netherlands, Dr. Snellen and Dr. Guys ; by the War Department of the Prussian Government, Generalarzt Dr. Coler, Generalarzt Dr. Roth, and Oberstabsarzt Dr. Starke ; by the War Department of the United States Government, Dr. Billings ; by the War Department of the Government of Norway, Dr. C. Smith ; by the Austrian Government, Dr. R. Schnitzler ; by the Bavarian Government, Prof. Ranke ; by the Belgium Government, Dr. Pigeolet ; by the Swiss Confederation, Dr. Joël ; and from Rome, Signor Baccelli, the Minister of Public Instruction, will attend. Prof. Virchow has intimated his intention of being present. The duty of unveiling the Harvey

Memorial at Folkestone, on Saturday, August the 5th, has been entrusted to Prof. Owen.

Impertinent Questions.

IN the House of Commons on June 28th, Mr Corbet asked the Attorney-General for Ireland if his attention had been called to an inquest on the body of Mr. Thomas Cooke, who died of apoplexy at Baltinglass, County Wicklow, on the 9th inst., as reported in the *Leinster Leader* on Saturday last, from which it appears that for several hours after the apoplectic seizure, Mr. Cooke was not attended by a duly qualified medical man; that Dr. M'Dowell, the dispensary doctor at Baltinglass, who attended the case, when asked by a highly respectable juror if he was at home when sent for, replied that "he would not answer impertinent questions;" that the coroner (Mr. Philip Newton), when asked by another juror had he received a medical certificate as to the cause of death, replied "That was an impertinent question;" that during the progress of the inquest, which appeared to have lasted from 12 o'clock noon till four o'clock next morning, the coroner refused for several hours to send for the doctor, though pressed by the jury to call him as a witness; that he refused to receive the following verdict; "That the deceased died on the morning of the 9th inst. from an attack of apoplexy, and that we consider the reply of Dr. M'Dowell in refusing to say whether he was at home or not when he was called on to attend deceased, most unsatisfactory;" whether it further appears from the report that the coroner caused the jury to be locked up in the court house until they brought in a verdict drawn up by him at 4.45 a.m.; whether the Dr. M'Dowell in question has charge of the dispensaries at Baltinglass, Ballytore, and Stratford-on-Slaney, as well as of the poor-house at Baltinglass; and whether the proceedings at the inquest were legal, and if they were not, whether he will take steps to prevent a recurrence of similar proceedings on the part of public officials? The Attorney-General for Ireland in replying, said that his attention had been drawn to the subject, and he found on inquiry that the facts were substantially as stated in the question, except that the inquest did not last until four o'clock in the morning, but until half-past one. In looking through the accounts of the incidents that occurred, he did not find that there was any illegality in the proceedings. He found that Dr. M'Dowell filled the offices mentioned.

State Honours to the Profession.

WE are pleased to chronicle the fact that Her Majesty the Queen, recognising the eminent or heroic services of the following members of the Army Medical Department has been pleased to confer upon them the dignity of Companions of the Order of the Indian Empire, viz.:—Surgeon Major Oliver Barnett, Army Medical Department; Surgeon John Anderson, Army Medical Department, Surgeon to the Governor General of India; Surgeon Major E. J. Waring, late Madras Medical Service; Surgeon C. W. Owen, Bengal Medical Service; Surgeon Major C. Morehead, late Bombay Medical Service; and Deputy Surgeon-General Norman Chevers, M.D., formerly Principal Medical College, Calcutta,

The Victoria Cross.

THE Queen has signified her intention to confer the Victoria Cross upon Surgeon John Frederick M'Crea, 1st Regiment Cape Mounted Yeomanry, for conspicuous bravery in South Africa. The heroism for which Mr. M'Crea was recommended, is thus described:—"For his conspicuous bravery during the severely contested engagement with the Basutos, on the 14th January, 1881, at Tweefontein, near Thaba Teen, when, after the enemy had charged the burghers in the most determined manner, forcing them to retire with a loss of 16 killed and 21 wounded, Surgeon M'Crea went out for some distance, under a heavy fire, and, with the assistance of Captain Buxton, of the Mareteug Contingent, conveyed a wounded burgher named Aircamp to the shelter of a large ant-heap, and having placed him in a position of safety returned to the ambulance for a stretcher. While on his way thither, Surgeon M'Crea was severely wounded in the right breast by a bullet notwithstanding which, he continued to perform his duties at the ambulance, and again assisted to bring in several wounded men, continuing afterwards to attend the wounded during the remainder of the day, and scarcely taking time to dress his own wound, which he was obliged to do himself, there being no other medical officer on the field. Had it not been for this gallantry and devotion to his duty, on the part of Surgeon M'Crea, the sufferings of the wounded would undoubtedly have been much aggravated, and greater loss of life might very probably have ensued." Surgeon M'Crea who has thus gained this coveted decoration, was a student of Guy's hospital.

Changes in the Population of Ireland.

THE Registrar-General for Ireland in his latest weekly report says that in 1871 the total population of the Dublin Registration District and the fifteen Provincial Urban Sanitary Districts embraced in his returns was 794,732; it appears that at the date of the recent Census the inhabitants of these localities amounted to 844,793, being an increase of 50,061 or 6.3 per cent. The increase in the Dublin District was 16,105 or 4.8 per cent. (1.7 per cent. in the city and 13.6 per cent. in the suburbs), and the net increase in the provincial urban districts, 33,956 or 7.4 per cent. the population having increased in Dublin city and each of its suburban districts, and in Belfast, Londonderry, Newry, Dundalk, Sligo and Clonmel, and decreased in Cork, Limerick, Waterford, Galway, Drogheda, Kilkenny, Wexford, Lurgan, and Queenstown. The greatest proportional increase in any of the fifteen provincial urban districts was in Belfast, 33,259 or 29.1 per cent.; and the greatest proportional decline was in Drogheda, namely, 944 or 7.4 per cent. The increase in Sligo was only 0.9 per cent., and the decrease in Cork and Wexford only 0.4 and 0.2 per cent. respectively.

Legalised Vivisection.

A HOUSE OF COMMONS return just issued shows the number of experiments performed on living animals during the year 1880 by medical men and others licensed under the Act. The experiments were in most cases performed at laboratories connected with the universities in England and Scotland, or at hospitals or veterinary insti-

tutions. The experiments numbered 311, of which only 114 can have been the cause of any pain, and of these all but 17 were of a kind involving no more pain than is experienced by ordinary vaccination. The painful part of the proceeding in the 17 cases involving pain was made under *æsthesia*, and no appreciable suffering can be said to have been inflicted beyond confinement until the wounds healed or until the animals were killed. The most important results have been acquired in the elucidation of an obscure and fatal disease termed anthrax, which attacks sheep and cattle, and also persons engaged in wool sorting. Of this series of experiments 29 were undertaken at the instance of the Royal Agricultural Society, and 40 at that of the Medical Department of the Local Government Board.

A New Faster.

CHICAGO is happy now in the possession of the latest candidate for fasting honours in the person of a man named Griscom. This individual, is pursuing a voluntary abstinence, and, by latest advices, had accomplished sixteen days successfully. His daily consumption of water amounts to two pints, and we are told that arrangements are made for the regular examination of his excreta. A physician is in constant attendance, accompanied by one or more reporters from the Chicago press, and so far as information is afforded, precautions against fraud are very effectually ensured. With the "Tanner" performance, however, fresh in mind, it is impossible to avoid something like misgiving in respect to the scientific value of any experiment of this kind, though why it should not be quite faithfully conducted is not at all easy to see. There are a good many details of the Chicago faster that encourage a feeling of confidence in him nevertheless. Thus he is reported to have lost, during the sixteen days, a weight of twenty-five and a quarter pounds, the loss at the thirteenth day having been three quarter pounds less. His initial weight was one hundred and ninety-seven and a quarter pounds. It is hopeful, too, that the experiment is not being made a money concern, visitors being excluded from witnessing it. At the end of the sixteenth day the mind was reported unaffected, temperature normal, and heart and blood showing nothing abnormal.

A Rolleston Memorial.

IMMEDIATELY after the funeral of the late Professor Rolleston at Oxford, an informal meeting of his old pupils and friends was held at the University Museum to consider what means should be taken to perpetuate his memory, and a committee was then formed to commence the work of executing a fitting memorial. In connection with this a meeting is convened for to-day (Wednesday), at the house of Dr. Shepherd, 17 Great Cumberland Place, W., at 3 o'clock, to which all friends and pupils of Dr. Rolleston are invited. The committee will, doubtless then, be in a position to make some definite proposition, and the further fulfilment of the scheme will be indicated. We would commend to the consideration of this meeting an admirable suggestion made in the *Students' Journal* of Saturday last, to the effect that the memorial should take the form of a scholarship or prize tenable at any

metropolitan hospital, and open to competition at Oxford each year, among the students proceeding from the university to a hospital. We feel sure this would be a most popular prize, and even though a sum of money is collected too small to found a scholarship, this need not be preventive of carrying out the plan in some form. The excellent sketch of the late Professor, made by Mr. Miller in 1877, might possibly be reproduced. It would be carefully treasured by every one who was fortunate enough to be amongst Rolleston's friends.

The College Election.

THE election of three Fellows of the Royal College of Surgeons of England to fill the vacancies on the Council, will take place to-morrow, Thursday, the 7th July. We have little to add to what has already been said in these columns on the election, but that a sharp contest will ensue, for, at any rate, the third place is certain. We could feel a more direct interest in it if we felt any assurance that a new election meant a tendency to sweep away the old anomalies of the College; past experience, however, hardly helps to justify the conclusion, and we must be content to wait patiently till such time as the voice of public opinion in the profession compels the removal of abuses from the College. That the election to-morrow will result in the success of three good men is certain from the character of the whole list of candidates.

Death of Dr. Peatson, of Manchester.

WE regret to learn that Dr. Joseph Peatson, of Manchester, died during the past week somewhat suddenly. The deceased was in practice in Manchester, and had been, for a long number of years, connected with the Lock Hospital of that city, where he was affectionately regarded by a large circle of personal friends. Though but rarely a contributor to medical literature, Dr. Peatson yet did a considerable amount of valuable work, and leaves behind him a large collection of manuscript material, which, it is hoped, may be utilised for publication.

Myopia in Schools.

IN consequence of the alarming extent to which myopia is increasing in schools in France, a special commission has been nominated by the Minister of Public Instruction, the duty of which will be to pay attention to the influence exerted by school arrangements on the progress of myopia. It will also be required to suggest means for removing the evil under which school-children in France now suffer, and generally to report on the topics associated with the subject. The commission is named "De l'Hygiène de la vue dans les Ecoles."

Superannuation.

ON Thursday week, Mr. Dodson stated, in the House of Commons, in answer to Mr. Sclater Booth, with regard to certain anomalies in the superannuation of Poor-law officers, that some amendment of the law was required. At present the matter was within the discretion of the guardians, and the Local Government Board could not interfere.

Salivary Globules.

Nature records that Stricker's examination of salivary globules, under high powers of the microscope, leads him to reject the supposition of so-called Brownian (molecular) movement in salivary corpuscles. He finds the globules possess a complete, distinctly visible, network, and the granules, hitherto described, are thickened points of intersection of the threads forming the reticulum. During the life of the corpuscle, there is permanent fluctuation of the threads, which, under the influence of concentrated solutions of salt, ceases, the reticular arrangement, at the same time, disappearing.

Patients in Irish Workhouses.

In the House of Commons on Tuesday week, Mr. A. Moore moved for a return of the number of patients attended in Irish workhouse infirmaries and fever hospitals during the past year; of the number of paid and pauper nurses, and the average number of lunatics and idiots in the workhouses. The return was ordered.

WE understand that H.R.H. the Prince of Wales will visit Brighton to open the Children's Hospital at Brighton on the 21st inst. His Royal Highness has not visited the town since 1866.

THE *Citizen* states that small-pox has broken out at Holloway Gaol, but the sufferers, few in number, were promptly removed to hospital, the Home Secretary remitting their terms of imprisonment, which were short.

A TELEGRAM, received at Toulon, announces that yellow fever prevailed, with great severity, at Martinique. The hospital at Fort de France was full of patients, and the epidemic was expected to continue until the setting in of winter.

ON the occasion of the International Medical Congress being held in London, in August, the Court of Common Council has resolved to invite the members to a *conversations* in the Guildhall, at an expense not exceeding £2,000.

A MEDICAL paper at Leipsic has been fined 100 marks and costs, at the suit of 75 homœopathic doctors, for publishing a lecture delivered to a Berlin medical society in which homœopathy was denounced as quackery and swindling.

THE annual rates of mortality last week in the principal large towns of the United Kingdom per 1,000 of the population, were—Plymouth 9, Wolverhampton 11, Nottingham 13, Sunderland 14, Brighton 14, Hull 14, Salford 15, Oldham 15, Newcastle-on-Tyne 16, Leicester 16, Portsmouth 17, Bristol 17, Edinburgh 17, Glasgow 18, Birmingham 18, Leeds 18, Manchester 18, London 19, Sheffield 20, Bradford 20, Norwich 21, Liverpool 23, and Dublin 24.

THE general fatality of measles, scarlet fever, and fever showed a decline, and was considerably below the average last week in the large towns. The 31 deaths from diph-

theria included 14 in London, 8 in Glasgow, and 6 in Portsmouth. Small-pox caused 93 more deaths in London and its outer ring of suburban districts, 4 in Liverpool, one in Bradford, but not one in any of the other large towns.

IN the principal foreign cities the rates of mortality according to the latest official weekly return, were in—Calcutta 23, Bombay 38, Madras 39; Paris 24; Geneva, 13; Brussels 22; Amsterdam 24, Rotterdam 16; The Hague 25; Copenhagen 19, Stockholm 23, Christiania 23; St. Petersburg 62; Berlin 26, Hamburg 22, Dresden 23, Breslau 29, Munich 33; Vienna 32; Buda-Pesth 35; Turin 26; Venice 25; Alexandria 32; New York 28, Brooklyn, 19, Philadelphia, 18, Baltimore, 17 per 1,000 of the various populations.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

PUBLIC MEDICAL APPOINTMENTS—VACANCIES DECLARED.—Vacancies in the office of physician and surgeon to the Royal Infirmary, Glasgow, and that of teacher of anatomy, physiology, medicine, materia medica, midwifery, pathology, and mental diseases, are officially declared, and applications invited by the profession. It is high time that the profession should understand whether these announcements are to be received as a farce, or treated as seriously as their nature would seem to justify. It is neither more nor less than a deliberate insult to the profession to declare such vacancies, and put candidates to the trouble and expense which a candidature entails if the conclusion is a foregone one, that the retiring occupant of the office is to be re-elected *ad infinitum*. The man who, during five years, has manifested no special suitability for the position occupied, should certainly not be re-elected. He has no claims whatever, either on the directors or the public, and simple nepotism should not be brought prejudicially to operate on a noble field for the cultivation of medical science. It is alleged that the directors of the Royal Infirmary, by thus declaring vacancies at the end of every five years, command the power of dropping an unsuitable occupant of any given office; and it is reported that on the present occasion they are anxious to get rid of Dr. Fleming, and one or two other pronounced failures as lecturers. This may be highly commendable in itself; but under a general invitation to the profession to apply for these vacant situations, the object, however good, is only achieved, if at all, at the expense, possibly, of very general insult. We advise the profession to treat these announcements, emanating, as they do, from the directors as genuine, and to make application accordingly. To refrain from doing so simply constitutes and perpetuates a rule distasteful to the profession. The office of extra-dispensary physician to the Western Infirmary is also announced as vacant. It is not likely that there will be many applications for it, as it is understood that Dr. Brock, having paid his homage to the clique for the statutory period, has been admitted into the confraternity of the professional saints, and will thus, as his reward, receive this sop.

COMBÉ LECTURES.—On the 28th ult., Dr. Andrew Wilson delivered another of this course of lectures in the Church of Scotland Training College, Chambers Street, to a large audience of ladies and gentlemen. The lecture was mainly devoted to a description of the working of the valves, which

be illustrated by means of a bullock's heart. In speaking of the nervous regulation of the heart, Dr. Wilson took occasion to refer to the valuable knowledge which had accrued to physicians from experimentation upon live animals.

EDINBURGH.—MORTALITY OF THE CITY.—The number of deaths in Edinburgh for the week ending with Saturday the 25th ult, exclusive of six country deaths, was 72, equivalent to an annual mortality of 17 per 1,000. In the previous week the number was 114, and in the corresponding week last year 84. Five fatal cases of scarlatina, and 8 of whooping-cough were reported from the Old Town, and 1 of scarlatina, 1 of measles, and 1 of whooping-cough from the New Town. The Southern suburbs continue free from zymotic disease.

GLASGOW BRANCH OF THE BRITISH MEDICAL ASSOCIATION.—At the recent meeting of this Association Branch at Glasgow, the constitution of the Medico-ethical Committee, prepared by the Council, was submitted for approval, and after adjustment unanimously adopted. *Inter alia* it states that "It shall be the object of the committee to promote fair and honourable practice, to exercise a judicious supervision of matters touching medical interests, and, by its moral influence to prevent abuses in the profession." Dr. Joseph Coats and the Junior Mystic (Dr. James Finlayson), are prominent members of this branch of the British Medical Association; and when one considers the avowed objects of the Medico-ethical Committee, and the attempt, not very long ago, made and repeated, to professionally damn a professional brother—for what! The commotion said to agitate celestial circles on the return of the penitent is vividly suggested.

KILMARNOCK FEVER HOSPITAL.—Lady Harriet Bentinck, who lately succeeded to the Portland Estate at Kilmarnock, has sent a donation of £200 to the Extension Fund of the Fever Hospital and Infirmary.

THE ALLEGED THEFTS BY A MEDICAL STUDENT.—On Saturday the 25th ult., the Edinburgh Detective Department in the course of their inquiries regarding the diploma forms found in the possession of Cecil George Paul, the medical student, to whose case we referred to in our last issue, ascertained that in April last he got these printed on vellum by a firm in town, and paid £3 for ten copies. Shortly afterwards, it is said, he gave the same firm an order for fifty copies of the first examination certificate forms, seven of which were found in his lodgings. Towards the end of April he is alleged to have produced to the printer who received the above orders a seal which bore to be that of the Faculty of Physicians and Surgeons of Edinburgh, and ordered one similar, stating, however, that as he was going to study in Glasgow he desired the name of that city to be substituted for Edinburgh. The seal has the appearance of having been used, and as there are seven of the diploma forms and forty-three of the certificate forms missing much anxiety is felt by the medical profession regarding the matter. From inquiries made at Glasgow, it has been ascertained that the diploma forms bear no resemblance to the genuine ones issued there, although the seal is similar in appearance to the one which was in use there prior to 1864.

A HUSBAND'S LIABILITY FOR MEDICAL ATTENDANCE ON HIS WIFE.—Sheriff-Substitute Hallard has given judgment on the case raised by Dr. Wielobycki, George Square, Edinburgh, to recover £107, as the balance of his account for medical attendance upon the wife of Isaac Atkinson, tailor and clothier, St. Andrew Square, Edinburgh, residing at Portobello. The account extends over the period from December 1871 to March 1881, and the sum sued for was the balance of £128, after deducting £21 received at different times to account. Payment was resisted on the ground that the defendant had never

employed Dr. Wielobycki, and that the doctor had made the attendance solely on the personal credit of Mrs. Atkinson, who had separate means exclusive of his (defendant's) rights as husband. The Sheriff-Substitute, after having considered the evidence which was led on 15th current, has given decree against the defendant for £90, and expenses.

Literature.

TWO THEORIES OF "ZYMOTIC DISEASES." (a)

NOT the faintest trace of evidence presented itself in favour of the presence of bacteria or other foreign organisms in the blood of cholera. All the phenomena observed by microscopic examination were ascribable to alterations, relative or absolute, in the normal elements of the blood; not to the presence of any new or extraneous bodies of such a nature as to be detected by microscopical research. We are well aware that these statements are likely to be received with some incredulity by a large number of the members of the medical profession, made as they are at a time when views regarding the important and almost necessary influence of germs, bacteria, microzymes, &c., in the development of epidemic disease are so widely diffused and so much quoted. Bacteria may be found in specimens of blood obtained from the bodies of animals killed while in full health. With the high temperature of the hot months (in India), a development of bacteria may take place within a very few hours in the blood of animals into the system of whom no such bodies had been previously artificially introduced. The results of experiments do not manifest that freedom of the healthy tissues and fluids from the elements of bacteria which is maintained by some of our most distinguished observers. The occurrence of vibrios in the mesenteric glands in cases in which death had resulted on injection of choleraic fluids into the circulation was recorded. Similar organisms were observed in several specimens of blood obtained from healthy animals at intervals after death. Many authors use the word "microzymes" to include a heterogeneous mass of minute bodies, organic and inorganic, living and dead. There appears to be a tendency to assume on very insufficient grounds that such organisms are necessarily the causes of all diseases of an epidemic or communicable character, and consequently to recognise as vegetable parasites all minute particles of an undetermined nature occurring in the fluids and tissues in such diseases. It is possible that all the diseases ascribed to vegetable parasites may, in reality, be due to such organisms, but the proof of it has yet to be adduced, and it is no real advance to ascribe them to such an origin on insufficient ground. This theory has attractions for many on account of the apparently simple explanation which, if true, it would afford of the multiplication of disease poisons. Until it be proved that living substances can withstand immersion in a fluid at a temperature of 212° F. of some minutes' duration, we have no hesitation in stating that the morbid phenomena which we have observed to follow the introduction into the animal economy of strained solutions of choleraic and normal alvine discharges, and of other decomposing animal substances, are not the result of infection with a material, the poisonous properties of which are dependent on its possessing vitality.

Such are the results of a long series of carefully made and no less carefully detailed, experiments conducted in India. These particulars are given almost verbatim, as they occur in the tenth annual report by the sanitary commissioner at Simla, and they represent as nearly as possible the views entertained by a large number of medical men both in India and in England, as to what in brief is designated the true specific origin of certain epidemic diseases.

On the other hand, notwithstanding the results of these investigations, and of others equally demonstrative, there is in England a strong band of men, holding the very highest professional reputation, who maintain the opinion that certain forms of epidemic diseases, more especially fevers,

(a) 1. Tenth Annual Report of the Sanitary Commissioner with the Government of India. 2. Ninth Annual Report of the Local Government Board.

arise as a result of specific "poison" or "germs" of that disease being received into the system, and that they are propagated similarly by means of such poisons or germs multiplying in, and discharged from, the alvine canal of the affected person, being received into the system of others. To this key-note, as it were, the second report now before us is attuned. It may, therefore, be of interest to follow as briefly as possible the nature of the evidence therein brought forward in support of the views advocated. Between the 23rd September, 1879, and 23rd October of the same year, there occurred among 262 boys on board the *Cornwall*, 43 cases of some sort or degree of illness; 18 from decided—most of them serious—illness, with one death. Out of this number twenty-five other boys were slightly ill. Some of these may not have been ill at all, but owing to pain, may have imagined themselves so. All the serious cases—and some of the slighter ones—had a disease which was properly described as a "continued fever." In most instances the symptoms were clearly indicative of enteric disturbance; in some cases diarrhoea, rose-coloured spots, and hæmorrhage, to a greater or less extent, from the bowels. From these data the disease was regarded as one of enteric fever, presenting perhaps an unusual number of abortive cases, and possibly complicated with malingering. Accordingly, a search for causes of enteric fever was instituted, and with the following results. Dinner seemed to suggest a clue. Suspicion, once aroused, settled naturally on pork. If pork had had to do with the outbreak, some of that suspected might have been trichinised, and the disease, therefore, from which the boys suffered might not have been enteric fever at all, but trichiniasis. The theory of trichiniasis was accordingly put to the test of further inquiry, but no confirmation of it was at first to be found. Microscopic examination of the pork in the "harness cask" failed to find any trichina. The temperature charts of cases showed that beyond doubt many of the boys had suffered from continued fever; but as to the precise nature of that fever, they gave no information. It did not seem that trichiniasis could be set aside, though evidence affirmative of it was thus far wanting. It became increasingly evident that a large proportion of the fever cases might be more safely ranged under some general name, such as "simple continued fever," than under the specific name of enteric fever. Application having been made to the Home Office, the body of the unfortunate boy who had died was disinterred, and submitted to further examination, and the search for specific organisms resumed. No such anatomical changes as are characteristic of enteric fever towards the end of the third week were found. But in the fibres of the abdominal muscles was found a wandering living trichina, and further search discovered these parasites in large numbers in the muscles examined. Doubt could no longer exist that the boy died from acute trichiniasis. The boy had on one occasion received from his home a small piece of fresh roast pork; it was a remnant of what had formed the dinner of his mother and sister, neither of whom had subsequently suffered from any illness. This being so, "it seemed inevitable that the American pork on board the *Cornwall* was the source whence the trichina disease had been derived." Yet no affirmative statement on points in relation to this supposition could be justified. Among the outcomes of inquiry, it was stated that one of the most important is the circumstance that an outbreak of trichiniasis has, in many respects, sped an outbreak of enteric fever. Although, however, symptoms doubtless referable to trichiniasis could be elicited from many of the boys, still such symptoms had been very imperfectly developed. No better designation for the majority of the cases (pathology apart) could be found than "simple continued fever." Then follow details; first, of "symptoms observed during the outbreak that might have been referable to enteric fever." In the second of that might, in an outbreak of trichiniasis, be expected, but which, in the *Cornwall* outbreaks, were by no means prominent. In the third, on "some nematoids found in the body of the boy who died on board that vessel." The significance of the latter remarks is enhanced by comparison with those an abstract of which has already been given. Thus it is observed (p. 68) that the outbreak was first looked upon as one of enteric fever, with perhaps an unusual number of abortive cases, and possibly complicated with malingering; that subsequent inquiry tended to discredit the notion that the disease was of the nature of typhoid fever, and led to the suspicion that it might have been one of trichiniasis;

yet that careful inquiry "failed to elicit information suggestive of trichiniasis, and failed to a like degree to support a theory of enteric fever." Then comes the statement (p. 71) with reference to the specimens previously described; that an "examination" of them had convinced the very eminent microscopist to whom they were submitted "that the parasite is not trichina spiralis, but a new nematoid not previously encountered within the human body." The new form alluded to "is most closely related to the genus *Rhabditis*, and to those of the genus *Pelodera* (p. 72). In the genus *Pelodera* three forms are recorded as being found in damp earth and decaying substances. In the spring of 1866 some earth was taken—a kind frequently examined before without its yielding any nematoids; a small piece of uncooked mutton, about the size of the top of a finger, buried therein, the mutton previously examined without finding any nematoids. In the course of a few weeks the earth and mutton were found to be swarming with minute nematoids, which, if not belonging to the genus *Pelodera*, were some closely allied forms. In respect to the latter point the observer added that he was "not quite certain" (p. 74). What, then, are the actual points brought into prominence by the particulars thus briefly summarised? They are the following, namely, that in the latter part of the autumn season a certain number of boys suffered from simple continued fever, some with, others without, bowel disorder, but in all respects similar in nature to attacks such as affect boys, and girls also, during that particular season. But in supercession of such simple explanation, a search took place for causes specific in their nature. First, the disease was complicated with malingering; then it was trichiniasis; then it was not trichiniasis; then it was from presence of a "new nematoid," and finally the "new nematoid found in the tissues of a body that had been interred during some six weeks or so, were declared to be the same as, or a form allied to, others found in healthy mutton after three weeks' interment in clean earth. To such lengths do modern theories carry their faithful votaries.

No less startling are the conclusions arrived at with regard to another outbreak of fever, a minute report of which immediately follows. In January, 1879, a sudden outbreak of fever occurred in Caterham Valley and Redhill. During that month and February the number of cases recorded was 352, of which 21 proved fatal. As the result of some inquiry the belief (p. 78) was entertained that the disease had been conveyed by means of the water supplied by the Caterham Water Works. Of 47 persons attacked during the fortnight January 19th to February 2nd, 45 resided in houses supplied with water by that company. At Redhill, of 96 houses infected, 91 drew their water supply from the company's mains. Thus, it is added (p. 81), all the facts ascertained afforded very strong presumption that the outbreak had been caused by that water; and then follows (p. 84) in detail an account of the circumstances upon which that relief was based. During the latter part of 1878, and beginning of 1879, the Caterham Waterworks Company constructed an adit from one of their old wells up to the new bore, which was then being sunk. The adit was 455 feet deep in the chalk, six feet by four in diameter, and ninety feet in length. J. K., a man, æt. 32, worked in the adit as a "loading man," he being employed in attaching to a rope let down from above, the buckets by which the excavated chalk was raised to the surface, and in again receiving those buckets, when lowered, full of bricks and cement required for the work in progress. J. K. was discharged on December 14th, but resumed his work on the 29th of the same month. When he returned to work he was in perfect health. On 5th January he suffered from loss of appetite, recurring attacks of shivering, alternating with a feeling of heat, aching all over, and diarrhoea. Subsequently he suffered from giddiness. His diarrhoea compelled him to evacuate several times while in the adit, his "shift" of work at a time being from eight to twelve hours. So matters went on until January 20th, when work stopped. On the 21st he was unable to get out of bed. He had spent the 26th and 26th December, 1878, at Croydon, but the evidence of his having been "exposed to the poison of enteric fever" at that place was entirely negative. It was also incomplete and unsatisfactory (p. 86), and yet the circumstance was taken as a fact that J. K. had been ill with enteric fever while working from 5th January till the end of the month in the adit as already described. According to his statement (*id.*) he had used the bucket as a closet when it was

empty, when half full, and when full. When full, he however first took out some of the chalk. He admitted that in its descent the bucket occasionally came into somewhat violent contact with the walls of the wells, and that "some portions of his emanations probably did so also." The bucket, which was merely emptied out above, then received materials for the works below (p. 37). "Here, then," it is added, "were the stools of an enteric fever patient, from about January 5th onwards getting into the Caterham Company's water, and distributed with the water to the district served by the company."

What are the circumstances that present themselves in connection with this case? An absolute want of evidence that J. K., either had enteric fever or that prior to his illness he had been exposed to infection of specific fever of any kind; consequently the conjectures based upon either theory necessarily give way. As examples of special pleading to indicate a foregone conclusion, the Reports herein alluded to are peculiarly suggestive and valuable. But they so completely dwell upon this one phase of etiology of the diseases indicated to the relative neglect of other circumstances related thereto, that for the time being there is much reason to fear that in this respect real progress in these respects has undergone a check.

Correspondence.

THE PRESIDENCY OF THE ROYAL COLLEGE OF SURGEONS OF ENGLAND.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Whilst agreeing with your able defence of Mr. Erasmus Wilson's claims to the Presidency, and your condemnation of the *Lancet* for its "irresponsible frivolity" and ignorance in the matter, permit me to quote the following from the columns of your contemporary of Saturday last. The writer would seemingly have discovered that he had trodden on dangerous ground, and wished to get out of the dilemma by a strong infusion of assurance and soft soap.

He now says, "his (Mr. Erasmus Wilson's) services to the College have, in the past, been so conspicuously unselfish that we shall not be surprised, if, at the last moment, he voluntarily waives his claim to the Presidency of the College this year. In 1869 he not only gave the sum of £5,000 to found a chair of Dermatology, but accepted the duties of professorship himself, and discharged them for nine years, and to show that it was no favour, received regularly the yearly stipend of the College."

Does this mean that Mr. Wilson invested £5,000, and drew the interest on his own money? Were there any other advantages from holding a chair at the College?

The writer then adds:—"When Mr. Wilson ceased lecturing, the Council resolved, with Mr. Wilson's sanction, to abolish the professorship. To Mr. Wilson belongs the honour of not only founding a Chair of Dermatology, but of being the first and only professor of this subject the College has ever had, or is likely to have."

After Artemus Ward, we ask, "Is this writ satiric?" If serious, then Mr. Wilson may say, "Save me from my friends."

Interpreted mischievously, the paragraph implies that Mr. Wilson helped to blow his own trumpet, and then, lest any one else should use the instrument, broke it, which insinuation is, to those who know Mr. Wilson best, simply despicable.

The *Lancet* speaks of Mr. Wilson's "ingenuous disposition." If this paragraph be true, the adjective might be changed by adding another letter to it.

There is a story told of this eminent dermatologist, which, if not true, is *ben trovato*. When he first devoted his attention to skin disease, he is said to have asked the advice of the proprietor of the *Lancet*, the late Mr. Wakley, as to how he was to proceed to fame. That astute man of the world observed: "Write about Skin, lecture about Skin, talk about Skin, until you become so connected or associated with the subject, when you enter a room all the ladies and gentlemen will begin to itch, and scratch themselves."

I have the honour to be, Sir,

Yours obediently,

A FELLOW OF THE COLLEGE.

Obituary.

DR. LITTLE, OF LIFFORD.

THE announcement of the death of the above gentleman, which took place last week at his residence, Combermore House, Lifford, will be received with regret in Donegal, Tyrone, and Derry, but more especially in the former county, where he was extensively known and universally esteemed. Although able to attend to his professional duties up to within a day or two of his death, it was apparent to the immediate friends of Dr. Little for some time past that he was not in that robust state of health which he usually enjoyed; but beyond this slight indication of failing strength, so early a termination of life was entirely unexpected, his age being only sixty-seven. Dr. Little was an Arts graduate and M.B. of Dublin University, and a Fellow of the Irish College of Surgeons of the year 1844. He held formerly the situations of dispensary doctor and physician to the district fever hospital in Letterkenny, and on being appointed physician and surgeon to the Donegal County Infirmary and County Prison he moved to Lifford, where he succeeded to an extensive and lucrative practice, and resided for over twenty-five years. He was eminent in his profession, and as an operating surgeon had few equals. In private life he was known as a warm-hearted and genial friend, and gained the friendship of a very wide circle of acquaintances. He contributed to the *Medical Times* a paper on the cure of Subclavian Aneurism by Manipulation, and to the *Dublin Hospital Gazette*, a case in which he excised two-thirds of the Inferior Maxilla.

Medical News.

University of Dublin; School of Physic.—At the Trinity Term examination for the degree of Bachelor in Surgery (B.Ch.), held June 20 and 21, the following candidates passed in order of merit as under:—

Jenekan, Francis John.
Irwin, James M.
Young, L. uls T.
Myles, Thomas.
Donnelly, Thomas.
Grant, Donald St. John.
Hull, Edward G.
Elliott, William S.

Nangle, Edward C.
MacCarthy, William F.
Macgulligan, John W.
O'Hara-Hamilton, Thomas W.
Robinson, James J.
Miller, Alfred.
Gloster, Charles.
Moore, Reginald H.

Cochrane, Edward.

Royal College of Surgeons of England.—The following candidates were admitted Licentiates in Dental Surgery of the College at a meeting of the Board of Examiners on the 27th of June.

Amoore, John S.
Davis, Charles D., M.R.C.S.
Ewbank, Francis, M.E.C.S.,
Harris, U.A.C., M.B.C.S.,
Here, William.
Mathews, William.
Oakley, Archibald H.

Pidgeon, William J.
Price, Rees.
Rose, Frederick.
Stuck, Thomas J.
Toshill, Walter.
Trueman, Charles E., M.R.C.S.,
White, Henry F.

College of Physicians in Ireland.—At the June examinations the following obtained the licences in Medicine and Midwifery of the College:—

MEDICINE.—Thomas Hobbs Crampton, Charles James Douglas, Robert James Fayle, Michael Edward Fitzgerald, Thomas Geary, Patrick Joseph Austin Kelly, Daniel Francis Butler Reardon, James Steele Swan.

MIDWIFERY.—Thomas Hobbs Crampton, Charles James Douglas, Michael Edward Fitzgerald, Thomas Nunan, Daniel Francis Butler Reardon, James Steele Swan.

The undermentioned Licentiates have been admitted Members:—

Peter Aloysius Cutler, Alexander Samuel Faulkner, William Carroll, William Doyle.

Sanitary Institute of Great Britain.—At an examination held by the Sanitary Institute of Great Britain on June 2nd and 3rd six candidates presented themselves, and the Institute's certificate of competency as local surveyor was awarded to Samuel S. Grimley and to Arthur Whitcombe; and the Institute's certificate of competency as an inspector of nuisances was awarded to John Tatem Cowderoy, to Joseph Rains, and to William Wilkinson.

NOTICES TO CORRESPONDENTS.

CALF LYMPH.

In reply to the letter of Mr. Collins in our last issue, we have received letters from Dr. Worlombot, Dr. Wyld, Dr. Drysdale, and Prof. George Fleming. This correspondence, which is unavoidably held over this week in consequence of the Index, will appear in our next.

INQUIRE.—It is a fact that a medical man has voluntarily exposed himself to the bite of a rattlesnake. He nearly lost his life in consequence. The same medical man has since allowed himself to be bitten by a coral snake without any poisonous effect. His method of preparing himself to render a bite harmless will doubtless be reported in full after some further experimentation.

MR. WELLSTED.—1. The *National Anti-Compulsory Vaccination Reporter* is edited by Mrs. Hume-Rothery, of Cheltenham. 2. We are not aware of the existence of the other publication named.

SANTAS.—The idea is not a new one, on reference to our columns for April 20th you will see we have been anticipated.

M.A. OXON.—The Sanitary Company to which you refer is started under good auspices, but we cannot give any details as to its suitability as a pecuniary speculation. Public companies are all more or less a risk.

DR. JENNINGS.—We don't think any one entertains the hope that the Medical Act will be touched this Session.

DR. J. E. R.—It is a matter of discretion with the authorities. A question to the same effect was put in the House of Commons on Friday last when Mr. Dodson stated that persons once fined under section 81 of the Vaccination Act were not liable to be again fined within twelve months on the same order, but a magistrate had power, when the first order had not been complied with, to make a fresh order. The Local Government Board had, he said, pointed out to the local guardians their discretion in the exercise of the power of instituting repeated prosecutions.

ATLAS has been replied to in a private note.

A MEDICAL OFFICER OF A WORKHOUSE asks: 1. Is the medical officer of a workhouse subordinate to the master of the house? 2. Has the medical officer the power of removing a pauper attendant from his wards in cases of irregularity without applying to the master, or, if not, how is it to be done in case the master refuses to remove the attendant? 3. In case of any irregularity on the part of the attendants or others in hospital is not the nurse bound to report the matter to the medical officer when making his rounds?

1. Certainly not. The medical officer is, in his own department, responsible to no one but his Board of Guardians and the Local Government Board. 2. The medical officer has a right to suspend a ward attendant subject to the approval of his Board, and the master has nothing to say to the matter. 3. Certainly, and the nurse should not be retained if she omits this part of her duty.—ED.]

F.R.C.S.—It is a fact, and what is not a little extraordinary, the patient recovered after the operation. We are promised details of the case shortly.

ONE WHO SUFFERS FROM THE SYSTEM.—We are collecting information from all parts, and intend devoting a series of articles to the subject shortly.

PATHE.—Your bookseller has rightly informed you, the number is out of print.

DR. BENNETT.—The subject occupied Mr. Jonathan Hutchinson's sixth lecture. It will appear in our columns in due course.

AN ANXIOUS ONE.—Yes, the climate is bracing and the water good; the sewage nuisance has been removed by an excellent system of drainage.

ABUTUS asks: Will you kindly tell me when a patient dies, whose life has been assured, say for £1,000, and when called on to fill the certificate of cause of death, &c., for the insurance company, is it the custom of the medical attendant to claim a fee, and if so, what is the usual amount, and who is liable—office or executors?

[A death certificate must be given to the registrar of deaths for the district under 26 Vic., cap. 11, Sec. 46, and the insurance company may obtain a copy of this registration at a nominal cost. If a special certificate is required a fee should be paid by the executors, or by the company if the demand for it comes from them.—ED.]

NEWSPAPER PARAGRAPHING.—A correspondent sends us the *Morning Post* of Friday, July 1st, in which the following announcement appears: "Sir Benjamin S. Phillips, having completely recovered from the effects of the recent operation performed upon his tongue by Mr. John Astley Bloxam, has left his residence in Portman Square for 18 Queen's Gardens, West Brighton." Our correspondent wishes to elicit our opinion upon what he styles "a bad form of quackery." In this expression we should coincide did we imagine Mr. Bloxam had himself sent, or caused the paragraph to be sent, to the newspapers; but we opine such would not be the case. It bears upon it the stamp of that "irresponsible frivolity" which gossiping paragraphs in the so-called fashionable papers generally betray.

SURGEON.—The appointments of Surgeon on board ship are generally made for longer voyages than your vacation admits. Your only chance is by writing to the Secretary of two or three of the Atlantic Companies at the Liverpool offices, offering your services. Otherwise you had better advertise in the shipping-papers, or the *Times*' newspaper.

LEX asks: 1. I am summoned as an ordinary witness in an assault case, am I obliged to give evidence without a fee. Can I refuse giving evidence unless my fee is forthcoming? 2. Kindly at same time to inform me are the clerks of unions obliged to notify the coming of

auditors to the medical officers of workhouses in order that they may prepare their sickness and mortality books?

1. If the case is a police prosecution you must attend and you will get the regulation fee from the Castle. If it is a civil action you are technically obliged to attend, but if your fee is not secured you may absent yourself without much risk of consequences. If you attend and are sworn in you must give evidence, but may appeal to the Judge who, probably, will not order you to testify unless you are paid.—ED.]

OBSTETRICAL SOCIETY OF LONDON.—This (Wednesday) evening, at 8, Specimens will be shown by Mr. Heath, Dr. Godson, and others.—Mr. Braithwaite, "Non-capsulated Fibroids resembling Retained Placenta."—Dr. Galabin, "On a Case of Cancer of Cervix, followed by Septicæmia, with symptoms resembling Diphtheria."—Dr. Godson, "On four Cases of Spasmodic Dysmenorrhœa with Sterility, successfully treated by Dilatation."

OPHTHALMOLOGICAL SOCIETY OF THE UNITED KINGDOM.—This evening, at 8.30. Annual General Meeting for Electing Officers and Council and receiving Treasurer's Report.—Mr. J. E. Adams, "On Endocarditis, with Embolic Panophthalmitis."—Dr. A. Bralley and Edmunds, "On Certain Ocular Changes in Bright's Disease and Similar Changes from Local Causes."—Mr. Snell, "Hemeralopia, with Patches on Conjunctiva."—Mr. Spencer Watson, "On Intraocular Tumour, ending fatally six years after Excision of the Eye."—Mr. Nettleship and Dr. Edmunds, "On Central Amblyopia in Diabetes; Microscopical Examination."—Mr. Nettleship and Dr. Fox, "Sequel to a Case of Multiple Growths on Irides."—Dr. Knaggs (by Mr. Swaney), "On a Case of Vaccinal Ophthalmia."—Living Specimens and Card Specimens at 8 o'clock.—Mr. Brudenell Carter: Result of Ophth. Neuritis from Injury to Head. Mr. McHardy: Case of Persistent Hyaloid Artery. Mr. Miles: (1) Specimens of Disease of the Vitreous; (2) New Instruments.

THE "PRACTICAL TREATMENT OF DIPSOMANIA."—The discussion of Dr. Alford's paper on this subject has evoked such considerable interest that it was again adjourned until Friday next, at 4 p.m., in the rooms of the Medical Society of London, 11 Chandos Street, Cavendish Square. Dr. Richardson will preside. Dr. Alford's paper will be found in our issue for June 8. All interested in the subject are invited to attend.

Vacancies.

Charing Cross Hospital Medical School.—Applications for the newly created Chair of Practical Physiology to the Dean before Wednesday, July 13.

Kilkenny Union, Tiscotin Dispensary.—Medical Officer. Salary, £160, and £20 as Medical Officer of Health. Election, July 18.

Stockton-upon-Tees Hospital.—House Surgeon (non-resident, doubly qualified. Salary, £200 per annum. Applications to the Secretary by August 9.

St. Bartholomew's Hospital.—Two Casualty Physicians. Particulars obtainable of the Clerk. Applications to be sent in by July 8.

East London Hospital for Children.—Resident Medical Officer. Salary, £200, with board. Applications to the Secretary at Shadwell, E., before July 18.

Somerset Lunatic Asylum.—Medical Superintendent. Salary, £500, with furnished residence. Applications to the Clerk at Wells, Somerset, endorsed "Superintendent Candidate," before July 20.

Newton Abbot Union.—Medical Officer for the 12th District. Salary £40, with the usual extras. Applications to the Clerk by July 11.

Omagh Union.—Medical Officer. Salary, £100. Election, July 16.

South Dublin Union, Donnybrook Dispensary.—Medical Officer. Salary, £125, and £30 as Medical Officer of Health. Election, July 12.

Appointments.

BARNETT, C. F.R.C.S.E., Medical Officer for the Third District of the Bath Union.

BATHEBURY, E. L., M.B., M.R.C.S.E., Medical officer to the Berkhamsted District and Workhouse of the Berkhamsted Union.

BENHAM, H. A., M.B., C.M., Assistant Medical Officer to the Royal Lunatic Asylum, Dundee.

BORLAND, J., M.B., C.M., Medical Officer for the St. Peter's West District of St. Mary's (Inlington) Parish.

BRANFORD, H. S., M.B., M.R.C.S.E., Senior House Surgeon to the Torbay Hospital and Provident Dispensary.

CARSWELL, J., L.R.C.P.Ed., L.F.P.S.G., Physician to Anderson's College Dispensary, Glasgow.

Births.

CABLE.—July 1, at Royal Hill, Greenwich, the wife of G. H. Cable, M.R.C.S., of a son.

NORMAN.—June 28, at Horrabridge, S. Devon, the wife of W. H. Norman, L.R.C.P., M.R.C.S., of a son.

PIEY.—June 27, at Rydal Villa, Clevedon, Somerset, the wife of G. F. Price Pley, M.R.C.S., of a daughter.

RENNER.—June 29, at 80 Portadown Road, London, W., the wife of Charles Renner, M.D., of a son.

Deaths.

ATKINS.—June 26, Alfred Atkins, L.R.C.P.E., of New North Road, London, N., in his 68th year.

BRABAZON.—June 30, Julia Emily Ensell, third daughter of Dr. Brabazon, 12 Darlington Street, Bath, aged 22.

BRITTON.—June 25, at 16 Victoria Square, Clifton, Bristol, Eliza, the wife of Frederick Britton, M.D.

DAVIES.—June 27, at Yorktown, Surrey, William Davies, M.R.C.S.E., aged 75.

MURDOCH.—June 13, at Pembroke Road, Dublin, Sidney Murdoch, L.K.Q.C.P.I., aged 41.

THE INFLUENCE OF ALCOHOLIC DRINKS UPON HEALTH, UPON WORK, UPON DISEASE, AND UPON THE SUCCEEDING GENERATION. (a)

By ANDREW CLARK, M.D., F.R.C.P. Lond.,
Physician to the London Hospital; Consulting Physician to the
East London Hospital for Children, &c., &c.

DR. ANDREW CLARK prefaced his address, which he said was an informal one, by premising that his audience, crowded as it was, would agree with him that this question of alcohol was of the first importance to us as a nation and as individuals; and hence a great responsibility rested upon the shoulders of those who professed to come forward and speak upon it with authority. The first requisite was that such a person should know it; and the second, that in the desire to forward a particular cause, he should not be led away from a solemn and reverent love of the truth. Now he ventured to say that he knew something about this question. For twenty-five years he had been physician to one of the largest hospitals in this country (the London Hospital), and there, as elsewhere, it had been a part of his business in life to ascertain the influence which alcoholic drinks exercised upon health; and he had, with deep interest and attention, striven to get at the truth of the matter. In the first place, let him distinctly say that alcohol was a poison, as were also strychnia, arsenic, and opium; but in certain small doses strychnia, arsenic, and opium were useful in special circumstances; and in very minute doses alcohol could also be used without any obvious prejudicial effect upon health. He was not going to discuss what these minute doses were, save to say that they were very minute. A perfect state of health (and it was rarely to be found) could not be benefited by alcohol in any degree, and in nine times out of ten it was injured

(a) An address delivered on Thursday, July 7th, in the Hall, Great Portland Street.

by it. It could bear it sometimes without obvious injury, but be benefited by it *never*. He said this not as a total abstainer, though he earnestly hoped that all the rising generation would be. Instead of the ideal state of health which might be enjoyed, save for the nature of our surroundings, the sins of our parents, and our own sins, there was a sort of secondary health possessed by most of us, and what did alcohol do for this? He had two answers to give:—That this sort of health bore apparently with the alcohol better than the other, and sometimes seemed as if benefited by it: and this was exactly the sort of health that formed the great debating-ground of different people with respect to the use of alcohol. Second, there were some nervous people, always ailing, yet never ill—for whom he had a profound sympathy—who seemed to derive great comfort from alcohol, and to these he had sometimes said, "Take a little beer or wine, but take great care never to go beyond the minute dose." He did not defend this, but simply stated it to show what he thought. As to the influence of alcohol upon work, Dr. Clark went on to encourage his hearers to try the experiment of total abstinence, and observe the result in regard to work. Let them, however, try it fairly, and not allow themselves to be deterred from it by the evil prognostications of friends. He was certain that if this experiment were tried each individual present would come to the conclusion that alcohol was not a helper of work, but, on the contrary, a hinderer. Now, as to the effect of alcohol upon disease: He went through the wards of his hospital to-day, and asked himself how many cases there were due to natural and unavoidable causes, and how many to drink, and he came, after careful thought, to the conclusion that seven out of ten owed their ill-health to alcohol. He did not say that these were excessive drinkers or drunkards. In fact, it was not the drunkards who suffered most from alcohol, but the moderate drinkers who exceeded the physiological quantity. The drunkard very often was an abstainer for months together after a period of intemperance, but the moderate drinker went steadily to work undermining his constitution, and preparing himself for premature decay and death. He had no means of finding out how many

victims alcohol claimed each year, but certainly more than three-fourths of the disorders of fashionable life arose from the drug of which he was speaking.

Finally, Dr. Clark dwelt upon the heredity of alcoholic taint, and closed by saying that sometimes when he thought of all this 'conglomeration of evils, he was disposed to rush to the opposite extreme, to give up his profession, to give up everything, and to enter upon a holy crusade, preaching to all men everywhere to beware of this enemy of their race.

A COURSE OF LECTURES
ON
THE LAWS OF INHERITANCE
IN RELATION TO DISEASE.

*Delivered at the Royal College of Surgeons of England,
June, 1881.*

By PROF. JONATHAN HUTCHINSON, F.R.C.S.,
Senior Surgeon to the London Hospital; President of the
Pathological Society of London, &c.

LECTURE IV.

Retinitis pigmentosa is a disease of peculiar interest to the student of heredity. It is associated with so many characters which give it importance, that the attention of physicians is pre-eminently attracted to it. It is to be found in patients apparently perfectly healthy, and the lecturer instanced one case which came under his observation at Moorfields: It was that of a young man, who, having seen the progress made by the defect in other cases, and recognising the same symptoms in himself at their outset, described himself as "going blind," and then, in despair, added his conviction that no cure of his condition was possible. These mournful cases can be certainly diagnosed by the aid of the ophthalmoscope; but even before this instrument was invented the clinical features of the disease had been thoroughly well recognised, and Dr. Adams in his work instanced several examples of its hereditary transmission.

Retinitis pigmentosa rarely appears at birth, although we are amply justified in assuming that the tendency to it is present at this stage of existence. It commences at a very early age, however, and gradually assumes serious proportions. The actual oncoming of total blindness may be deferred for as long as forty or fifty years, in this respect presenting a marked contrast to deaf-mutism, which, as we have seen, speedily develops its worst powers. The two diseases are in many ways related, and may co-exist in the same individual.

Dr. Adams mentions the case of a family of which the members were wont to be afflicted with deafness, but in those who were left sound to the age of sixteen or eighteen, the defect failed to make an appearance. In *retinitis pigmentosa* the choroidal structure is interrupted, and the retina is gradually obscured by a dense pigmentary deposit; the vessels of the organ shrink up, and when once the series of events becomes established, it pursues a certain and inevitable course to the end. We may entertain the sure conviction, moreover, that each patient thus affected is related to others similarly afflicted, and that the laws relating to it are precisely those which apply to other inherited diseases. It is very common among Jews, Liebreich having proved this conclusively as a result of his observations among the inhabitants at Berlin. His researches, conducted with the assistance rendered by the ophthalmoscope, all tended to confirm the conclusions deduced from clinical investigations, and especially that *retinitis pigmentosa* and deaf-mutism observe a close relationship. In Berlin the number of deaf mutes among Catholics, who prohibit consanguineous marriages, amounted to 1 in 3,000, while the proportions were 1 in 2,000 among Protestants, with whom such marriages were not forbidden; and among the Jews, who encourage intermarriage with

blood relations, the numbers rose to 1 in 400. And further, Liebreich discovered that deaf mutes were mostly found in families containing other members affected in the same direction. From the tenacity with which *retinitis pigmentosa* clings to those families in which it has once established itself, it would seem to be intensified by consanguineous marriages; but before this is definitely accepted to be its predisposing cause, inquiries should be made into the family history of affected persons. As the result of such inquiry in 23 cases of the disease, Mr. Hutchinson found that eight could produce no evidence of previous taint; ten presented history neither of the disease nor of consanguineous marriage. In two cases there was good evidence afforded that no tendency to the disease had exhibited itself during three generations, but one instance, that of a quaker family, gave proof of an opposite character. In this there had been intermarriage between two first cousins, and the descendants of these are at present the subjects of advancing *retinitis pigmentosa*. Other examples from the records of the Moorfields Hospital could be adduced to show the effects of consanguinity in forwarding the development of the disease; and considering the doubtful character of the evidence at any time attainable from the accounts given by patients, and the difficulty of gathering accurate information concerning the antecedents of families in which the disease occurs, together with the direct evidence of inherited tendency which from time to time occurs, the conclusion is justified that consanguineous marriages favour the production not only of *retinitis pigmentosa*, but also of deaf mutism.

In spite of its apparent pathological isolation, *retinitis pigmentosa* is allied to certain forms of choroiditis, and to disease of the optic nerve, the character to be relied on being early occurrence in families which exhibit a tendency to other forms of inherited disease. The history of such tendency may be difficult, or even impossible, to make out, or there may be a well-marked tendency present in the family to other derangements of the optical structure, such cases being by no means rare. One such is related of a lady, who, always myopic, had a sister, father, aunt, and uncle, all of whom suffered from some affection of the eye. In another of Mr. Hutchinson's cases, two sisters who were under his care in 1875, were subjects of an affection of the eyeball when eight months old, and in them the ophthalmoscope showed a choroidal affection, which, however, did not extend so far as to set up *retinitis pigmentosa*. In these cases there was no history obtainable of inheritance or of consanguineous marriage, and the children of the patients were free from disease. In another case brought to his notice ten years ago, that of a child, Mr. Hutchinson discovered several exceptionally interesting features in the eye of the patient. There was a deposit of pigment, stellate in form, with extensive atrophy of the choroid, this being usually absent in regular *retinitis pigmentosa*; and there were other peculiarities present in this organ. The mother said that of eight living children four were similarly affected. Paraplegia had occurred in childhood, the sexual development had been arrested, and in three male children mammae had definitely grown. In 1870 a letter carrier brought his child to the hospital for treatment, which was suffering from blindness; and five years after he brought a second child afflicted in the same way. These children were members of a family of ten, of whom five were either blind at birth, or became so soon afterwards, while the remaining five had good sight. There was no obvious cause for the occurrence, the family history revealing an account neither of inherited defect nor of consanguineous marriage. Cases of a similar nature have frequently been recorded in which the history of the affection in former generations is entirely wanting, and in which, too, there is no record of consanguineous marriages to explain the tendency. Sometimes, though but rarely, we meet with the fact of consins marrying to account for it; and when this is so, it usually happens that more than one individual of the family suffers.

Deaf-mutism may be transmitted by either parent to

either sex. Though frequently termed congenital, it usually is developed some time after birth, and the assumption that for this reason it is not really a congenital disease has given rise to the belief that intermarriage among deaf-mutes need not necessarily be prohibited. The existence of the condition is commonly noticed in Ireland, in which country both intermarriages and consanguineous marriages meet with more or less encouragement—a fact to which we are entitled to look for explanation of the frequency observed. Where once established in a family, the defect is transmitted without necessarily being attended by any reduction of the other faculties; but where it occurs *de novo* it is most often attended with feeble intellectual development, and a dulling of the special senses. It is, notwithstanding all that has been said, however, surprising to how small an extent the transmission of deaf-mutism takes place in the case of those intermarriages among deaf-mutes, which are, in great part a result of the association of numbers of congenitally-afflicted persons of this class in the training institutions devoted to their rearing and education. The facts appear in the light of an exception to the known laws of heredity, and demonstrate a tendency to atavism, the full meaning of which we do not as yet exactly appreciate. A careful examination of the data at our disposal, however, may serve to remove some of the exceptional divergences which appear. Dr. Adams quotes instances of perfectly-endowed children, the offspring of deaf-and-dumb parents; and American statistics show that only ten per cent. of children of deaf-mutes preserve their parents' defects. According to other tables the proportion is given as one to three, while the experiments of Mr. Elliott, whose large opportunities of forming a conclusion on the point, derived from a lengthened residence as master of a large deaf-and-dumb training institution, gives his opinion great weight, declares that the numbers vary within wide limits; he also describes intermarriages as very common among deaf-mutes. The Irish Commissioners report that the number of children born from deaf-and-dumb parents is small; and on all hands the different accounts presented on the subject make it an extremely difficult matter to determine the exact relation borne by the parents to their offspring in this particular. The facts, at their best, indeed, only prove that it is a difficult matter to transmit peculiarities of this description, a fact but for which the number of those born thus seriously afflicted must be largely excessive. It should be added that the statistics relating to Ireland are not borne out by those collected from other sources; and Mr. Hutchinson concludes, after a careful review of all the evidence bearing on deaf-mutism, that the defect is undoubtedly transmissible; and although it is well to keep fairly in mind all that has been adduced to prove the infrequent occurrence of such transmission, it is advisable to recollect also that the assertion of a latent power will always be attended, after a period of inactivity, with increased development of the hidden tendency, as numerous well-authenticated cases sufficiently testify.

The diseases illustrated in this and the preceding lectures possess a high importance from the demonstrations they afford of the pathological bearings of the subject under treatment. They are probably but the most prominent instances of inherited maladies, and we may anticipate that the truths discovered concerning them will by-and-by be equally applicable to other forms of disease in the future. We cannot doubt that, while intra-uterine changes bring about such conditions—of the eye, for instance—as are observable at birth, other organs, as the heart, veins, &c., may be, possibly in some slight degree only, influenced by the action of similar sets of conditions. Thus, surely, might we offer an explanation of the apparently inscrutable constitutional differences affecting various persons, whereby one is poisoned by the smallest dose of a drug (*e.g.*, iodide of potassium) which, on another, reacts beneficially; or whereby usually-nutritive foods like honey, eggs, &c., are impossible to be taken through some peculiarity of individual structure.

Defects without number may be set up during life *in utero*, and, once established, be transmitted from generation to generation unfailingly. Moreover, the type of defect once established, it may intercross with others, to the production of mongrel diseases. These set up complications without number, and bring about the possibility of the inheritance at once of the original constitutional defect, and of all those hybrid diseases induced by the chance meeting between it, and such other maladies as it has met during the term of its perpetuation.

The exciting causes of hereditary malformations and diseases are numerous and complicated. Among them may be enumerated unsuitable marriages, former occurrence of diseases, and neglect or over-excitement of functions. Functional changes once duly fixed by pathological changes, are transmitted from individual to individual, and that which at the outset ranks only as an idiosyncrasy may by-and-by develop into a determinate disease. An instance of this is afforded by a form of amaurosis due to excessive tobacco smoking, the tobacco here acting not as the actual producing cause of the disease, but as an excitant of the tendency to defect when once originated.

Diathesis is a convenient term which, when qualified by such adjectives as "catarrhal," "bilious," &c., serves to indicate a tendency to the development of certain definite conditions under appropriate fixed circumstances. Diathesis is a habit of body wholly distinct from actual disease, the appreciation of which is of the highest importance to the physician. It is a peculiar feature discernible in family transmission, and is worthy of most attentive study. The tendency to chilblains runs in families, and is transmissible, but the tissues, after youth is past, seem less sensitive to the changes induced in them. Struma is affiliated with this condition, and, rightly understood it has no direct relation to the tubercular diathesis. In the same way lupus is, in its origin, allied with chilblains, for all its after-course is so entirely different. In these forms of disease the tendency is determined by a constitutional peculiarity—a tissue tendency which is, in effect, the diathesis, and the nature of which is determined by the conditions of inheritance and transmissibility.

PROPHYLAXIS OF RABIES AND HYDROPHOBIA. (a)

By THOMAS M. DOLAN, F.R.C.S. Ed.,
Halifax, Yorkshire.

MR. PRESIDENT, VICE-PRESIDENTS, AND GENTLEMEN,—From the year 1870 to 1877 395 deaths were registered from hydrophobia in England and Wales. This represents a large sacrifice of life from what should be a preventable disease, so that I may well be excused for harping on a favourite string, and introducing to your consideration some new thoughts on rabies and hydrophobia.

If we look at the annexed table we shall see how these deaths have been distributed, and through the courtesy of the Registrar-General of England I have been enabled to draw it up.

We may readily draw some conclusions from the following table, and one of the most striking is the high death-rate in the north-western and York divisions, and we must naturally ask the cause leading to this excessive mortality in the districts embraced by these columns.

Hydrophobia depends upon rabies in the dog. Rabies has been extremely prevalent during the years 1870 to 1877 in Lancashire and Yorkshire, and when we remember the densely-populated towns, with dog-loving inhabitants in these counties, their geographical position, we need not wonder that if rabies once obtained a footing in this part of England, it should spread over the whole island. It has spread east and west, north and south;

NOTE.—The causes of death for 1878 are not abstracted.

and as a result we have the large number of deaths from hydrophobia shown in the table I submit to you.

I think it self-evident that there is a necessity for more severe and stringent precautions in reference to dogs. Can rabies be stamped out? or, if that is impossible, can it be limited or checked? These are the questions we have to consider. I think we can give a positive and decided answer to the second one. The answer to the first question depends on the reply we can give to two points.

1st. The incubative period of rabies.

2nd. The spontaneous origin of rabies.

It would be easy to frame a general code for the stamping out of rabies if the malady had a definite period of incubation, or if its spontaneous origin could possibly be denied.

Now, what do we know of incubation? what of the *de novo* question? for upon these two points the framing of a stamping-out code depends.

1st. Incubation in the dog. Upon this point I must content myself with the opinions of two of the best authorities in Europe on rabies, viz., Bouley and Fleming. Bouley tells us (article, "Rage," p. 162, "Dict. Ency. des Sciences Medicales") that the duration of the incubation of rabies in the large ruminants, varies from twenty to sixty or seventy days, and that forty days may be considered as the average. In twenty cases collected by himself, the period of incubation was found to be as follows:—

From 20 to 25 days	4
" 25 " 30 "	2
" 30 " 40 "	7
" 40 " 50 "	5
" 50 " 60 "	2

Haubner, from statistics of 234 cases, established the period of incubation in the bovine race in the following ratios:—Three months, ten per cent.; four months, eight per cent.; and for the surplus an incubation of nine months. Yet this limit, according to Haubner, might be extended, for he cites cases where the duration of incubation has been a year and two months, and two years and six months.

Fleming, in his work on "Rabies and Hydrophobia," thus sums up his data:—"From these statistics and facts it will be seen that nothing can be said with certainty, or in a positive manner, as to the length of the interval which elapses between the receipt of the injury and the appearance of rabies, and that it is therefore hazardous to say, when a dog has been wounded by one that is rabid, at what period it may be considered safe from an attack of the disease, as there are no reliable limits to this latent period. Young dogs are sooner affected than old ones."

Considering, then, that it is impossible to fix definitely the period of incubation, we have the first difficulty in the way, for the quarantine necessary would have to be of indefinite length.

2nd. Spontaneous origin of rabies.

Bouley and Fleming both have pronounced their opinions on this subject. At page 92, of the article previously quoted from, Bouley says:—

"Contagion alone is proved. Contagion then is the certain and probably the only cause of rabies, whatever disagreement there may be on this point, there is unanimity in regarding it as the preponderating cause. It is contagion we have to keep in view, in prescribing sanitary measures against this formidable malady, for if it were possible, as Professor Saint Cyr truly tells us, to destroy on the same day, and on the same hour, all dogs affected with rabies, in the patent or latent stage, there would be a great chance of stamping out, by the same blow and for ever, rabies."

Fleming, on the other hand, thus expresses himself:—"Taking into consideration the history of the disease, and the circumstance so frequently attending its advent and progress, we are constrained to agree with those

veterinarians who maintain that it is spontaneously developed."

We have here difficulty the second, so that we cannot safely say it can be stamped out. We must then have recourse to a possible plan of checking or limiting it, which, I hope to prove, will be almost tantamount in its results to a stamping out process.

(To be concluded.)

ON TYPES OF IMBECILITY. (a)

By FLETCHER BEACH, M.B., M.R.C.P.,
Medical Superintendent of the Darenth Asylum.

THE author referred to the different systems of classification of cases of imbecility (b) which have been adopted, mentioning particularly that of Esquirol, whose system is based upon the power of speech possessed, and that of Bucknill and Tuke, who classify cases according to the degree in which the reflex and volitional functions are manifested. He then brought forward one which is based upon certain characteristics found to exist in those cases under his care, a classification which he had found useful in demonstrating the disease to students and others. Under this system cases are classified under the headings of Congenital and Acquired Imbecility, including under the former those occurring at the time, under the latter those supervening after birth. The following is the classification which he has adopted.

IMBECILITY.

- | Congenital. | Acquired. |
|------------------------|------------------|
| 1. Simple congenital | 1. Eclampsic |
| 2. Microcephalic | 2. Epileptic |
| 3. Hydrocephalic | 3. Hydrocephalic |
| 4. Scaphocephalic | 4. Paralytic |
| 5. Paralytic | 5. Inflammatory |
| 6. Cretinism | a. Hypertrophic |
| (sporadic and endemic) | 6. Traumatic |
| | 7. Cretinism. |
| | (endemic) |

The points to be observed in diagnosing imbecility in infancy and in childhood were then given, and cases illustrating the different types related.

It was shown that, under the heading Simple Congenital Imbecility, cases of a very low and others of a fairly high type were included, and reference was made to the vaulted palate which is often found in patients when the imbecility is congenital. The supposed cause of microcephalic imbecility was alluded to. It was formerly held that this was due to the sutures of the skull closing in prematurely, and so hindering the growth of the brain, but in contradistinction to this is the fact that, many microcephalic imbeciles have been found with open sutures. In those cases where the sutures have closed in before birth, the question still remains, whether the brain ceased to grow because the sutures were closed, or whether the sutures closed in because the brain ceased to grow, or whether the brain and its coverings ceased to grow from a common cause. Cases of hydrocephalic imbecility where the head was hydrocephalic at the time of birth, were considered and the difference between the hydrocephalic and rickety head was pointed out. Scaphocephalic imbecility includes cases who have a keel-shaped head, but whether this is produced by difficult labour or not, the author was unable to ascertain. Paralytic imbeciles were shown to make good progress mentally, and but little physically, and an interesting case was related of a boy who was born with paralysis of the right side, the mother when pregnant having fallen with great violence, striking her side against

a wall and becoming insensible. In that patient there was flattening of the side of the cranium opposite to the paralysis. The characteristics of sporadic cretinism were mentioned, the broad face, pug nose, thick lips, full and flabby cheeks, short arms and legs, and large hands and feet found in such cases being especially pointed out. The chief difference between sporadic and endemic cretinism was shown to be, in the former, usually the absence of a thyroid gland and generally fatty tumours in the posterior triangles of the neck.

More improvement was stated to take place in cases of acquired than in those of congenital imbecility, and the reason for this was explained. Congenital imbeciles are born with brains deficient in quality as well as often in quantity. Whether training does or does not increase the number of cells is a moot point; but if it simply improves the quality of those present, although improvement may occur, the author could not see that recovery could be expected to take place. In acquired imbecility we have a brain which, though often highly sensitive and easily upset by slight causes, is, no doubt, of normal structure at first, and in course of time in many cases regains its normal condition, in the same way as does the brain of a lunatic. Exception must, of course, be made to those patients who are subject to frequent and repeated fits and in whom treatment has no effect. Eclampsic imbecility was shown to be due to convulsions coming on soon after birth, continuing some years, and then ceasing, but leaving the structure of the brain so altered that the child becomes imbecile. In most of the cases which had come under the author's notice there had been intemperance, or a history of insanity, apoplexy, or epilepsy in the parents, and the child had been handicapped as it were in the race of life and had less chance of recovery from the fits without loss of intellect. Under the heading Epileptic Imbecility, are included some cases where with cessation of fits the greatest improvement takes place, and others who go on from bad to worse, and finally end in utter dementia. A case of acquired hydrocephalic imbecility was related, and then acquired paralytic imbecility was entered upon. Under this class were included patients who had become so after birth, either from repeated fits, infantile paralysis, cerebral apoplexy, or atrophy of the brain. In these cases, as in those born paralysed, there is mental improvement under training, if the patient is not subject to fits, but the paralysed limbs make little progress towards recovery. Mention was made of the fact that Schroeder van der Kolk had collected several cases where there was found shortening and atrophy of the limbs and atrophy of the opposite side of the brain. One such patient had been seen by the author. In the majority of cases of this kind more or less imbecility existed, although this was not always the case. Schroeder van der Kolk says, "Everything, in my opinion, depends upon the more or less healthy state of one hemisphere of the brain. If, as from the nature of the case, seldom occurs, the inflammation and affection of the pia mater has not extended to this hemisphere, if the grey matter under the cerebral convolutions has here continued perfectly sound, there is no reason why the remaining hemisphere should not be able to act without impediment in the exercise of those functions which are necessary to our mental powers, just as one eye sees as sharply though the other be lost. But when the grey matter is injured in both hemispheres, particularly anteriorly, disturbance of the intellectual faculties will be inevitable." Inflammatory imbecility was said to be due to measles, typhoid fever, and other acute diseases, as a result or complication of which inflammation of the brain or membranes was produced, not sufficiently grave to be fatal, but serious enough to cause mental impairment. "The amount of damage done to the intellectual forces," as Dr. Ireland says, "must be mainly dependent upon the intensity of the morbid process." This, unfortunately, we have seldom a direct opportunity of measuring as the patient does not come to us till long after the disease has passed away. If one of the diseases above mentioned

(a) Abstract of a paper read before the Harveian Society.

(b) The word imbecility is used in preference to that of idocy, to avoid the confusion which the use of the two terms has been found to produce when describing cases to those unacquainted with the subject, and it includes all patients whether of low or high type. For further particulars, see *Lancet*, November 30th, 1878.

occur in a child previously disposed to imbecility by being born of parents whose family history shows the existence of marked neuroses, there would be the greater liability of imbecility following. The reason for placing hypertrophic imbecility in this class was shown to be because the post-mortem appearances of the patients who had died of this disease in the Darent Asylum show that there is, or has been, chronic inflammation of the brain. The difference between hypertrophy of the brain and chronic hydrocephalus was then pointed out. Traumatic imbecility includes cases where from a fall or blow on the head the patient has become imbecile. Under this heading would also come cases so produced from injuries to the head produced by narrowness of the pelvis and prolonged labour. The degree and nature of imbecility so produced must vary with the amount of the destruction of nervous tissue. Sometimes the injury to the mental power is permanent, sometimes it disappears more or less slowly; in some cases a trifling injury causes grave disorder, in others what appears to be a great injury leaves no visible effects behind. Hereditary predisposition has, no doubt, much to do with this. Endemic cretinism was alluded to, and the description of the three classes into which these cases were divided by a Commission appointed by the Sardinian Government was given.

Clinical Records.

MEATH HOSPITAL AND CO. DUBLIN INFIRMARY.

BRIEF NOTES OF OPERATIONS

Under the care of LAMBERT H. ORMSBY, F.R.C.S.,
Lecturer on Clinical and Operative Surgery.

(For these Notes we are indebted to Mr. PERCY NEWELL.)

OPERATION I.—*Case of Venous Nævus on Face Treated by Ligature.*—Kate P., a baby, *æt.* 4 months, admitted to Meath Hospital, June 12th, 1880, suffering from a large venous nævus, about the size of a shilling piece, situated on the temple at the left outer margin of eye. *History.*—The mother states she did not notice it until three weeks after the child was born, and that it has been gradually increasing in size ever since. The skin and cellular tissue were implicated, and on firm pressure being applied with the fingers, the blood could be pressed out of it, thus considerably diminishing the size of the tumour. Treatment adopted was strangulation of the tumour by means of a hempen ligature. Operation performed June 13th. The tumour was compressed firmly by the fingers of the operator until it became very pale, and considerably smaller in size; two needles were then passed at right angles through the base of the tumour, and a stout ligature was then placed round the tumour behind the needles, and tightly tied. In ten days the tumour dropped off, leaving very little mark.

OPERATION II.—*For Large Diffused Ganglion in Palm of Hand.*—Mary Anne R., *æt.* 22, servant, admitted to Meath Hospital, 15th May, 1881, with large diffused ganglion, involving the sheath of the flexor tendon of second finger, extending into palm of hand. *History.*—States that she hurt her finger severely three years ago, and that the swelling remained there ever since; it was very painful, and signs of fluctuation of the fluid enclosed in the ganglion were quite apparent. On admission the treatment adopted was, pressure by means of a splint cut to the shape of the fingers, and well padded and bandaged to the forearm; but the swelling in no way decreased in size. Operation performed on June 15th, the patient being placed under the influence of ether. Mr. Ormsby made a free incision into the tumour, and let out a quantity of fluid having the consistence and colour of synovial fluid. Smart hæmorrhage

followed, which was arrested by pressure. The hand was then placed on a splint and carefully bandaged, and since the operation the treatment has been progressing favourably, no inflammation of the flexor tendon, nor suppuration of the forearm, followed the incision.

OPERATION III.—*For a Case of Perforation of the Prepuce due to Neglected Phymosis, complicated with Chancres.*—John S., *æt.* 64, admitted to Meath Hospital, 15th June, with perforation of prepuce, due to ulceration and neglect of soft chancres on the glans penis beneath the prepuce. On admission the prepuce was found to be in a state of slough. The glans had made its way through the upper part of the prepuce, and a portion of it was only attached to the penis by a small piece of healthy tissue. Operation performed on 15th June, 1881. The prepuce was then eventually removed all round the organ, and the skin and mucous membrane carefully drawn together by sutures. All hæmorrhage was arrested, and black wash was then applied to the chancres brought into view by removal of the sloughing prepuce. This completed the operation.

OPERATION IV.—*Circumcision for Congenital Phymosis.*—J., *æt.* 16, was admitted to Meath Hospital on June 15th, 1881, suffering from congenital phymosis of a very aggravated character. The prepuce was contracted in front of the glans penis and the preputial orifice was so tight and small as to admit with very great difficulty a No. 1 catheter. The boy had never had gonorrhœa, but found a difficulty to expel the urine rapidly during micturition. Besides, the pent up preputial secretion at times produced a great deal of irritation. Operation performed on him: the patient was placed under ether, and the prepuce was well drawn forwards by a forceps. Two needles, armed with ligatures, were then passed through the prepuce behind the forceps, which were held obliquely, looking downwards and forwards. After the needles were passed, the elongated prepuce was divided in front of the forceps with one sweep of the knife. The forceps was then removed, but it was found that the prepuce was to a great extent permanently adherent to the glans, which complicated the operation somewhat, and gave the operator considerable trouble to separate its attachments evenly round, which, however, was done, and the orifice of the urethra and glans were then brought into view. The skin and mucous membrane were then brought together by sutures, and strips of wet lint applied, all bleeding being arrested. The boy made a very good and rapid recovery.

CHAPTER II.

Accidents following Paracentesis Thoracis.

(Continued.)

RECENTLY, the method of operation by aspiration has been held guilty. It is pretended that aspiration is too powerful, and it lowers pleural tension; and that, by the use of such means, the fluid is voided too precipitately. I need not seek far to show how little foundation there exists for these accusations. I have only to consult the records of cases, and I find conclusively that in sixteen cases of albuminous expectoration, in which the method of operating is given (thesis of Dr. Terrillon), the operation was done twelve times with a trocar without aspiration, and only four times by aspiration; and in six fatal cases, which I

have already mentioned, the operation was done three times with a trocar and three times by operation. These figures are the best advocate in favour of aspiration, since the most numerous accidents have occurred without it, they appeal more loudly than theories relating exclusively to differences of tension, and compel us to seek the cause of the accidents elsewhere than in the operation. (I do not refer to the manipulation, but to the operation itself.)

But if these accidents have nothing to do with the operation, to what are they due? If we in the first place analyse the six cases in which the operation was followed by death, we find that five of them were cases of complicated pleurisy. In the first (Gombault) the opposite lung was partially fibrous, shrunken, and bound down on all sides by adhesions, the result of old inflammation. In the second (Girard), the patient was affected with acute rheumatism and double pleurisy. In the third (Béhier), there was besides the left pleurisy, tubercular broncho-pneumonia on the right side. In the fourth (Dumontpallier), the patient had, besides right pleurisy, bronchitis and adhesion of the left lung. In the fifth (Bouveret), the patient who was cyanotic and in a state of asphyxia, had old tubercular pleurisy with adhesions, and between six and seven pints of fluid. If I now examine the less formidable accidents of pulmonary œdema and albuminous expectoration, followed by cure (thesis of Terrillon), I still perceive that most of these cases occur in complicated pleurisy. Thus, in cases Nos. 13 and 17 (Lassègue) the patients had also disease of heart, aortic lesions, mitral disease, œdema of the lower extremities, &c. In Case 3 (Buquoy) I find cardiac hypertrophy, with aortic and mitral murmurs. In No. 15 (Lancereaux) it is said that the patient, who was very chlorotic, was in the fourth month of pregnancy, and subject to chronic bronchitis and night sweats. In Case 7 (Marotte) the patient was also affected with pulmonary tubercle. And as regards accidents following paracentesis, when the pleurisy was uncomplicated, I notice that these mishaps always coincide with the *immediate issue of a large quantity of fluid*—9½ pints (Marotte) Case 7; in Fausillon's case, No. 18, 5 pints; and in observation No. 9 (Moutard-Martin) 5 pints, and in other cases 3½ pints.

Thus it will be seen that the slight, grave, or fatal cases of pulmonary œdema and albuminous expectoration after paracentesis have been invariably associated either with the complications of pleurisy (heart disease, bronchitis, tubercle, numerous and old adhesions, double pleurisy), or with the immediate issue of a large quantity of fluid, but more frequently with these two causes combined. But apart from these conditions I look in vain for accidents in the cases of simple pleurisy, and I seek them in vain in the thousands of cases in which the amount of fluid withdrawn at one time from the chest has not exceeded 1½ or 2 pints; they do not exist. I demand of my confreres if it is not so? When they have to treat a case of simple pleurisy, and, *above all*, when the amount of fluid withdrawn has not exceeded 1½ or 2 pints, have they ever observed the slightest hitch in the operation? For myself, I declare that in the 150 cases of paracentesis by aspiration which I have performed, or had carried out in my presence, I have never noticed the slightest complication, and have never seen the shadow of an accident. However, I err slightly in saying "never," for once this happened. At the hospital—La Pitié—in the service of Dr. Gallard, for whom I was acting, with Mr. Darolles as intern, I took in a healthy young man with acute pleurisy, there being considerable effusion. The symptoms being urgent, I performed paracentesis by aspiration, and, as is my usual practice, I stopped the flow of the fluid at a pint-and-a-half; two days afterwards I withdrew another pint-and-a-half. The patient considered that he was already cured, and begged "that they would finish emptying." In another two days I, therefore, had a final aspiration performed by one of the pupils, but instead of arresting the flow at a pint-and-a-half, I yielded to the request of the patient, withdrawing 2½ pints of fluid. In half-an-hour after the operation this young man was seized with pulmonary congestion, with fits of coughing; and he threw up three ounces of albuminous expectoration. Fortunately, the matter ended there; he soon began to improve, and cure followed rapidly. Now, in this case, if the issue of 2½ pints sufficed to cause this slight accident in this patient, when on two occasions the withdrawal of 1½ pints had been absolutely safe, what would have happened, I ask, if at one operation I had removed the whole 5½ pints?

It is certain that lamentable consequences would have resulted; and for once I regretted having somewhat broken the rule I had myself imposed. It was a good lesson, and I shall not forget it.

I, therefore, have the conviction, based for the one part on the more or less unfortunate cases which I have detailed, and on the other part on the 150 cases which are the result of my own personal observation, that the pulmonary congestion, acute œdema, and albuminous expectoration may always be avoided. The particular operation chosen matters little; the essential point is never to withdraw more than 1½ pints of fluid at a time. The rule should be to empty considerable effusions at repeated intervals, the rule becoming still more strict in dealing with old or complicated pleurisies.

In fact, to withdraw at one time 3 or 4 pints of fluid is to suddenly remove from the lung that which for several weeks has compressed it, and rendered it bloodless. The blood returns precipitately into the vessels, the air into the alveoli; and the violent congestion which thus results may cause the accidents which I have just described.

In certain cases, the lung on the sound side shares in this congestion, and may even be the principal cause of the symptoms (Bouveret). The reason is that the effusion when considerable does not only compress the lung on the side affected, but it masses together the mediastinal organs and the pulmonary vessels; the sudden resumption of the pulmonary circulation, if the effusion be too rapidly or too completely emptied, becoming a cause of danger. On the other hand, in limiting to 1½ pints as a maximum, and to a smaller quantity in special cases, the quantity of fluid withdrawn at one time, the lung returns gradually to the functions which have been in abeyance, is not taken by surprise by the pulmonary circulation suddenly set at liberty; and respiration, as well as aëration, are re-established without shock.

The No. 2 aspiratory needle is so innocent, its management is so simple, the puncture it makes being so little painful, that a patient ought certainly not to be exposed to the drawbacks which I have just enumerated, when the operation may be repeated in one or two days without any trouble, making two or three punctures instead of one.

For the rest all details will be fully considered under the head of "Method of Operating" (Chap. 4).

Apollinaris (continued).

APOLLINARIS WATER, although comparatively new, is one of the best known and is extensively used in this country, owing to the mode in which it has been advertised, and also to undoubted merits of its own.

It flows, according to the statement of the proprietors, from a spring in the valley of Ahr, near Neuenahr, in Germany. It has been stated from personal inspection that from the well issues a supply of mineral water amounting to 6,000 large bottles per hour, equal to 40 millions per annum. None other than the natural gas

is said to be used in charging the bottles and jars. In this respect the Apollinaris Brunnen was one of the first natural aerated springs put upon the market. It springs according to the circulars from a deep, rocky source. Again the directors say, "Apollinaris being a *pure natural product* possesses many obvious advantages as a table beverage over ordinary artificial aerated waters." We must demur to such a theory, because there are hundreds of mineral and other *pure natural* waters which are perfectly unfit for table use.

There seems to be two qualities of Apollinaris water in the market—1st. Bottled under single pressure. 2nd. Bottled under double pressure. We presume this first water is bottled under the pressure obtainable at the surface.

In speaking of the amount of carbonic acid present in this water, and the peculiar mode in which the above-quoted aëration is expressed, we must dwell for a moment upon the subject of the genuineness of the Apollinaris water, as it very materially concerns a series of articles like the present, which have been constructed with a view of determining the merits of, and *bona-fides* of, such preparations. It is no secret that the genuineness of Apollinaris water has been disputed. In other words, it has been stated that Apollinaris is a made-up water—being in fact not only artificially aerated, but more or less added to as regards its constituents. If so, it would be our bounden duty to expose such an imposition; whilst, if it is not so, we have every right to try and to clear away any mystery. We are of opinion that the expressions quoted have led to a misapprehension as regards this point. We refer to "bottled under single and double pressure."

The amount of carbonic acid stated in the analyses (see original analyses) corresponds to the amount of free and combined carbonic acid as found at the mouth of the spring—*i.e.*, on the surface of the water. The water, while in the depth of the earth, contains a larger quantity of carbonic acid corresponding according to a well-known scientific rule to the height of the column of water pressing upon it.

The slight difference in favour of the carbonic acid of the water in glass bottles as compared with that in stone jugs is owing to the fact that the transparent bottle can be filled with water up to the necessary height, and immediately corked without the admission of any air. While a wooden plug has for a moment to be inserted into the stone jug, in order to expel a sufficient quantity of water to allow the jug to be corked without bursting. We have steadily set our faces against the use of stone-ware jars for mineral waters, believing that the undoubted superiority of glass in every respect, both as regards the keeping of the water, its freedom from earthy impurities, and other causes, too numerous to now recapitulate, are quite sufficient to do away with this relic of barbarism. The great inducement (*i.e.*, the dearness of glass) is now gone. It is,

therefore, with some surprise that we see a large and important company encouraging such a mistake as to cater for the old-fashioned prejudices of the ignorant.

As regards the genuineness of the Apollinaris water there can be little doubt. The natural carbonic acid gas, being used for charging the bottles, and producing a water which, when bottled, exerts a considerable pressure, is one of the two reasons which have given rise to the statement: The water seems to be obtained at a depth of 70 feet below the surface of the earth, and calculating from the quantity of free carbonic acid gas in the water at the outflow of the spring, it follows in accordance with the physical laws, that the water when drawn must be as much supersaturated with carbonic acid as if subjected to a pressure of more than two additional atmospheres. Considering that the spring at its outflow has a temperature of 17° R., its origin on the basis of the so-called Henry's principle must be supposed to exist at a depth of 920 feet. Here it would have 29 times the quantity of carbonic acid gas that the water shows at its outflows.

These remarks will explain the fact of enormous exhalations of carbonic acid at the spring, which are so great that in the absence of strong winds it is found impossible to descend the stairs leading to the pit surrounding the spring, further than within eight to nine feet above the pavement. When the water rises to the surface the gas escapes from the water; but as the spring is covered by a metal cylinder, the gas is carried into a hermetically closed reservoir, from whence it is forced again into the water, under such pressure as will represent the pressure exerted at the depth from whence the water is taken. If this is a correct explanation, we consider such a procedure not only eminently scientific but perfectly legitimate, and thus disposes of the statement of its being similar to an artificially aerated water.

The good reason for the statement that Apollinaris water is artificial is the small addition of chloride of sodium—which is openly acknowledged. This is the statement put forward by the company:—"A small quantity of chloride of sodium (never exceeding 1 in 1,000 parts) is added to the water, or the corks are soaked in a solution of salt. It had been noticed that when mineral waters had been bottled for a length of time, sulphuretted hydrogen was developed, owing to the reducing action of the cork on the small amount of sulphate of soda contained in such waters. As a preventive, Professor G. Bischof's proposal to make the aforesaid addition was acted upon. The change made by the addition in the composition is so trivial, that attacks based upon it are not worthy of serious consideration.

(To be continued.)

M. PASTEUR, who has a prospect of winning one of the three vacant seats in the French Academy, will receive it is believed, the Grand Cross of the Legion of Honour in the promotions which will accompany the 14th of July National Fete.

THE INTERNATIONAL MEDICAL CONGRESS.

The following is the programme of the arrangements for the International Medical Congress, to be held in London next month.

General Arrangements.—An informal reception will take place at the College of Physicians, on August 2nd, from 3 p.m. to 6 p.m., at which the Executive and Reception Committees will meet the members of the Congress. The opening meeting of the Congress will be held in St. James's Hall, on August 3rd, at 11 a.m. The other general meetings will be held in the University of London.

The offices of the Reception Committee are in the College of Physicians, north-west corner of Trafalgar Square. The office of the Reception Committee at the College of Physicians will be open for the Registration of members on and after Monday, July 18. Members are requested to call as soon as possible after their arrival in London. Every possible information will be given as to the prices and situation of convenient hotels and lodgings.

Members wishing to take part in any excursions, or to visit any of the private and public places of interest open on the occasion, must enter their names in the proper book, at the College of Physicians, at the earliest opportunity, in order that the necessary arrangements may be made.

Members of the Congress are admitted free, on presentation of their tickets of membership, to view the International Medical and Sanitary Exhibition at South Kensington, at which will be exhibited the various materials and apparatus employed in the prevention, detection, cure, and alleviation of disease.

The following is the Daily Programme:—

Tuesday, Aug. 2nd. 10 a.m. to 6 p.m.—Registration of members and issue of tickets, Royal College of Physicians, 8 to 6 p.m.—Reception of the members of the Congress by the Executive and Reception Committees at the Royal College of Physicians.

Wednesday, August 3rd. 8 a.m. to 6 p.m. 11 a.m.—First general meeting, St. James's Hall: Address of welcome by the chairman of the Executive Committee; sec.-gen's report; election of officers, election of hon. presidents of the Congress; election of hon. presidents of the Sections; inaugural address by the President of the Congress. 3 p.m.—Meeting of the Sections, Constitution of the Sections; and other business. 9 p.m.—*Conversazione* at South Kensington Museum, given by the English members' of the Congress to the foreign members.

Thursday, August 4th. 10 a.m. to 1 p.m.—Sectional meetings. 1.30 to 3.30 p.m.—Visits to hospitals. 4 to 5.30 p.m.—Second general meeting, theatre of the University of London. 6.30 p.m.—Banquet given to a certain number of the members of the Congress by the Lord Mayor of London at the Mansion House.

Friday, August 5th. 10 a.m. to 1 p.m.—Sectional meetings. 1.30 to 3.30 p.m.—Visits to hospitals. 4 to 5.30 p.m.—Third general meeting of University of London: Address by Dr. Billings, Washington, U.S., on "Our Medical Literature." 9 p.m.—*Conversazione* at the Royal College of Surgeons.

Saturday, August 6th. 10 a.m. to 1 p.m.—Sectional meetings. 4 to 7 p.m.—Reception at Kew Gardens by Sir J. D. Hooker. 4 to 7 p.m. Garden Party by Mr. and Mrs. Spencer Wells, at Golder's Hill, Hampstead. 6.30 p.m.—The United Hospitals Club will entertain a party at dinner at the Star and Garter, Richmond Hill.

Sunday, August 7th. 10 a.m.—A service in Westminster Abbey: sermon by Dean Stanley. 8.15 p.m.—Service in St. Paul's: sermon by Canon Liddon. 2 p.m.—The Royal Botanic Society's Gardens, and the Gardens of the Zoological Society, in the Regent's Park, will be open free to members on this, and on every day of the week, on presentation of their tickets. The Royal Gardens at Kew may be visited on Sunday, from 9 a.m. till sunset; and Hampton Court Palace and Gardens from 2 p.m. till sunset.

Monday, August 8th. 10 a.m. to 1 p.m.—Sectional meetings. 4 to 5.30 p.m.—Fourth general meeting: Address by Professor Volkmann, Halle. 6.30 p.m.—Dinner given to foreign members of the Congress by the Society of Apothecaries. 9 p.m.—*Soirée* in the Albert Hall, and the International Medical and Sanitary Exhibition, South Kensington.

Tuesday, August 9th. 10 a.m. to 1 p.m.—Sectional meetings. 2 p.m. to 3 p.m.—Fifth general meeting, theatre of the University of London. Address by Professor Huxley,

F.R.S., D.C.L., London "The Connection of the Biological Sciences with Medicine". 3 p.m.—Concluding meeting of the Congress.

After the concluding meeting, the members, accompanied by their friends, will proceed to Victoria Station, for High Level Station (London Chatham and Dover Railway), where special trains will be in waiting at four o'clock to convey them to the Crystal Palace. After a visit to the Palace and grounds an informal dinner will take place in the concert room, about seven o'clock. At dusk, the fountains will play during a display of fireworks, which may be viewed by members of the Congress from the Queen's Corridor.

The following places of interest may be visited by members of the Congress, on conditions which can be ascertained at the office of the Reception Committee:—

The Hunterian Museum of the Royal College of Surgeons, Lincoln's Inn Fields, 8 a.m. to 5 p.m. The Library of the Royal College of Surgeons, 10 a.m. to 4 p.m. The Library of the Royal Medical and Chirurgical Society, 53 Berners street, W., 1.30 p.m. to 6 p.m. The Tower of London, 10 a.m. to 4 p.m. The Royal Mint, Tower hill. The Bank of England. The Royal Botanic Society's Gardens, Regent's park, 9 a.m. till sunset. The Gardens of the Zoological Society, Regent's park, 9 a.m. till sunset. The Royal Gardens at Kew, 1 p.m. till sunset. Hampton Court Palace and Gardens, 9 a.m. till sunset. Newgate Prison, Old Bailey. The General Post Office, St. Martin's-le-Grand. The British Museum, Great Russell street, Bloomsbury, W.C., Monday, Wednesday, and Friday, 10 a.m. to 6 p.m.; Saturday, 12 noon to 3 p.m. The National Gallery, Trafalgar square, W.C., 10 a.m. to 6 p.m. The South Kensington Museum, S.W., Monday, Tuesday, and Saturday, 10 a.m. to 10 p.m.; Wednesday, Thursday, Friday, 10 a.m. to 6 p.m. The Soane Museum, Lincoln's Inn Fields, W.C., daily, 11 a.m. to 5 p.m. The Dulwich Gallery, Dulwich, S.E., daily, 10 a.m. to 5 p.m. The Natural History Museum, Cromwell road, South Kensington, S.W., daily, from 10 a.m. to 6 p.m. Stafford House, the residence of the Duke of Sutherland, St. James's, S.W. Apsley House, the residence of the Duke of Wellington, Hyde park corner, W. Bridgewater House, the residence of the Earl of Ellesmere. Hertford House, the residence of Sir Richard Wallace, Manchester square, W. Dudley House, the residence of the Earl of Dudley, Park lane, W. Dorchester house, the residence of R. S. Holford, Esq., Park lane. W. Messrs. Barclay and Perkins' Brewery, Southwark, S.E. Messrs. Maudslay's Works, Westminster bridge road, S.E., daily, 2 p.m. to 5 p.m., except Saturday. Messrs. Penn's Engine Factory, Greenwich, S.E. Messrs. Siemens's Telegraph Construction Works, Woolwich. The Royal Arsenal, Woolwich. The Docks. Buckingham Palace. Windsor Castle. Hampton Court Palace and Gardens. The Houses of Parliament.

Excursions—Friday, August 5th. 12.45 p.m.—Mr. John Penn will receive a certain number of members on board a special steamer at Charing Cross Pier, in order to proceed down the river to Greenwich, and, after luncheon there with Mr. Penn, to visit the engine works of the Messrs. Penn, returning either by water or rail to Charing Cross.

Saturday, August 6th. 2 p.m.—A certain number of members will leave Charing Cross Station by special train, provided free of cost, to witness the unveiling of the Harvey Statue at Folkestone. After the ceremony, the Mayor and Corporation of Folkestone will entertain the visitors at a banquet in the Town Hall. 2 p.m.—Under the guidance of Dr. Langdon Down, a party will visit Hampton Court Palace and Gardens, proceeding thence by river to Hampton Wick, where they will be entertained by Dr. Down at a garden party at his residence, Normansfield. The members can reach Hampton Court either by the road, the river, or the rail. A special train will leave Waterloo Station (South-Western Railway) at 2 o'clock.

Sunday, August 7th. 1.30 p.m.—A special train will leave Victoria Station (Brighton and South Coast Railway) for Boxhill, situated in a beautiful part of the County of Surrey. At Burford Lodge, close to the station, Sir Trevor Lawrence, Bart., M.P., will receive a party of the members of the Congress at luncheon. The train will return from Boxhill to London at 6 p.m.

Monday, August 8th. 11 a.m.—Visit to the Docks, under the guidance and hospitality of Sir George Chambers, Chairman of the London, St. Katherine's and Victoria Dock Company. A limited number of members will proceed to St.

Katherine's Dock house on Tower Hill at 11 a.m., where the indigo and tobacco floors will be inspected; and in the adjoining London Dock, the ivory, drug, spice and wool floors, and the largest wine vault. From the Shadwell Basin, a steamboat will then take the party, for whom Sir George Chambers will provide luncheon on board, down the river to Victoria Docks. Having passed through the Royal Victoria and Royal Albert Docks, the party will return by the river to Charing Cross Pier.

REGISTERED FOR TRANSMISSION ABROAD.

“SALUS POPULI SUPREMA LEX.”

WEDNESDAY, JULY 13, 1881.

THE RELATIVE VALUE OF CALF AND HUMANISED VACCINE LYMPH.

THE widespread and serious outbreak of small-pox that has been prevalent for some months, has once more drawn attention to the value of vaccination as a protective measure, to its coincident dangers, and also to the identity of small-pox and vaccinia, or rather to the question as to whether they are identical. Of the value of vaccination, there can be no doubt whatever that, when properly performed, it is as protective as any measure of this kind can be. Clinical and everyday experience are altogether in favour of this view; the amount of evidence in this direction is absolutely overwhelming. But to be an efficient protection vaccination must be perfect, not only as to the time and the manner in which the operation is performed, but also with regard to the character and quality of the vaccine matter used for inoculation. If ordinary circumspection is exercised, the risks of vaccination are almost *nil*; but this circumspection must be

extended not only to the way in which the operation is performed, but also to the source of the lymph employed.

Whether the vaccine virus may become contaminated or enfeebled by its passage through countless generations of human beings—whether human disorders of an inoculable character may become engrafted on the vaccine malady, and be transmitted by vaccination to future generations,—or whether, in its transference from one individual to another, it may become degenerate, and thus lose its protective influence—are questions of the deepest moment, and which await solution.

But pending an affirmative or negative response to them is it not reasonable to suggest that, if any doubts whatever exist as to the contamination or diminished potency of the inoculating material, recourse should be had to the original source of this virus—to the natural vaccine disease in the bovine species? That this malady is still prevalent, and that lymph for vaccination purposes is obtained direct from cows affected with the so-called “spontaneous cow-pox,” is shown in the recent exhaustive treatise on “Human and Animal Variolæ,” (a) by Mr. Fleming, wherein we have the relations existing between the variolous disease of different animal species, and their dissimilarities pointed out. One startling fact brought out by Mr. Fleming's researches is that human small-pox and the cow-pox are two independent maladies, as distinct in their pathology and pathological anatomy as any two transmissible diseases possibly can be. We have said that this is a startling fact, and the truth of this is evident when it is known that nearly all, if not all, the medical authorities in this country believe that cow-pox is only small-pox conveyed from man to the cow. It would appear that early in this century certain experimenters, as Thiele, Badcock, Ceely, Burrows, and one or two others, fancied they had, by inoculating cows with small-pox matter, produced veritable vaccinia in them and from this suppositious vaccine disease matter was collected and extensively used for vaccination purposes. From what Mr. Fleming states—and his statement is certainly supported by everything we know with regard to the specific character of these transmissible disorders—it is utterly impossible to produce vaccinia from human variola. In their chief features the two diseases are remarkably distinct, and all recent attempts to transform one into the other have failed. Experiments on the largest scale have been conducted in France, Italy, England, and other countries, but all have failed to produce cow-pox by inoculating cows with small-pox matter.

It is very extraordinary that the facts and arguments brought forward by Mr. Fleming should not have been present to the medical authorities in this country who believe in the, as they appear, very misleading experiments of Mr. Ceely, who seems on one occasion to have mistaken the foot-and-mouth disease of cattle for transmitted small-pox. Vaccinia, according to Mr. Fleming, is a local, benignant, and inoculable, but non-infectious disease, while small-pox is a general, eruptive, very fatal, and extremely infectious disorder. Mr. Ceely and his

(a) “Human and Animal Variolæ.” By George Fleming, F.R.V.S., President of the Royal College of Veterinary Surgeons. London: Baillière, Tindall & Cox. 1881.

followers would have us believe that the latter, by one transference to the cow, can become converted into the former, and, when re-transferred, to mankind, it never assumed its original characters, though planted in its native soil, and cultivated through generations of people. Surely, on the face of it, such a notion is absurd.

Not only is this so, but Mr. Fleming, extending his observations to all the domesticated and wild creatures, demonstrates that each has a form of variola peculiar to itself, and that, while the variola of one species may be protective to another species against its variola, yet that this does not hold good through all the species. Sheep-pox, for instance, when inoculated in man; will not protect him from an attack of small-pox, though the resemblance between the two kinds of variolæ is of the closest kind; neither will vaccination protect sheep from sheep-pox.

If it be admitted that Ceely, Badcock, and others did not engender cow-pox by inoculating cows with small-pox matter, the question arises—What did they produce? There is only too much reason to apprehend that they only produced a localised small-pox eruption, and that the virus they obtained from it was not that of vaccinia, but of small-pox. When we know that this virus was largely employed to vaccinate children, we can form our own conclusions as to the result.

In the meantime, no efforts should be spared to obtain material for vaccination from the original source—the natural cow-pox. In Mr. Fleming's pamphlet, we observe that cases occur in various parts of the Continent, as well as in the north of Scotland; and, probably, if inquiries were made, they would be found to exist in England or Wales. We do not believe in the possibility of producing vaccinia from small-pox, nor yet have we much faith in the supposed advantages resulting from retro-vaccination. We therefore hold that if any change is to be made in the system of vaccination, that should commence with vaccine lymph derived from the natural cow-pox.

The extensive correspondence in our present issue confirms the idea that the subject of these remarks is of wide-spread interest, and that a healthy spirit of inquiry is abroad, which cannot but be productive of good.

THE IRISH COLLEGE OF PHYSICIANS AND MEDICAL REFORM.

At a special business meeting of the College, recently convened to consider the minutes of evidence to be submitted by the registrar on behalf of the College to the Royal Commission on the Medical Acts, the following resolution was adopted, namely:—"That it be an instruction to the registrar to state to the Royal Commission that this College is prepared to accept legislation based upon the following lines:—1. That no person shall be allowed to hold a public appointment until he shall have passed a public examination conducted under the authority of the Government. 2. That no candidate shall be admitted to such public examination without the production of diplomas in medicine, surgery, and midwifery from bodies authorised to confer the same."

This very peculiar pronouncement by the College places it, we believe, in a position of complete isolation,

not only from all other licensing bodies, but from the policy which reformers have regarded as practical or possible. The College, in fact, adopts Mr. Errington's Bill, a measure which has hitherto been thought to have had not a single admirer, save the late Sir Dominic Corrigan, who gave birth to it, and the hon. member who performed the delivery and subsequently nursed the bantling.

It will be observed that the Irish College of Physicians proposes that there shall be a State examination (not necessarily a conjoint examination), superior and subsequent to all collegiate examinations, and that no one shall be admitted thereto until he has obtained a triple diploma from one or more Colleges. But the resolution adopted does not say that there shall be any uniformity of standard of examination, curriculum, or fee amongst the examinations for these diplomas, so that it would seem that the College contemplates with serenity the indefinite perpetuation of the existing Dutch-auction system of competition amongst the nineteen licensing bodies. This competition—be it observed—must necessarily be increased by the superposition of a State examination upon the diplomas, and for the simple reason that the State examination would deprive all inferior examinations of any *prestige* whatever. As no diploma would have any validity for the public service, it is manifest that the student would seek the easiest and cheapest he could possibly find, and would rest his professional *prestige* altogether upon the State examination. Why should he pay a shilling more, or expend an hour's more work than is absolutely indispensable to obtain a diploma which would be immediately superseded by the State examination? Certainly his desires would be toward the nine and eightpenny license of the Irish Apothecaries Hall, or the year and nine months curriculum of other licensing bodies, rather than the more extended and expensive diplomas of the Irish Colleges of Physicians or Surgeons.

This, however, is not the only nor the chief objection to the Corrigan-Errington scheme. It will be seen that it proposes that this State examination shall be required only in the case of practitioners "allowed to hold a public appointment." This means that, while the Poor-law medical officer or army surgeon would be required to submit to the State test, private practice should be unreservedly open to diploma holders who had passed no examination, save that of his college—degraded as that examination would be by the influence to which we have already referred. Thus would be created within the profession two recognised ranks of practitioners, the State examinées, whose competency, was guaranteed, struggling for life in competition with the diploma holders, whose competency was an unknown quantity, but who were, nevertheless, legally entitled to kill or cure the general public. We need hardly descant upon the chaotic outcome of such a system, and the certainty that all the evils under which the profession now groans would be aggravated thereby.

We find ourselves totally unable to comprehend the line of reasoning by which the Irish College of Physicians could have arrived at such a singular conclusion. Reasons, we assume, must have been forthcoming, though

they have not been appreciable to us. We cannot, however, but regret that the College, as an influential representative of Irish medical opinion, should go before the Royal Commission with a programme which is not likely to have the support of any party in either the obstructive or the reform camps. It would, we think, have been more diplomatic to take up a policy in which the College could hope for the co-operation of admirers of some shade of opinion.

THE MORALITY OF DOCTORS.

WE referred in a recent issue to the fact that Dr. W. B. Carpenter was announced as having in preparation a reply to the ignorant nonsense which, under the title "Morality of the Medical Profession," had appeared in the April number of a comparatively new magazine called the *Modern Review*. We ventured to comment on the advisability of not paying any serious heed to the malignant splutter contained in the anonymous essay, and we feel that Dr. Carpenter will at least agree with us now that he has incurred by his act a celebrity of connection such as it is inconceivable he had any idea of courting. Side by side with the dignified and scholarly protest of the late Registrar of the University of London, the current number of *Modern Review* contains a second reply to the original slanderous article, purporting to be written by "Two of the Profession," and which, from its ridiculous pretentiousness, as well as from its flagrant offences against the highest canons of medical conduct, deserves to be ranked as equally ill-judged with the production that called it forth. Dr. Carpenter has, indeed, imported into his share of the discussion the authority attaching to a well-known name—that at once of a scientific *savant*, of one holding an unassailable position in the social world, and of a highly-esteemed gentleman. As would be expected, his reply to the charges brought against the profession of which he is a member is remarkable for the calm unhesitating assurance of the vindication it conveys; and in so far as it is the utterance of a great and experienced mind, it is invaluable. Whether, however, Dr. Carpenter has been well advised in assuming the task he has imposed upon himself—entirely apart, that is, from the question whether any notice at all of the anonymous revilings had been politic—we still presume to doubt, notwithstanding the intrinsic excellence of the reply. We cannot conceal the patent fact that it is the *practice* of medicine that is aspersed by all the numerous calumniators who have arisen of late. They are utterly ignorant of the commonest, most elementary, scientific principles by which that practice is guided; they are animated, as a rule, by some fanatical jealousy that blinds their better nature; and their eagerness to defend some mistaken theory develops into splenetic hatred of all that apparently interferes with the development of their cherished schemes. Hence it is that anti-vaccinators, anti-vivisectionists, homœopaths, and humbugs of every description, whose influence is derived from negation of established truths, are banded together in pursuit of a common enemy—the educated man of medicine. Zealous by reason of their sublime ignorance, they are absolutely incapable of attacking the object of their hatred through discussion of the

science which is the light of medicine; and they are thus compelled either to resign the combat, or to engage in other tactics. Foiled in every encounter where unenlightenment has entered the lists against truth and knowledge, they have now turned furiously on the only point seemingly left open to them, and that is the practice of the profession. It has unfortunately happened that, at exceedingly long intervals, acts of an irregular description have been committed by men holding medical qualifications; but can this be matter for serious wonder when we reflect that the number of practitioners in the kingdom exceeds 24,000? Of no profession or calling can it be said that so few of its members are found forgetful of the duties they owe to the world and to themselves as is the case with the profession of medicine. We do not propose, however, in this place, to defend it from the insults that are being heaped on it on every side; we are anxious rather to urge the consideration of the question—How far is it likely to avail to descend to justifications or explanations which it is an indignity to expect, as to utter? There may be some reason in acceding to an outspoken request for information when that request is made in good faith, with an honest intention, and unshielded by deceitful anonymity. But when calumnious falsehoods are written about us by those who pen their words behind the cowardly cloak of concealment, who are too profoundly ignorant of the subject they dare to discuss, to save themselves from constant commission of most absurd mistakes. Then surely it had been far more becoming the dignity of medicine to leave unnoticed and uncared for the libels of unknown foes. That the truth of this reflection has not been appreciated is, we take it, one chief reason why the libellers of medical men proceed from time to time to fresh outrages. It has been brought to our knowledge, indeed, that within the past few weeks the number of local newspaper correspondents who have been inspired with a burning wish to introduce reform into the practice of medicine, and to expose its many evils, have undergone a large accession. One such may be taken as a sample of all. Each is penned by someone enjoying the most perfect ignorance of the subject of his communication, and every one is signed with a *nom-de-plume*. This is at once instructive and suggestive. The amiable alacrity with which far-seeing editors of magazines of doubtful circulation agree to admit to their pages articles concerning the truth of which they must be very exceptionally placed to be enabled to decide, but which bear evidence of a likelihood of exciting disgust and reprisal from those whom the malign is primarily to blame for the injustice done to the profession of late. It is a matter for much congratulation that the high-class reviews do not descend to the tactics indulged in by such as appeal to a less cultured order of readers; but this ought not to satisfy us that the possible harm is any the less in extent. It is just the unintelligent classes who are most influenced by a sensational appeal to their feelings; they are guided only by the impulse of the moment, and whoever will play upon their susceptibilities is assured of a generous following. Interested agitators are too well aware of this weakness to omit the opportunity of turning it to their own advantage; and it is to them we are indebted for the evil outpourings of malicious envy that the general public are being supplied with on the subject

of medical men and morals. Once more, then, would we insist on the wisdom—nay, the necessity—of neglecting the silly vapourings, even though they do present harm. In time the authors of them must reveal themselves and their purpose, and the revelation will be condemnation.

We congratulate Dr. Carpenter on his able and eloquent reply. We deeply commiserate him on being associated in the matter with two anonymous lights (?) of the profession. These gentlemen (?) are earnest in what they say, possibly, but there is too much assertiveness about their production for it to possess weight. Both "entirely disapprove of vivisection, save, &c.;" "One is a strenuous advocate for the abolition of the Contagious Diseases Acts," &c. These anonymous friends to medicine, who are they?

Notes on Current Topics.

The Windsor Review.

THE arrangements in connection with the Volunteer Ambulance Corps were planned by Surgeon-Major Shelton, of the Army Medical Department, the Corps being under the command of Surgeon-Major Gasteen, A.M.D. Two field hospitals were established in the Great Park, one being placed under the shade of the trees at the rear of the rendezvous of the First Army Corps, and the second to the rear of the Second Army Corps, near Bear's Rails. Each hospital was composed of about seven tents, with sets of panniers and field companions, bearers, water-bottles, and other requisite appliances, three waggons, with six large stretchers and twenty field stretchers, one general service waggon, two water carts, and all other appliances. Their services proved very valuable, as the number of cases receiving treatment amounted to about a hundred and fifty. Ten of these were said to be from sunstroke. The other casualties comprised sprains, contusions, and faintings, most of which received immediate medical relief in the field, the more serious cases being removed to the hospitals for careful treatment. All but eight of the sufferers were able to rejoin their corps or leave for their homes in the course of the evening, the worst case, one of sunstroke, being eventually removed to the Guards' Hospital at Windsor, while the Adjutant of the 1st Surrey Artillery, who fell from his horse and received a severe contusion on the back, remained in the field hospital at the Cavalry Exercise Ground until Sunday afternoon, when he was removed to his own home in London.

It was curious to notice the effect of a case of syncope upon other members of the same corps. Doubtless many men who were fatigued and inclined to faint, bore up against their feelings, but immediately gave way on witnessing the first case of syncope. In one corps no case of fainting occurred until about four o'clock, when it was immediately followed by four others in the same company. Some of the cases of syncope were very prolonged, the patients lying pulseless, and without any attempt at respiration. Artificial respiration was performed with success. Great credit is due to the authorities for the arrangements made. Water was laid on for men and horses in all parts of the rendezvous, and large quantities of ice supplied,

whilst the other requirements of the men were, in nearly all regiments, well attended to by the quartermasters.

A Melancholy Accident.

It is with very deep regret we announce the death of Mr. Stephen S. Alford, F.R.C.S., whose frequent contributions to our columns have made his name familiar to our readers. Mr. Alford's death was caused through an accident; he having been knocked down by a luggage train while crossing a level at Dudding Hill station, on the Midland Railway. The occurrence took place a few days since, and resulted in the fracture of several ribs, and such injuries to one foot as necessitated its amputation by Mr. Erichsen, who was in attendance on the sufferer. Mr. Alford, however, never rallied fully, but succumbed to shock three days after the occurrence. An obituary notice by an esteemed contributor, one who had intimate personal knowledge of the deceased, will be found in another column.

Vivisection.

THE anti-vivisectionists will be afforded excuse for an alarming accession of rage and declamation in the report from the inspectors appointed under Government to examine into the experiments conducted by physiologists supplied with licenses to pursue knowledge. The total number of such experiments in 1880 was 311. Experiments performed by persons holding certificates authorising them to operate upon unanæsthetised living animals, amounted in number to seventy-nine. Sixty-nine of these were simply indentations, and wholly painless, in thirty-eight being succeeded by no ill-effects. The remaining ten will, of course, form the basis of anti-vivisection anathemas, but in none of these ten cases was any pain inflicted more than that caused by passing a needle through a fold of skin. The experiments "performed on living animals, free to feel pain but powerless to avert torture," and which are so carefully pictured to the vulgar crowds in low shops, and on the hoardings of towns, were conspicuous by their absence; indeed, stranger to relate, no physiologist seems to have availed himself of the opportunity by unnecessary cruelty, and this will doubtless puzzle the anti-vivisection party to account for. The report effectually demonstrates the absurdity of the restrictions imposed on science by the Act.

The Religious Aspect of the Contagious Diseases Act.

WE note with satisfaction that *The Church of England Pulpit*, an influential representative of religious journalism, has spoken out honestly against the goody-goody antagonism to the Contagious Diseases Acts. "The Acts," it says, "are designed solely to prevent a most fearful contagious disease, which besides breaking up the health of the patient himself, is always passed on to a future innocent wife and children, as well as to the children's children for several generations. These Acts have been most successful in preventing a terrible disease, and we cannot, after a most careful consideration of all the evidence that has been adduced, see anything unjust, immoral, or unscriptural in their provisions. Their main provision

is that women in the scheduled districts, who make a trade of prostitution, are not allowed to carry on such a trade whilst they are in a state of disease, which they are sure to communicate to others; but are to be sent into hospital and treated at the public expense until they are cured. This is an interference with personal liberty, but not greater than that to which thousands of the poor who contract small-pox are subjected. The trade is also interfered with, but not one whit more than any other dangerous trade. In fact, the great moral advantage of this legislation is that it restricts and discourages prostitution. We should be glad to see the Acts extended to all large towns.

"Crown's Quest" Verdicts.

A RULE *nisi* for a *certiorari* has been granted by the Queen's Bench in London, to set aside an inquisition held by the Coroner for Somersetshire in the matter of a man—the Quartermaster-Sergeant in the 1st Somerset Militia—who was taken ill suddenly, suffered from sickness, and of which illness he died. In April the coroner's jury sat on the body. There was an absence of direct evidence as to the cause of death, but the jury returned a verdict that the deceased had "died suddenly by the visitation of death." On a post-mortem examination being subsequently made at the request of the relatives, a large quantity of arsenic was discovered in the body, and in consequence the finding of the jury was not considered satisfactory; moreover, the coroner had written a letter, verified by affidavit, that in his opinion there ought to be further inquiry. The inquest will be quashed, and another coroner's inquiry held.

An American Adulteration Act.

At the commencement of the present month an "Act to Prevent the Adulteration of Food and Drugs" came into force in the State of New York, which presents some points of interest in its definitions. To commence with, the term "drug," as used in the Act, includes all medicines for internal or external use. A drug is deemed "adulterated," (1) if, when sold under a name recognised in the United States' Pharmacopœia, it differs from the standard of strength quality, or purity laid down in that work; or (2) if, when sold under a name not so recognised, but found in some other pharmacopœia or standard work on materia medica, it differs materially from the standards there laid down; or (3) if its strength or purity fall below the professed standard under which it is sold. The State Board of Health, which is entrusted with the supervision of public analysts and chemists under the Act, is also charged with the duty of from time to time fixing the limits of variability permissible in any drug or compound the standard of which is not fixed by any national pharmacopœia. The penalties under the Act are for the first offence fifty dollars, and one hundred dollars for a second or subsequent offence. The Act is almost identical with one that has been recently passed by the Legislature of the State of New Jersey.

SURG.-MAJOR SANDFORD MOORE, M.A. and M.B. Lond., was admitted a member of the Bar, Inner Temple, on the 29th ult.

Superannuation of Poor-law Officers.

IN the House of Commons on Friday week Mr. Slater-Booth asked the President of the Local Government Board whether his attention had been called to the anomalous condition of the existing law and practice relative to the superannuation of Poor-law officers, by recent cases which had occurred in the two adjacent unions of Farnham and Alton, a superannuation allowance having been granted in the former union, and refused in the latter, to an officer of advanced age and long service; and whether he had it in contemplation to propose an amendment of the law with a view to greater uniformity in future.—Mr. Dodson: My attention has been called to these two cases, and I cannot but regret that they were not dealt with by the guardians of the two unions on the same favourable principle; but, as the right hon. gentleman is aware, the grant of superannuation allowance is entirely within the discretion of the guardians, the Board having no jurisdiction to require them to grant a superannuation in any case; and it would be a matter requiring very serious consideration, to undertake to propose an amendment in the law which would deprive the guardians of their discretionary power.

The Election at the Royal College of Surgeons of England.

THE result of the election for members of the Council on Thursday last was as follows:—Paget, 228 votes, with 1 plumper; Hulke, 137 votes, with 9 plumpers; Heath, 133 votes, with 5 plumpers; Croft, 113 votes, with 18 plumpers; Harrison, 87 votes, with 12 plumpers; Walton, 72 votes, with 5 plumpers. Sir James Paget was, therefore, re-elected; and Mr. Hulke and Mr. Heath were elected to replace Messrs. Walton and Wheelhouse, the latter gentleman not offering himself for re-election. The provincial candidate fell short of election by nearly fifty votes, but as his Fellowship dates some six years later than that of any other candidate, he could scarcely have expected any other result. The very large number of votes polled by Sir James Paget show an almost unanimous opinion on the part of the Fellows that Sir James should still hold office; whilst the few plumpers recorded in his favour are accounted for by the fact that it was confidently expected he would be returned.

The Medical Sanitary Exhibition.

THIS Exhibition, which is to be opened next Saturday under the auspices of the Council of the Parkes Museum of Hygiene, at South Kensington, promises to be a gigantic success. The opening ceremony takes place in the Royal Albert Hall, when the President, the Right Hon. Earl Spencer, K.G., will take the chair at 4.30 p.m., supported by the Right Hon. Earl Granville, K.G., the Right Hon. John G. Dodson, M.P., Sir James Paget, Bart., D.C.L., LL.D., F.R.S., President Elect of the International Medical Congress; John Eric Erichsen, F.R.S., President of the Royal College of Surgeons. The admission on the opening day will be five shillings; afterwards, one shilling each day. The Exhibition will be open for a month, during which time we shall devote a series of special supplements to a description of its exhibits.

The Ophthalmological Society.

THE first annual meeting of this Society was held on Wednesday last (July 6th), when Mr. Streatfeild, Treasurer, read a report which showed the finances of the Society to be in a satisfactory condition. The President (Mr. Bowman), in a short address, passed in review the history of the Society during the past year, the first of its existence; he referred in congratulatory terms to the debate on optic neuritis, and to the report of the Committee on Colour-Blindness; and stated that one hundred and forty-one members had now joined the Society, and that of this number about fifty were physicians not specially engaged in ophthalmic practice. The meetings had been well attended, both by members and by visitors; and the supply of papers and cases had been well kept up. The plan of showing specimens and living patients by card has been found to work well. The following gentlemen were elected to fill the offices of the Society in the ensuing session. *President*—William Bowman, Esq., F.R.S., LL.D. *Vice-Presidents*—George Critchett, Esq.; *J. W. Hulke, Esq., F.R.S.; J. Hughlings Jackson, M.D., F.R.S.; *Argyll Robertson, M.D. (Edinburgh); *Frederick Mason, Esq. (Bath); *Augustin Prichard, Esq. (Clifton); *Treasurer*—J. F. Streatfeild, Esq. *Secretaries*—Stephen Mackenzie, M.D.; E. Nettleship, Esq. *Other Members of Council*—James E. Adams, Esq.; *Edwyn Andrew, M.D. (Shrewsbury); W. A. Brailey, M.D.; R. Brudenell Carter, Esq.; *Thomas Buzzard, M.D.; *John Couper, Esq.; W. R. Gowers, M.D.; C. Higgins, Esq.; Henry Power, Esq.; J. Vose Solomon, Esq. (Birmingham); Waren Tay, Esq.; *T. Shaldford Walker, Esq. (Liverpool). The gentlemen whose names are marked with an asterisk (*) were not in the Council, or did not hold the same office during the preceding year. It is hoped that the first volume of the *Transactions* will appear in October.

Involuntary Homicide.

A RATHER interesting suit was lately brought before the Tribunal Correctionnel, Brussels. The defendant, a medical practitioner at Etterbeck, was accused by the children of a late patient of having hastened the death of their father by mistaken treatment. The treatment in question was a sub-cutaneous injection of five milligrammes of morphine, which caused intoxication, the injection being used as a palliative, the patient suffering from rheumatic pains.

The opinions of the medical men who appeared as witnesses were favourable to the defendant, especially the opinion of the medical expert appointed by the Court, who, having made a post-mortem examination, declared that the patient had been suffering from heart-disease, articular rheumatism, and intestinal cancer; that the puncture had not penetrated a vein; and that the patient had succumbed to one of these various diseases; and added that the amount of morphine injected would act simply as an anodyne. The tribunal, in conformity with the evidence given, pronounced the following judgment:—"Seeing that the charges laid against defendant have been in no wise substantiated, and taking into consideration the rashness and hastiness of the plaintiffs in bringing so prejudicial an accusation against the defendant, the Court fully acquits the defendant and condemns the plaintiffs to

pay to him the sum of 1,000 francs damages, this sum having been claimed by defendant in proper legal form."

We have been informed further that the action would probably not have been taken had not the plaintiffs been instigated thereto by a treacherous professional rival.

Quadruple Birth near Strabane.

THE wife of a farmer, near Strabane, was safely delivered last week of four sons at a birth by Dr. J. C. Boyd. The mother and infants are doing well, and the latter appear to be quite healthy. Is there a similar case on record where four living and healthy children were born together?

Dr. Boyd, Strabane, was, in the same week, unanimously appointed physician and surgeon to the Donegal County Infirmary, *pro tem*.

International Pharmaceutical Congress.

THE president, vice-president and council of the Pharmaceutical Society of Great Britain have invited the members and associates of the Society to meet the visitors to the Congress at a *conversazione* to be held at the House of the Society on the evening of Saturday, the 30th inst., at 7 o'clock.

On Tuesday, the 2nd of August, there will be a banquet at Willis's Rooms in honour of the foreign visitors to the Congress, who will be entertained by the members of the Pharmaceutical Society and their friends. An excursion of the Congress is being organised for Thursday, August 4th.

Medical Society of London.

It is intended to elect the following gentlemen as Honorary Fellows:—Professor Bamberger, Dr. J. H. Billings, Dr. Bigelow, Professor Billoth, Professor Charcot, Professor Da Costa, Dr. Emmett, Professor Haller, Professor von Nussbaum, Professor Tarnier, Professor Verneuil, Professor Volkmann. Professor Raynaud, whose death has recently occurred, would also have been proposed for a similar honour.

THE arrangements for the jubilee meeting of the British Association, to be held from August 31st to September 8th, at York, under the presidency of Sir John Lubbock, are now complete.

IN the *New York Medical Record* Dr. J. Waner states that he has found Fowler's solution of arsenic, given in drop doses on an empty stomach, the best remedy in the sickness of pregnancy, when this is purely sympathetic in character, the effect being almost magical.

THE gold medal presented by Dr. Hayden, physician to the Mater Misericordiae Hospital, Dublin, for competition among the clinical students, was presented last week at the conclusion of the session. Mr. T. Donnelly, B.A., T.C.D., was awarded the prize.

ON the 13th October, on which day Professor Virchow will have completed his sixtieth year, a fête will be held in honour of his having completed the twenty-fifth year of his

professorship. Virchow was appointed, in May, 1856, ordinary Professor of Anatomy in the University of Berlin in which chair he has since continuously taught.

THE annual rates of mortality last week in the principal large towns of the United Kingdom per 1,000 of the population, were—Plymouth 13, Salford 13, Hull 14, Nottingham 16, Sheffield 16, Birmingham 17, Dublin 18, Sunderland 18, Norwich 18, Wolverhampton 18, Manchester 18, Brighton 18, Bristol 18, London 19, Edinburgh 19, Portsmouth 19, Newcastle-on-Tyne 20, Leeds 21, Leicester 22, Bradford 22, Glasgow 23, Oldham 24, and Liverpool 25.

In the principal foreign cities the rates of mortality, according to the latest official weekly return, were in—Calcutta 22, Bombay 36, Madras 39; Paris 26; Geneva, 17; Brussels 20; Amsterdam 21, Rotterdam 16; The Hague 16; Copenhagen 26, Stockholm 23, Christiana 22; St. Petersburg 61; Berlin 30, Hamburg 23, Dresden 22, Breslau 40, Munich 40; Vienna 31; Buda-Pesth 33; Turin 27; Venice 18; Alexandria 33; New York 27, Brooklyn, 17, Philadelphia, 18, Baltimore, 19 per 1,000 of the various populations.

FROM diseases of the zymotic class last week in the large towns measles showed the largest proportional fatality in Liverpool, Glasgow, and Bristol; scarlet fever in Leicester and Nottingham; and whooping-cough in Birmingham, Leicester, and Portsmouth. The 27 deaths from diphtheria included 18 in London, 3 in Liverpool, 3 in Glasgow, and 2 in Portsmouth. Small-pox caused 56 more deaths in London and its outer ring of suburban districts, 5 in Liverpool, one in Brighton, one in Oldham, and not one in any of the other large towns.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

EDINBURGH CONVALESCENT HOME FOR CHILDREN.—A convalescent home for children was opened on the 4th inst. at Gilmerton, Edinburgh, under encouraging auspices. A large number of ladies and gentlemen interested in the undertaking met in the afternoon at the Home, which was tastefully decorated for the occasion by the inmates of the Ravenscroft Convalescent Home for Adults, which is quite near, and is the parent of the Children's Home, both being under the same management and supported in the same way, by voluntary contributions. The Rev. Dr. Sandford commended the Institution to the liberality and sympathy of all friends of the poor, and trusted that their expectations regarding it would be fully realised. The Home, which is beautifully situated in the village of Gilmerton, has a splendid view of the country to the south.

SUSPECTED MILK-POISONING AT GLASGOW.—Early on the morning of the 7th inst. at the Orphan Home, James Morrison Street, the boys and girls to the number of forty were affected with symptoms of irritant poisoning. Some of the boys, less severely affected, went to their work and had to return to the Home from their employment. Dr. T. Brown Henderson was speedily in attendance, and the urgent

symptoms were soon relieved. Some of those who partook of the suspected article—milk—were not, or very slightly, affected; but those who had taken it more freely were more seriously ill. Dr. Russell, the medical officer of health, in the course of the afternoon made an inquiry into the existing state of matters, and into their probable cause. The symptoms from which the children suffered were violent purging and vomiting, with irritation of the stomach. Samples of the milk were taken for analysis. The result has not yet been made public.

THE MORTALITY OF GLASGOW.—The deaths in Glasgow for the week ending with Saturday, the 2nd inst., were at the rate of 24 per 1,000 per annum, against 22 in the preceding week, and 22, 21, and 23 in the corresponding periods of 1880, 1879, and 1878.

THE MORTALITY OF EDINBURGH.—The number of deaths during the week ending Saturday was 78, exclusive of eight country deaths, or 18 per 1,000 per annum. This is 12 below the weekly average of last year. Last week the deaths numbered 72, while in the corresponding week last year the number was 93. Five deaths from scarlatina and two of whooping-cough occurred in the New Town, while in both Old and New Town one fatal case of fever is reported. The southern suburbs still remain free of zymotic diseases. During the week 147 births were registered, of which 10 were illegitimate.

THE COMBE LECTURES.—In the Combe lecture, which was delivered in the Watt Institution on the 7th inst., Dr. Andrew Wilson spoke on the subject of ventilation and the importance to health of keeping sweet and pure the air in houses and cities. In pure air, such as was found on the summit of the Scotch hills, the proportion of carbon found was between 3 and 4 volumes in 10,000. In observations which were made in 1864 as to the quantity which accumulated in crowded halls, it appeared that in the Chancery Court, the standard being 10,000 volumes, it was 19·3; in the gallery of the Strand Theatre during a performance, 10·1; while in two pits of London Theatres it attained to 25·2 and 32·0 respectively. Fresh air was as much a factor in healthy life as wholesome food.

Correspondence.

CALF LYMPH.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The recent epidemic of small-pox in the metropolis has put a practical aspect on the question as to the relative values of calf and humanised vaccine lymph.

Before resorting to the employment of the bovine virus I deem it essential to ascertain the source and nature of this lymph, which is being so warmly advocated and widely advertised.

My investigations have led me to the conclusion that calf or animal lymph is a name applied indifferently to at least three different commodities possessed of the most entirely different properties.

1. There is the lymph obtained by Messrs. Ceeley, Badcock, Burrows and Thiele, by inoculating the cow with the human small-pox virus; this, however, it would appear from the conclusive experiments of the Lyons Commission, never produces cow-pox, when it produces anything, it is true small-pox, and capable of propagating that disease by infection.

2. There is the lymph obtained by inoculating the calf with ordinary humanised, retro-vaccination as it is called; a plan which fails at the outset, since it does not insure the elimination of the much dreaded human impurities.

3. And this is the common source, there is the lymph got from cases of spontaneous cow-pox, and propagated on a series

of heifers. This (bovine disease apart) would commend itself warmly to the minds of many, but strange to say, this very lymph has been denounced in no measured terms by "the immortal Jenner" as unprotective against small-pox (pp. 7 and 8 of Jenner's Inquiry.)

I trust you and your readers will kindly explain my difficulty, and set me right if I be in error.

I am, Sir,

Yours obediently,
W. J. COLLINS, B.Sc., M.R.C.S.

St. Bartholomew's Hospital,
Smithfield, 20th June, 1881.

* * The above letter appeared in our issue for June 29th, to which the following replies have been received.—ED. M. P. & C. :—

1. L'enquête lyonnaise a donné le dernier coup à l'idée représentée par Messrs. Coely, Badcock, Burrows et Thiele, laquelle enseignait que la variole de l'homme, confiée par inoculation à la vache, est restituée par celle-ci à l'état de vaccin. *CELA EST FAUX.* Quand on insère à un veau de la matière variolique, il fournit de la matière variolique. Il donne du cow-pox quand c'est du vaccin qu'on a semé. Jamais un individu n'a pu communiquer la variole pour avoir été vacciné. Jamais un veau n'a pu donner le vaccin pour avoir été variolé.

Le préjugé n'en existe et n'en persiste pas moins; les gens du monde se le passent et le repassent, et il se trouve des écrivains médicaux pour le soutenir et le relever, même au moment où l'on devrait le croire près de disparaître. Pour eux, la vaccine peut donner lieu à la variole. Cette prétention est fautive de tous points et nous allons le démontrer.

Il existe deux maladies distinctes et parfaitement connues aujourd'hui, quoi qu'on en puisse dire : la variole des animaux et la variole des gens. La première s'appelle *vaccine* (horse-pox ou cow-pox, selon qu'elle se rencontre chez le cheval ou chez la vache); la seconde se nomme *variole* ou petite vérole.

Les recherches récentes ont établi que LE VACCIN doit ses propriétés à un germe actif, s'attaquant aux chevaux et aux animaux de l'espèce bovine, et y produisant, par voie d'absorption générale (horse-pox ou cow-pox dits *spontanés*), une maladie offrant des caractères parfaitement déterminés.

On semble douter que le cow-pox puisse naître par infection générale, et l'on préfère attribuer les cas dits *spontanés* au transport direct, aux plaies des jambes des chevaux ou au pis des vaches, du virus variolique des mains des ouvriers ou des ouvrières de ferme. Mais depuis quatre-vingts ans que cette supposition court les livres, depuis les milliers de cas de horse-pox ou de cow-pox dits *spontanés* découverts de par le monde, où a-t-on jamais pris, en flagrant délit, cette main variolée? On en est encore à la découvrir et cependant les enquêtes n'ont pas manqué.

L'éruption qui se présente dans le horse-pox ou le cow-pox fournit un produit qui s'inocule spécialement au cheval, à la vache et à l'homme, et fournit à son tour un produit également transmissible; mais, ce qui caractérise ce dernier, c'est qu'il ne se communique pas à l'homme par voie d'absorption générale. On a vu le cow-pox régner épidémiquement dans les fermes. A-t-on jamais vu la maladie s'y communiquer à l'homme par infection miasmatique et y donner lieu à une éruption fébrile généralisée? Jamais.

Pour la VARIOLE HUMAINE, c'est le contraire; elle se transmet d'homme à homme par voie d'infection générale, mais jamais de cette façon d'homme à animal. Elle s'inocule au cheval et à la vache—et aussi à quelques autres animaux—par voie d'inoculation, mais point par une autre. On a vu la variole sévir épidémiquement avec la dernière rigueur dans des lieux occupés par des troupeaux nombreux. Où les a-t-on vu prendre la maladie par voie d'infection générale, c'est-à-dire participer à l'épidémie? Nulle part.

Est-il permis d'inférer de là qu'il y a deux virus distincts, celui de la variole des bêtes et celui de la variole des gens? Bien que les microbes signalés dans ces dernières années, dans l'une et dans l'autre, soient absolument semblables dans leurs propriétés morphologiques, on voudra bien nous accorder sans doute que les vaisesemblances sont en faveur de cette supposition.

Nous concluons de ce qui précède que, lorsqu'on se sert de la matière procurée par le procédé de Coely, on fait de la *variolation* et non de la *vaccination*. Il se peut que les

inoculés n'y perdent rien, puisque la première protège au moins autant que la seconde. Mais, est-il besoin de la faire remarquer? cette pratique est de nature à alimenter la variole par voie de contagion, et ne voit-on pas l'influence qu'elle a pu et dû avoir sur la propagation ou l'impatrimonisation de la maladie, partout où ce pseudo-vaccin était employé, en Angleterre et dans tous les pays qui avaient la naïveté de s'y aller pourvoir de ce produit, qui parfois n'était pas autre chose que du virus variolique.

Tout cela est bien fait pour donner à penser. Et qui nous dit que ceux-là qui ont écrit récemment, dans toute la sincérité de leur âme, nous le voulons croire: "*Ne vaccinez pas beaucoup d'enfants, en même temps dans le même endroit*" ou: "*Semez le vaccin vous récolterez la variole*" n'ont pas eux-mêmes fait de la variolation, sans s'en douter, et alimenté ou éternisé ainsi la maladie.

Cette explication est la seule que nous puissions accepter. Qu'on nous montre, en ce pays où les vaccinations se font toujours par fournées nombreuses, un seul cas où elles aient fait naître la variole et nous nous déclarerons vaincus; mais nous ne craignons pas que ce défi soit relevé. *On ne peut pas plus récolter la variole en semant le vaccin ni le vaccin en semant la variole que de l'orge en semant du blé.*

2. La *rétro-vaccination*, c'est-à-dire la culture du vaccin par le passage de celui-ci à travers la génisse, est certainement un bon moyen d'épuration et de multiplication. On objecte que l'on n'y trouve par de garanties suffisantes de l'élimination des impuretés humaines. C'est vrai, mais, en ce qui concerne la syphilis du moins, les garanties sont absolues, car la génisse est incapable de l'accepter et par conséquent de la donner; et c'est là le point essentiel. Pour les autres "impuretés," nous ne voudrions pas être aussi affirmatif, encore bien que nous ayons personnellement une grande confiance dans l'épuration procurée; mais enfin, il y a là un alea que l'on ne peut ni méconnaître, ni contester, un scrupule qu'il faut respecter. *Aussi avons-nous rejeté en principe la rétro-vaccination*, qui est d'ailleurs peu fidèle dans ses résultats, les souches ainsi produites ayant de grandes tendances à l'éteindre prématurément.

3. Le vrai procédé de *vaccination animale* est celui qui consiste à inoculer le cow-pox spontané à des veaux quand il s'en présente des cas, et à transmettre le produit ainsi obtenu à d'autres veaux et ainsi indéfiniment *sans que jamais il passe à travers un organisme humain.* C'est le procédé de culture suivi depuis treize ans, à l'Institut vaccinal de l'Etat, en Belgique. Les veaux employés sont des animaux bien sains, reconnus tels par des vétérinaires experts, et âgés de six semaines à trois mois. Chaque soir, nous en expédions, soit en tubes, soit sur pointes, à notre agent, à Londres (M. Darke, 3 Hemming's Row, St. Martin's Lane) qui le distribue, dans le Royaume-uni, 18 heures après qu'il a été recueilli, et les résultats obtenus ont dépassé toutes les prévisions: 90 pour cent, de succès dans les revaccinations.

On objecte que Jenner, l'immortel Jenner, a contesté au vaccin ainsi obtenu une vertu vraiment protectrice contre la variole. Jenner, tout immortal qu'il soit—et pour être génial on n'est par infallible—s'est simplement trompé. *Depuis seize ans que la plupart des vaccinations et des revaccinations se font, en Belgique, par notre vaccin, pas un seul des sujets ainsi imprégnés ne nous a été signalé comme ayant été atteint de la variole.*

DOCTEUR WARLDMONT.

Bruxelles, le 28 Juin 1881.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In your journal of June 29th, Mr. Collins correctly states that lymph derived from the inoculation of heifers with human small-pox matter must produce, not vaccinia, but a modified variola. But he does not appear to prove that the retro-vaccination of calves with human lymph is nearly, if not altogether, impossible.

The source of calf lymph now so extensively in use on the Continent, in England, and in America, is derived from instances of spontaneous vaccinia transmitted through a succession of calves by vaccination from calf to calf. Jenner was a great man, but he was not infallible, and he held some views regarding the origin of vaccinia in the heifer, which are now abandoned. If he taught that spontaneous vaccinia, as transmitted through heifers, was, when inoculated on the human subject, an inefficient protection against small-pox, he was in error; as it has been frequently demonstrated that a human

being, so vaccinated, cannot, within a given period, be, by artificial means, inoculated with small-pox matter.

Moreover, it has not yet been shown that any individual during the last ten years, who has been vaccinated with calf lymph, has ever taken small-pox.

While on this subject, I may add that the only objection I know to the use of calf vaccine is the irregularity of its action; for while most of the vesicles produced are of a convenient size, I have yet met with a considerable number of cases where they have become as large as a shilling, and accompanied by some excoriation. These excoriation, however, so far as I have seen, have always healed benignly.

I remain, Sir,

Your obedient servant,

GEORGE WYLD, M.D.

12 Great Cumberland Place, Hyde Park,
29th June, 1881.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In reply to your correspondent, I may say that the lymph of retro-vaccination has now been acknowledged by the best authorities to be non-protective. The present evidence goes to prove that vaccinia is a modification of human variola, and that Coely, Badcock, and Thiele were right, and the Lyons Commission wrong. The Beaugenz lymph is known to be thoroughly reliable and protective. It has been used for many years past by the best vaccinators in Europe and the United States, and is used by Dr. Renner in London with perfect success.

I may add that on June 21st I vaccinated *from calf lymph* thirteen patients—young women, from sixteen to twenty years of age; a week later (June 28th), I found all had taken perfectly. The lymph came from Utrecht, in Holland.

I am, Sir,

Your obedient servant,

CHARLES R. DRYSDALE, M.D.

Woburn Place, London.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I do not intend to offer an opinion as to the relative values of calf and humanised vaccine lymph, but I may state that Jenner was in the wrong when he asserted that vaccine lymph—*i.e.*, lymph obtained from cows affected with so-called "spontaneous" vaccinia—is unprotective against small-pox in man. He contradicted his own evidence, and that of others. Human small-pox is not vaccinia, and cannot be converted into that malady. All recent attempts to produce this conversion in France, Italy, and England, have yielded; and the two affections are widely and specifically different. This I have shown in my recently-published pamphlet on "Human and Animal Variolæ." Inoculating cows with small-pox matter, and re-inoculating people can have only one result—but not that of producing the vaccine vesicle.

I am, Sir,

Yours obediently,

GEORGE FLEMING, F.R.C.V.S.

The War Office, July 1st, 1881.

Obituary.

MR. S. SHUTE ALFORD, F.R.C.S.

STEPHEN SHUTE ALFORD, whose tragic fate in the midst of a career of active usefulness has sent a thrill of sorrow through wide professional and philanthropic circles, was an excellent type of an honourable Christian practitioner. Last week he was run over by a railway train, sustaining injuries necessitating partial amputation of both feet, and gradually sank, till he expired in a few days. Mr. Alford was a little over 60, but when so suddenly cut down was the very incarnation of industry and vigour. He has been in practice in Hampstead for nearly forty years; and the high esteem in which he was held by his patients and the

public has been evidenced by the deep interest with which the progress of his illness has been watched, and the widespread consternation at the fatal termination. He was a cousin and brother-in-law of the late Dean Alford, who had married his sister, and leaves a family of three, one of whom, Mr. Frederick Alford, was in partnership with his father.

Mr. Alford was the beau ideal of an untiring, courteous, and intelligent physician. He was the soul of honour, and in the wonderful tenderness of his heart there was no room for envy, hatred, or uncharitableness. He was utterly devoid of selfishness, the affairs of others ever having the first place in his affections. Though of late years his name was much before the public, this was the unavoidable consequence of his remarkable labours in social reform, and was greatly against his own desire. Modest and unostentatious, he was ever ready to acknowledge the deeds of others, and to give others the credit when he himself really did the work.

Mr. Alford was a marvel of industry. He was a member of the Hampstead Vestry, and a devoted Christian worker. In many professional associations he was a busy actor; and in such movements as the establishment of genuine provident dispensaries, he was an assiduous promoter. At the recent election for the Middlesex coronership he worked indefatigably and successfully for the medical candidate. In various departments of temperance effort he laboured with unflagging energy. He was a member of the Council of the Medical Temperance Association, having thrown himself with characteristic zeal into the total abstinence reform. His numerous and thriving coffee-stalls in the north of London are a living proof of the warm interest he took in this valuable method of counteracting our national vice. But to the movement for Legislation for the Control and Cure of Habitual Drunkards, Mr. Alford devoted his best endeavours, and consecrated his most unremitting exertions. When the late Dr. Dalrymple "fighting fell," his mantle seemed to have fallen on Mr. Alford, who thenceforward threw himself heart and soul into the agitation. The question of dipsomania he made peculiarly his own. At Social Science Congresses, British Medical Association gatherings, and innumerable other influential assemblies, did Mr. Alford read papers, or deliver addresses on behalf of the cause he had so deeply at heart. For years he had been the life and soul of the Habitual Drunkards' Legislation Society; and though bitterly disappointed at the inefficiency of the Act passed in 1879, through the good offices of Lord Shaftesbury and Dr. Cameron, rejoiced in its enactment as the affirmation of a principle. The pamphlets Mr. Alford published have done much to awaken the public to the claims and the needs of habitual inebriates, and our columns have again and again been enriched with contributions from him on this favourite subject. In his anxiety to become master of the successful treatment of dipsomania, Mr. Alford spent a few months recently in the United States and Canada, personally visiting and residing at a number of Transatlantic inebriate retreats. A synopsis of his observations thereon was presented to the Social Science Association, and obtained extended circulation. Mr. Alford literally died in harness; he was struck down while on his way to visit a patient; and to the last the Dalrymple Home was near his heart.

A few weeks ago we published his comprehensive and lucid opening of a discussion on "The Practical Treatment of Dipsomania," at the Medical Temperance Association. The paper excited so much interest that two adjournments of the discussion was found necessary. Mr. Alford was to have replied on Friday, but, alas, his place was vacant.

Thus has lived and died a true English gentleman. "Being dead, he yet speaketh" in the works of mercy and of love he has left behind him. The noblest tribute to his memory would be the realisation of the dream of his life—the establishment, under the provisions of the Act of 1879, of the projected Dalrymple Home for Habitual Inebriates. Can the profession of which he was so single-

minded a member leave the most cherished desire of his heart unfulfilled?

WE regret to learn by telegram from Demerara, of the sudden death of Dr. Ward, late M. P. for Galway.

THE evidence of Mr. John Marshall, F.R.S., of London, Dr. Waters, of Chester, Dr. Haldane, of Edinburgh, and Dr. Byass, of Cuckfield, was taken before the Medical Act's Commission last week.

A SEVERE epidemic of diphtheria has suddenly broken out at the fashionable bathing place of Stadsborg, near Copenhagen. Numerous deaths have taken place, and visitors are flying away panic-stricken.

Novelties.

MODIFIED FERGUSON'S SPECULUM (PATENT).

usacc.

WE are informed that this modification was suggested by Dr. J. H. Aveling, and it may be a useful one; but we fail to see the necessity of patenting so tiny an idea. The following is the description sent us: This altered form was made in consequence of the frequency with which the ordinary speculum is rendered useless and dangerous by its bevelled edge becoming denuded of its protective covering of varnish by friction, and the chemical action of solutions. When it has taken place a sharp rough edge presents itself. In this modification, instead of having the bevelled edge ground, it is fused, and being thus made smooth, no covering of varnish is required. The silvering and varnishing are stopped an eighth of an inch from the edge, leaving a bare polished rim of glass, which cannot be affected by any ordinary

Cleanliness and economy are secured by this modification. It is more cleanly because the slightest flaw in the varnished edge of the ordinary instrument offers a home for septic or specific discharges. It is more economical, because the speculum cannot be rendered useless by its bevelled edge becoming roughened and sharp. Mr. Hicks, of Hatton Garden, is the maker.

SYR. HYPOPHOS. COMP. (FELLOWS).

THIS syrup was devised by Mr. Fellows, a Canadian chemist, as a combination of the hypophosphites with several bases, his object being to include in a single dose the medicines prescribed by his physicians for his own case. It comes to us strongly recommended by Canadian and American physicians, and possesses some points which, we think, will make it acceptable in this country. Thus the bases iron, quinine, and strychnine, well-known to be often useful in combination, are supplemented by manganese, calcium, and potassium. Manganese is an excellent adjunct to iron. Calcium and potassium, while supplying the wants of the economy, have been specially commended as bases for administration in the form of hypophosphites. The use of these salts has certainly increased of late years, and there are cases in which the combination with iron, quinine, and strychnine would seem to meet the indications. There is another point in this preparation which distinguishes it from others, viz., its slight alkaline reaction, which must make it frequently far preferable to the acid syrups which, in default of such a preparation as this, have been employed. No therapist now pretends that phosphoric acid is possessed of the properties attributed to the hypophosphites.

DAY'S NEW FEEDING BOTTLE.

THE Medical Officer to the Royal Hospital for Children and Women, Mr. E. Overman Day, seems prolific in ideas for the improvement of existing appliances. A few months since he contributed to our columns a new "Hip-joint Splint," which possessed decided merit. To day he sends us an improved feeding-bottle, which he has named the "Ne plus ultra." This bottle is made by Messrs. Edmunds, 31 Stamford Street, S. E., and is decidedly the most perfect feeding bottle we have seen. The entire contrivance is in two pieces only, i.e., the bottle and the tube; there is no cork or separate rim required; no corners in which milk can lodge and get sour in the hands of a careless nurse; no chance of a kink in the tubing; and no fear of illness to the child from decomposition, if the brushes which are supplied with the bottle are used for the purposes of cleansing.

MATHER'S PLASTERS.

MR. JOHN MATHER, the well-known manufacturing chemist, of Manchester, has brought the making of plasters to a pitch of perfection not yet attained by any other firm. Those sent to us by Mr. Mather possess in a high degree the regular smoothness and pliancy so much to be desired in surgical work, and all forms of the dressing are prepared and kept for use. The capsicum and belladonna plasters are most excellent applications, while the mustard plasters made by the same manufacturers will be found superior to most of those hitherto employed. These plasters, too, are porous, and are made in continuous lengths. They are, indeed, incomparably the best we have employed.

HEWLETT'S MIST. PEPSINÆ C. BISMUTH.

THE valuable properties of bismuth in many forms of dyspepsia are sufficiently well known, and Mr. Hewlett has done good service by perfecting a mixture containing in complete solution this body, together with liquor bismuthi, opium, hydrocyanic acid, and nuxvomica. The solution is perfectly mixable with water, and is not at all unpalatable to take. It has been employed with the best results in several cases of obstinate atonic dyspepsia, and should become a favourite remedy in the greater number of cases of gastric mischief. The dose is half a drachm to a drachm, and water alone is required to be added to produce a reliable and elegant medicine.

University of Oxford.—The following gentlemen passed the first M.B. examination at a meeting of the Examiners on July 1st:—

Chadwick, Chas. Montague, B.A., Oriol College and London Hospital. Dixey, F. A., B.A., Wadham College and University College Hospital. Ellison, W. A., B.A., University College and St. George's Hospital. Grosswell, A. B.A., Christ's Church and St. Bartholomew's Hosp. Growse, William, B.A., Pembroke College and Guy's Hospital. Korshay, J. E., B.A., University College and St. Thomas's Hospital. Peck, R. H., B.A., Exeter College and University College Hospital. Phillips, Francis Barclay, W., B.A., Balliol College and Guy's Hospital.

University of Dublin.—The following degrees were conferred last week by Earl Cairns, Chancellor of the University:—

Bachelor in Medicine.—Thos. Arthur Baldwin, Edward Cochrane, Thomas Donnelly, Thomas James Downes, William Solomon Elliott, Charles Gloster, Donald Grant, Thos. W. O'Hara Hamilton, Dawson Henry, Edward Gordon Hull, Achmuty Irwin, James Murray Irwin, Francis John Jencken, Thomas White Lewis, William C. Lucas, William Fennell M'Carthy, Alfred Miller, John W. Macquillan, Reginald Lawson Moseley, Thos. Myles, Augustus Nickson, Henry B. Pope, J. Allman Powell, Thomas Stauton, Jonas C. Stawell, Augustus W. Woodroffe.

Bachelor in Surgery.—Edward Cochrane, Thomas Donnelly, Wm. Solomon Elliott, Donald Grant, Charles Gloster, Thomas W. O'Hara Hamilton, Edward Gordon Hull, James Murray Irwin, Francis John Jencken, Wm. Fennell M'Carthy, John Macquillan, Alfred Miller, Thomas Myles, James Johnston Robinson.

Doctor in Medicine.—Wm. Hume Hart, John Charles Hogan, John Francis Houghton, Alfred Hubert Kelly, Achmuty Irwin (Honoris causa).

Master in Obstetrics.—Thomas Donnelly, James Murray Irwin.

Licentiate in Medicine.—Reginald Moore, Edw. Cuthbert Nangle, Ludovic Tarleton Young.

Licentiate in Surgery.—Reginald Moore, Edw. Cuthbert Nangle, Ludovic Tarleton Young.

Durham University Medical Graduates' Association.—The first annual meeting of the above Association was held in the Divinity Lecture Room of the University of Durham on the 28th ult., when a code of bye-laws was framed, and other business transacted. The members afterwards dined together

(by the kind permission of the Reverend, the Master of University College) at the High Table in the Hall of University College. The next annual meeting will be held in London. The following are the officers for the ensuing year, 1881-82:—

President: G. B. Philpott, M.A., M.D., F.R.C.P. *Vice-Presidents:* Luke Armstrong, M.D., W. Travers, M.D., F.R.C.S. Eng. *Council:* W. C. Arnison, M.D., H. T. Bowman, M.D., M.S., W. J. Tyson, M.D., F.R.C.S. Eng., Bedford Fenwick, M.D., Stodford Morton, M.D., W. S. Porter, M.B., D. Drummond, M.A., M.D., R. R. Wilson, M.D., J. R. Dodd, M.D., S. Feilden, M.D., G. P. Goldsmith, M.D., Hon. Sec. for the North and Treasurer, W. P. Mearns, M.B., Hon. Sec. for the South, H. R. Milson, M.D.

St. Andrew's Graduates' Association.—The 13th Anniversary Session of the Association was held at the house of the Medical Society of London on Wednesday, the 6th inst: The following gentlemen were elected officers and Council for the year ending June 30, 1882:—

President of Council: Dr. B. W. Richardson, F.R.S. *Treasurer:* Dr. Paul. *Secretary:* Dr. Leonard Sedgwick. *Council:* Dr. Holman, Mr. Menzies, Prof. Pettigrew, Drs. Seaton, Bransby Roberts, Christie, Cleveland, Dudfield, MacIntyre, Royston, Wiltshire, Cooper Rose, Falls, Mott Gramshaw, Semple, Samuel Hill, Dale, Kerahaw, Archibald Cholmely, Davey, Gordon, C. B., Stedman, Crosby, W. H. Day, Griffith, Wynn Williams, Alderson, Cassells, Corner, Lush, M.F., Rhys. Williams, Gillespie, Wilkinson, Longhurst and Henty.

Post-Office Reforms.—It is understood that a Bill will be introduced enabling the Post Office to begin next year with a sixpenny tariff for telegrams. It is also hoped to commence the system of delivering parcels by post next October. A stamp at the minimum rate of 6d. is to be issued, and parcels up to 4lbs. weight are to be accepted, the Post Office and the railways to share the amounts paid.

The British Association.—It has been resolved at a meeting of representatives of various educational institutions held in Birmingham, to invite the British Association to hold their annual meeting for 1883 in that town.

NOTICES TO CORRESPONDENTS.

✉ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

LOCAL REPORTS AND NEWS.—Correspondents desirous of drawing attention to these, are requested kindly to mark the newspapers when sending them to the Editor.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the *Medical Press and Circular*, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

DR. MILNER FOTHERGILL, DR. LANGDON DOWN, DR. NORMAN KERR.—Many thanks.

DR. K. (Rotherhithe).—We have not commented on the speech referred to in your letter because the meaning implied by the speaker, as demonstrated by gesture, tone of voice, &c., was probably very different to that which may be inferred from the newspaper report.

DR. MYRTLE (Harrogate).—Your "Notes on Gout" are marked for early insertion.

G. P.—No practitioner dispensing his own medicines is eligible as a candidate for the office of membership of the Council. It may seem hard that such should be the case, but either by the bye-laws, or by a clause in the Charter, such is prevented.

DR. STANLEY.—Yes, during the meeting of the International Medical Congress in August.

MR. J. HOOPER.—There is an interesting article in the last number of *Brain* "On Allochiria," by Dr. Obersteiner, which will probably afford some clue to the peculiar case now under your observation.

MR. PLANT.—"As old as the hills," sorry we cannot devote space to so obvious a copy.

A LADY'S VIEW OF THE CONTAGIOUS DISEASES ACT.—A few days ago a lady called upon one of the leading physicians in London with the object of seeking his advice. After concluding her case, she plainly asked of him why medical men were so unanimously in favour of an Act to prevent the spread of syphilitic contagion, and she endeavoured to dissuade him from employing his influence in that direction. After some argument, she expressed the point which most troubled her mind, which was that should the danger of syphilitic infection be diminished she entertained fears lest her husband might be tempted to stray from the paths of virtue.

DR. RIDGE.—Too crowded for insertion in the present number. Hope to find space in our next.

L.R.C.P. is referred to the discussion and leading article "On Vaccination" in the present number.

A FELLOW OF THE COLLEGE.—The election at the College is referred to in our "Current Topics." Forty-nine voters plumped.

DR. J. K. E.—We intend to report fully both on the Sanitary Exhibition and the International Medical Congress.

UNION HOSPITALS AND THE ROYAL UNIVERSITY.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR.—Allow me to press on my *countrymen* to give effect to No. 2 and 3 of the Conference resolutions published in your issue of the 15th of June. I would also ask the standing committees (whose members it would be inconvenient to summon just now) to give in the names of those willing to go to London to give evidence before the Royal Commission on Medical Monopolies and generally in defence of provincial interests. The names will then be forwarded to the chairman for selection. I hope the great opening presented by the new College of Surgeons' regulations will be availed of by Union hospital men.

Casbel, July 6, 1881.

Yours truly,
THOS. LEFFAN.

Vacancies.

Hospital for Women, Soho Square, London.—House Physician. Salary, £75, with board. Applications to the Secretary before July 19.
Kennington Union, W.—Dispenser for the Workhouse Infirmary. Salary commencing at £130. Applications (forms to be obtained by letter) at the Offices of the Clerk to the Guardians before July 22.

Kilkenny Union, Tiscoffin Dispensary.—Medical Officer. Salary, £160, and £30 as Medical Officer of Health. Election, July 18.

North Stafford Infirmary, Stoke-on-Trent.—House Surgeon. Salary, £120. House Physician. Salary, £100. Each with board. Applications to the Secretary before August 17.

Somerset Lunatic Asylum.—Medical Superintendent. Salary, £500, with furnished residence. Applications to the Clerk at Wells, Somerset, endorsed "Superintendent Candidate," before July 25.
Stockton-upon-Tees Hospital.—House Surgeon (non-resident, doubly qualified). Salary, £200 per annum. Applications to the Secretary by August 9.

Appointments.

BROWN, M. L., M.B., Junior Assistant Medical Officer to Hayward's Health Asylum.

CHRISTIE, J. W. S., L.R.C.P. Ed., L.R.C.S. Ed., Assistant Medical Officer to the Leaveness Asylum, Walsford.

DE BERRY.—A. C. C., L.R.C.S.I., L.K.Q.C.P.I., House Surgeon to the Bourbridge Dispensary.

FIRTH, C. M.B., F.R.C.S.E., Medical Officer for the Eighth District of the Norwich Union.

GLASSER, —, M.D., House Surgeon of the Bolton Infirmary.

KELLAND, J., M.B., C.M., L.R.C.P. Ed., Medical Officer to the Alderbury Union.

LINT, F., L.R.C.P. Ed., M.R.C.S.E., Medical Officer for the East Woolwich District of the Woolwich Union.

LINDARD, S. R., M.R.C.S.E., Resident House Surgeon to the Darlington Hospital.

LLOYD, J., F.R.C.S.E., M.B., M.S., Casualty Surgeon to the Queen's Hospital, Birmingham.

MACKENZIE, J. G., L.R.C.P.L., M.R.C.S.E., Ophthalmic Surgeon to the Royal Free Hospital.

MASON, G., M.R.C.S.E., Medical Officer of Health for the Wisbech Urban Sanitary District.

MARSEY, W., L.R.C.P. Ed., M.R.C.S.E., Medical Officer for the Castle Donington District of the Shardlow Union.

MILLS, R. J., M.B., C.M., M.R.C.S.E., Medical Officer for the Second District of the Norwich Union.

OLIVER, J., M.B., House Surgeon to the Durham County Hospital.

PARKER, W. E., B.A., M.B., M.R.C.S.E., Assistant House Surgeon to the Northern Hospital, Liverpool.

PAUL, F. T., F.R.C.S.E., L.R.C.P.L., Honorary Surgeon to the Royal Southern Hospital, Liverpool.

SIMPSON, W. J. R., M.D., C.M., Medical Officer of Health for Aberdeen.

THOMAS, E. W., M.R.C.S.E., Medical Officer for the Bitton District of the Keynham Union.

WARD, G. S., L.R.C.P. Ed., L.R.C.S. Ed., Medical Officer, for the Fifth District of the Hertford Union.

WILLIAMS, J. A., M.B., C.M., House Physician to the London Hospital.

NAVY MEDICAL SERVICE.—The following have been gazetted Surgeons: Henry B. Guppy, to the *Lark*; James H. Beatty, to the *Isabella*; H. S. R. Sparrow, to the *Boscawen*; A. Kidd, to the *Dido*; O. P. Browne, to the *Fleet*.

Births.

BROWNBRIGG.—July 5, at Hill House, Gravesend, the wife of J. A. Brownrigg, M.D., of a daughter.

FERGUSON.—July 6, at St. Peter's, Jersey, the wife of Surgeon-Major E. P. Ferguson, A.M.D., of a son.

MEREDITH.—July 6, at 24 Week Street, Maidstone, the wife of John E. Meredith, M.D., of a daughter.

NEARY.—July 5, at 30 Holles Street, Dublin, the wife of Dr. E. J. Neary, Howth, of a daughter.

Deaths.

ALFORD.—July 5, at 61 Haverstock Hill, N.W., from injuries received on the Midland Railway, Stephen Shute Alford, F.R.C.S., aged 59.

BEALES.—July 8, at Conington, Georgiana, the wife of Robert Beales, M.D., J.P., aged 38.

BIDDLE.—July 2, at Addison House, Edmonton, Henry Cooper Biddle, M.R.C.S.E., aged 46.

JENKINS.—June 15, at Castle Green, Llanawel, E. Jenkins, L.R.C.P. Edn., L.R.C.S. Edn., L.S.A.L., aged 40.

FRATTON.—June 24, at Manchester, J. C. Fratton, M.D.

WHITTED.—June 25, at Twickenham, Middlesex, from typhitis, John Whitted, M.D. Edin., aged 23.

A COURSE OF LECTURES

ON

THE LAWS OF INHERITANCE IN RELATION TO DISEASE.

Delivered at the Royal College of Surgeons of England, June, 1881.

By PROF. JONATHAN HUTCHINSON, F.R.C.S.,

Senior Surgeon to the London Hospital; President of the Pathological Society of London, &c.

LECTURE V.

It has been already sufficiently explained how tendencies to disease become inherited according to the action of definite laws, and also that a particular malady may be hereditarily transmitted, and be apparent at the same time as others (and particularly intellectual) abnormalities show themselves; the facts bearing on this connection are such as to add weight to the belief that consanguineous marriages are no inconsiderable factor determinant of the total result. Certain diseases are transmitted with such unerring certainty that we cannot but be forcibly struck by the persistence with which they appear, even after one or more generations in direct descent escape, and frequently, too, without the manifestation of any other defect in the individual. The importance of remembering this in connection with the question of complex diseases is extreme, and it should be borne well in mind.

The future classifiers of diseases, it must be assumed, will be guided by causation rather than by external appearances, and the nosology of the succeeding generation will ascribe the foremost importance to *origin* when arranging diseases into groups. It must, of course, follow that very dissimilar diseases, in appearance, will be brought into close association with one another, as being related, and the task is one of the first magnitude to carry

out. It affords, however, a magnificent field of labour for the family physician, whose experience of large numbers of cases would open up a most extensive field of observation, wherein to study the application of laws previously familiarised to him; those, viz., which regulate the transmission of morbid tendencies or peculiarities through generations. The phenomena of conditional and unconditional inheritance, as insisted on by Dr. Adams, will likewise have an essential bearing on the conclusions arrived at in this inquiry. These terms have been well-chosen, the one implying the *certain* development of the characteristic symptoms of an inherited disease; the other expressing the dependence of its appearance on the existence of conditions affecting the susceptible individual, and favourable to the exhibition of the disease at some period or other during the existence of the former. Importance, moreover, attaches to the manner in which inherited tendencies combine with other affections subsequently produced, the degree of influence thus exerted being capable of variations within very wide limits. Lastly, the classifier of diseases must carefully estimate the modification of heritable qualities set up by conditions to which the subject of them is submitted in after life.

The individual is liable to be diseased from three separate sources, viz.: (1) directly, from germ to germ; (2) from the effect of influences *in utero*; and (3) from independent causes operating after birth.

In a former lecture single family prevalence was explained as being due to the inheritance of peculiarities of which no account had been preserved, but, as has been already hinted, there may be a law, hitherto undiscovered, by the action of which such occurrences are brought about. Else is it all but impossible to understand how, as in a family of which four out of eight members were born with exactly the same form of idiocy, and which possessed no record of either inherited tendency to intellectual aberration or of consanguineous marriage, some marked disease appears in the same form in several members of a family. Heredity may be safely considered to be secured when in several generations there has been a steady increase of the diseased state, the repetition serving to fix its characters, and to enable it to prevail independently of external con-

ditions. This becomes an unconditional inheritance. The strength of the tendency can be gauged by the period of its exhibition, being strong when apparent during infantile or intra-uterine existence, and progressively weaker as its development is seen to be dependent on circumstances apart from it.

The chilblain diathesis referred to in the last lecture is very commonly inherited, and it is highly necessary to appreciate the importance it has in relation with other maladies it is so frequently associated with. Similarly with the catarrhal diathesis, by which is meant a tendency to excessive secretion from an internal mucous membrane, due to a reflex irritation. This is a usually spontaneously terminable complaint, the phenomena of which admit of explanation, as being of nervous origin.

A common cold may be taken as the type of a large family of widely spread affection. The term "catarrhal," however, ought to be rigidly restricted to this class of diseases, and not, as is improperly done at present, be indiscriminately applied to any mucous and purulent discharge, the name being a misnomer when used to describe the latter kind of inflammation, as, e.g., in so-called catarrh of the bladder, &c.

Rheumatism.—In subjects of the rheumatic diathesis there is a constant tendency to "catch cold" in the joints, this being the primary symptom of the disease. Acid sweating, &c., are results secondary to the cold, and consequent on it, exposure sufficing to bring the latter about. There is a natural termination to this, spontaneous cure being the normal sequel, but we may encounter chronic rheumatism in the same way that we meet chronic catarrh, and the tendency to rheumatism may be seriously complicated by the existence of other diseased condition.

Gout is very difficult to define, or to explain satisfactorily in accordance with the laws of inheritance. Its peculiarity may best be described as an unhealthy condition of the blood due to accumulation in it of uric acid and of salts; probably, too, in gouty patients, there is some kidney affection advancing gradually to definite disease of that organ, and with this and the increased tension endured through it in the arteries they undergo structural changes; indeed, it may be said that all the tissues of the gouty subject undergo changes which result in their being variously modified, all being of necessity influenced by the condition of the blood circulating through them. They are likewise considerably influenced by the inherited tendency to gout transmitted, as this assuredly is, from generation to generation; and on such persons as are thus affected cold immediately acts as a test of their condition, and through the effects it produces will demonstrate which tissues of the body are most susceptible or most changed. Gout, in fact, is concerned with all the structures, showing preference for none in particular, and the most certain and useful information about it we can hope to obtain will be that gained from a study of its origin; that is how it has been primarily induced. This inquiry would lead to the conclusion that it has been gradually bred in past generations, and by the action of the same causes as are in this present time serving to intensify it. In fact, gout is now being bred amongst us by the perpetration of errors in diet, &c.; but it is a difficult matter, nevertheless, to initiate it in those who possess no inherited tendency to the disease, and it requires to be perpetuated through several generations in order to acquire a high degree of potency. That gout, however, is hereditary is unquestioned, and thus we have in it a disease acquired originally by indiscretions in diet, and attaining powers which ensure its transmission to succeeding generations. As has been seen, diatheses are influenced by conditions obtaining during the life of the individual, and are modified by other diatheses. Hence, the probable result of intermarriage of a rheumatic person with one in whom gout had developed, would be a hybrid affection exhibiting the phenomena of both gout and rheumatism, and thus the term "rheumatic gout" is quite justified. It is, moreover, a term which ought

properly to be applied to a large number of so-called gouty subjects, and when there is this occurrence of disease possessing the twofold characteristics, there has undoubtedly been a transmutation of diathesis during transmission.

Hæmophilia is remotely allied with gout, but the view that it is so is opposed by Dr. Legge, notwithstanding that some of his own cases, as quoted by him, tend to support the assumption that hæmophilia is a direct but distant ancestor of gout, thus showing how the tendency to disease of a particular tissue (arterial in this case) will persist from generation to generation. A previous example of the same phenomenon was given in retinitis pigmentosa.

"Transmutation in transmission" is well shown in a case described in Mr. Hutchinson's lectures, delivered in 1880, on Gout, in which the patient was the subject of articular disease of the phalanges, the distal bone undergoing destruction. After existing for ten years, the affection subsided so far that inflammation in the finger disappeared, but *iritis* developed itself, and progressed to such an extent that one eye was entirely destroyed, so far as sight was concerned, and the fellow organ was much impaired. In this case the patient was young, the location of the disease was determined by cold, and there was little doubt that he inherited a gouty tendency. There are several cases, moreover, on record, of destructive iritis, so similar to it in detail, and many with the history of inherited gout, that they warranted the conclusion already drawn in support of transmutation in transmission.

Leprosy is very closely comparable, as a diathesis, with gout. It is a heritable disease, and in the opinion of Mr. Hutchinson is primarily due to two acting causes, viz., inheritance and fish-diet, the older authors testifying to the truth of this conviction. It will be at once remarked, that the dietetic origin of the malady bears strict relation with the preponderating cause of gout, and in many respects there is a wonderful similitude between the two diseases. The contagiousness of leprosy, which has been often insisted on, cannot be said to be clearly shown, but in those districts where leprosy persons form a considerable number of inhabitants, it is commonly incurred. The same may be predicted of gout itself; and of both maladies the distinctive symptoms are, definite but slow progress; constitutional affection of a non-contagious character; and possibility of cure by rigid exclusion of articles of diet favouring the tendency to disease, together with entire alteration of the conditions amid which it develops. Since leprosy is capable of initiation, *de novo*, by undue indulgence in fish food, and avoided by abstinence from it, we cannot obtain any definite aid in determining the causes of its production through consideration of the law of atavism. Thus a leprosy person may have had parents entirely free from the disease, while the grand parents were afflicted with it; or in other ways its production is capable of explanation without invoking the data of inheritance. Moreover, the tendency to transmission of leprosy is not a strong factor, for we find that Norwegian emigrants in whom it has been developed do not necessarily transmit it to their offspring, when separated from the localities in which they were surrounded by conditions favourable to the existence of the affection.

Cancer. The popular opinion to the effect that this distressing disease is always transmitted to the offspring of cancerous individuals is not supported by the conclusions arrived at by those who, like Sir James Paget, Mr. Birkett, Mr. Marrant Baker, and others have specially investigated this question. Indeed it has been shown that only one out of every six cases is due to direct inheritance, and we should be led to anticipate this from the knowledge we possess that cancer (including under this head all forms of malignant new growth) is a disease of old age especially; and it has been already conclusively demonstrated, that the more certainly transmissible complaints are such as occur in early life, those of advanced age being among the more rarely inherited forms.

PROPHYLAXIS OF RABIES AND HYDRO-PHOBIA. (a)

By THOMAS M. DOLAN, F.R.C.S. Ed.,
Halifax, Yorkshire.

(Continued from page 25.)

I SHALL consider preventive measures under two heads.

1. As influenced by individual actions.

2. By general action, both being set in motion by some central machinery or driving power.

By individual action I mean the concurrence of dog owners which may be compassed in many ways.

a. By making dog owners feel the responsibility resting upon them from the possession of a dog, a responsibility which entails duties not only to the animal, but to society. A dog should be well cared for, well fed, have proper nourishment, be supplied with water, kept clean, or in other words be hygienically treated, so that it is evident the animal will gain by my measures. Society will be protected by the enforcement of this responsibility, and by the extra care bestowed on the canine race.

b. By popularising a true knowledge of the symptoms of rabies amongst dog owners, so that they may either at once recognise the disease, or if their dogs seem unwell, have recourse to a veterinary surgeon or to the police.

I shall thus again secure for the dog extra supervision. In the *Medical Press and Circular Reports*, 1877, the following passage occurs, suggesting an easy method of diffusing such knowledge:—

“Dog owners, when they receive their tax-papers should be provided with printed and easily understood instructions as to the proper method of keeping their dogs healthy, and how to detect the symptoms of rabies. They will thus be informed of the preservative and sanitary police measures, which they should comply with, in order to prevent the disease. All this might be printed on the back of the tax-paper, which could, in addition, be made a valuable means of arriving at certain important information, such as the age, sex, breed of the licensed dog.”

In the *Union Medicale*, July 6th, 1878, p. 27, Bouley says on the same point:—

“Such a description popularised, would be of the greatest efficacy against contagion. I have often seen the contagion transmitted by small house pets, whose condition at the commencement of the malady did not inspire any distrust in persons ignorant of the first symptoms.”

It would also be well to vulgarise the best methods of treating dog bites, whether inflicted by animals rabid or not.

c. By insisting on each dog being furnished with a collar with the name and address of the owner legibly stamped thereon.

d. At certain periods, when rabies may be imminent, dog owners should muzzle their favourites, or when exercising them, lead them by a string.

e. By the spread of information about dogs and their value, their proprietors would be taught how to treat them with one regard to their habits and wants.

With pain I have often seen a large retriever or mastiff in a house where the animals have scarcely had room to turn, and where exercise has been almost out of the question. Again I have noticed water dogs in the possession of families living miles away from a running stream or a supply of water, where the animals could indulge in their favourite pleasure, or almost element.

Mongrels, curs, and other animals, which are allowed the range of the streets to obtain their own living are really deserving of our sympathy.

In the densely populated towns of Lancashire and Yorkshire, this class of dog abounds, and we have an explanation of the cause, why Lancashire and Yorkshire enjoy such an unenviable prominence in the mortality from hydrophobia.

(a) Paper read before the British Medical Association at Cambridge.

The working man has a right to love and possess a dog; but dogs are luxuries; those who cannot afford to keep them, and those who are too negligent to take care of them should not keep them.

By all means let every one have a dog; but let him select a good and pure breed, and let him take proper care of it, with a full sense of his own responsibility, and with fines and penalties in the background, so that he may not forget it, for, as so well expressed in the *Medical Press and Circular Reports*, p. 209, “Fines and penalties would affect the dog owners’ pecuniary interest, unfortunately so much more powerful than those of a sanitary character, for they thus learn, in the words of M. Bouley, ‘That the fear of a diseased dog is not only the beginning of wisdom, but wisdom itself.’”

f. Dog owners should be bound to report to the police the absence or straying of their dogs, or the outbreak of rabies amongst them.

g. Penalties should be enforced for exciting or otherwise ill-treating a dog.

h. The dog tax should be increased.

I hope for good results from individual action, especially when this is supplemented by united action. United action will be secured by general action applicable to the whole of England, to be carried out by the various local authorities acting under central direction, so that at any time, and by one general order, the whole machinery for the purpose in England would be set in motion, and the same action would be taken, and the same measures adopted, by all the local authorities at the same time. We have now permissive legislation; we must substitute for that compulsory legislation.

The Dog Act, 24th July, 1871, is very imperfect; for instance, under the first clause the police may sell or destroy the dogs detained by them. They may thus assist in spreading the very disease they are striving to eradicate, by selling a dog with rabies in its incubatory or latent stage. This dog may be carried miles away to form there a fresh focus or centre for contagion. It is contagion we have to contend against, and we cannot make war against contagion with rose-water. I do not desire to carry on a crusade against dogs, as some pseudo-humanitarians imagine.

We must not allow a false humanity to stand in the way of legislation. Let there be tears for the dog, but let there also be tears and compassion for the victims of dog disease, and for the thousands who lead a life of fear and apprehension in consequence of dog bites.

I am really the true friend of the dog; my legislative measures will tend to increase the dog’s value and happiness; will ensure for him better provision, and his life in the future will be almost undisturbed by the extinction of the disease, which has been such a stigma to his race, and which has caused such widespread misery, not only amongst the canine, but the human, species.

Another fault in the Dog Act is, that the local authorities act independently one of another; thus, though restrictions may be placed upon dogs in Preston, yet there may be no restrictions upon dogs immediately outside the jurisdiction of the Preston authorities. We sin, not through lack of knowledge, but through our apathy in not applying the information we possess.

A short Act, such as I propose, would speedily check the disease, and I believe it can hardly admit of argument that such an Act is needed in justice to mankind, and in justice to the dog:—

PROPOSED ACT.

WHEREAS it is expedient that further protection should be provided against dogs.

Be it enacted by, and with the advice and consent of, in this present assembled, and by the authority of the same as follows:—

I.—From and after the passing of this Act any police officer or constable may take possession of any dog that he has reason to suppose to be savage or dangerous, straying on any highway, and not under the control of any

person, and may detain such dog until the owner has been found or claimed the same, and paid all expenses incurred by reason of such detention.

The owner of such dog, taken possession of by any constable, shall be informed by letter, stating the fact of such dog having been taken possession of, at his usual or last known place of abode.

When any dog taken in pursuance of this Act has been detained for three clear days, where the owner cannot be found, as aforesaid, or for five clear days where he is so known without the owner claiming the same, and paying expenses incurred by its detention, the chief officer of police of the district in which the dog was found shall cause such dog to be destroyed.

The owner shall be summoned, and be liable to a penalty not exceeding £3, and pay all expenses. All dogs detained under this section shall be properly fed and maintained at the expense of the local rate.

II.—Any court of summary jurisdiction may take cognisance of a complaint that a dog is dangerous, and not kept under proper control; and if it appears to the court having cognisance of such complaint, that the dog is dangerous, the court may make an order in a summary way directing the dog to be destroyed, and any person failing to comply with this order, shall be liable to a penalty not exceeding twenty shillings for every day during which he failed to comply with such order.

III.—In order to assist the police in establishing ownerships, all dogs shall wear a collar with the name and address of the owner legibly stamped thereon, and such collar shall be a proof of ownership.

Any dog found wandering without a collar shall be seized and detained by the police. If unowned it shall be destroyed after three days' detention, and should the owner be found, the dog, if healthy, shall be restored on payment of expenses, and a penalty not exceeding £5.

IV.—The local authorities shall, if a mad dog, or a dog suspected of being mad, is found within their jurisdiction, issue, and when made revoke, an order placing restrictions on all dogs during such period as may be prescribed in such order throughout the whole of their jurisdiction as follows: (1) All dogs shall wear a properly-constructed muzzle, or be led by a string, during such period as order may direct. Any person failing to comply with such order shall be liable to a penalty not exceeding twenty shillings. (2) Any dog found wandering by the police without a muzzle shall be at once seized and detained, the owner of such animal to be liable to a penalty not exceeding twenty shillings. (3) One notice of such order shall be published at the expense of the local rate.

The provisions in this Act contained as to the detention and destruction of dogs found at large in contravention of any order made in pursuance of this section.

V.—The local authorities shall assist and combine in any general action taken by other local authorities to restrict the spread of rabies, even though the malady may not be present, and in the jurisdiction of such authority, such general order will be announced from the Privy Council, and published in the *Gazette*.

VI.—All dog owners shall report to the police the occurrence of rabies amongst any animal they may possess, either dog, cat, horse, or cow, under a penalty not exceeding twenty shillings within twenty-four hours.

VII.—Dogs owners shall be responsible and liable for any damage done by their dogs, owing to their own imprudence or negligence.

VIII.—Dog owners shall report to the police the absence, straying, or loss of their dogs, under a penalty not exceeding twenty shillings.

IX.—Any person wilfully exciting a dog, or otherwise irritating it, shall be liable to a penalty not exceeding three months' imprisonment.

X.—A register shall be kept at all police stations of all dogs destroyed, either for rabies, or by order of a chief constable, or of a court of summary jurisdiction, and a return of the number of dogs destroyed shall be published annually, specifying reasons for destruction as aforesaid.

XI.—On application from a veterinary school of medicine, or from a veterinary surgeon, or any legally qualified medical practitioner, the police shall hand over any bodies of dead animals they may possess for dissection; but a guarantee must be given that the body is required for that purpose, and that when done with, the remains shall be burnt.

XII.—The bodies of all dogs destroyed by the police shall be burnt.

It may be objected against this act, that the penalties are too high, and that it puts too much power in the hands of the police; but to these objections I can only reply that it is only by high penalties we can ensure protection for the dog and the public, and as regards the police, I know of no more suitable or trustworthy men for the task. The police are interested in the subject already, and through the courtesy of the various chief constables, I have been able to collect some useful statistics as to the prevalence of rabies in all parts of England. The West Riding of Yorkshire figures painfully in the mortality from hydrophobia during the years 1870 to 1877.

By means of the police returns I have been able to draw up some valuable returns, and if all the chief constables in England had furnished me with such accurate and voluminous returns as those kindly supplied by Captain Stuart Russel I should have been able to present you with a table showing the number of suspected and rabid dogs destroyed in England during the years 1870 to 1877. In conclusion, I must say a few words about hydrophobia. As we know, it is a specific disease depending upon rabies in animals, so that if we eradicate or prevent it in the lower species we protect the higher.

As regards preservative measures after bites, I think we should return to the practice of Paulus Aegineta and encourage bleeding, so that when a patient comes to us with a dog bite it would be well to incise the wound, use suction of some kind to encourage the flow of blood, and then cauterize the wound.

In the *Lancet* and *British Medical Journal* of 1880, I have more fully developed this idea, so that I need not waste your time by repeating my already published observations.

These suggestions I offer in the words of the old Latin poet, and must conclude in his words:—

“ Rectius istis candidus imperti,
Si quid novisti,
Si non his utere mecum.”

Clinical Records.

SOME CASES IN HOSPITAL PRACTICE.

Under the care of Professor McNAUGHTON JONES,
Surgeon, Cork County Hospital, &c., &c.

CASE I.—*Caries of Tarsal Bones—Removal of Greater Part of Os Calcis, Outer Malleolus, Head of Astragalus, and Cuboid Bones.*—These bones were removed on May 27th. Esmarch's bandage was used; the operation was bloodless. On removal of the elastic bandage there was very severe hæmorrhage from the cavity of the os calcis; finally this had to be plugged to stop the bleeding. The operation was performed under spray with antiseptic precautions. The plugging interfered with the result, but the patient has done well. In an operation of excision of the wrist (Lister's) not long since, Prof. Lister found the same result after the use of Esmarch's bandage—severe hæmorrhage from the bone-ends, which resisted all efforts to stop it until the canals were plugged with small wooden plugs.

CASE II.—*Lacerated Wound of Hand; Outer Third of Palm torn off—Forefinger torn off—2nd and 3rd Metacarpal Bones Fractured and Luxated—Severe Hæmorrhage.*—Prof. Jones saw the case two hours after the receipt of the injury. The hand had a horribly mangled appear-

ance, the result of the explosion of a gun-barrel. There was severe hæmorrhage. Under ether he removed the forefinger, and the second and third metacarpal bones; fashioned the hand, covering the exposed parts; the entire being thoroughly antisepticated, and the dressing conducted under spray. Any bleeding vessels were twisted, and, after considerable trouble in transplanting, the skin was brought together, and the torn tendons were removed. On April 17th the patient complained of tightness of the chest, pain in the back and in the epigastrium; his countenance wore an anxious expression; altogether he appeared as if threatened with some tetanic symptoms. The next day these increased, and continued for one week, when they subsided and the patient lapsed into a drowsy condition. During all this time he was kept on chloral and bromide of potassium, with tobacco infusion, applied under a light carbolic poultice to the hand. On April 17th an erysipelatous blush appeared on the forearm, and spread to the arm. This was treated with oleste of mercury and morphia dressing. Finally all the symptoms disappeared. He left hospital on May 28th, and the hand is now quite restored, all the wounds having healed. There was no doubt that the patient was threatened with tetanus, and that the symptoms were held in abeyance by the treatment.

CASE III.—*Ovariectomy. — Operation; Recovery.*—N. O., æt. 18, unmarried; tumour growing from left ovary for over twelve months; measured thirty-nine inches round umbilicus on admission to hospital. Operated on June 29th, under bichloride of methylene. No adhesions. Usual steps carried out. Hardly any blood lost. A few peritoneal vessels ligatured with silk-worm gut; pedicle tied, looped, and dropped back; no hæmorrhage; not a bad symptom, and recovery perfect on tenth day. Twenty-three pints of fluid in cyst. This case is interesting as being the first successful case of hospital ovariectomy performed in Cork.

CASE IV.—*Extraordinary Accumulation of Pus in Peritoneal Cavity; Cured by Incision and Drainage.*—J. C., æt. 32. Admitted as a case of ovarian tumour, ten weeks after labour; history of pelvic peritonitis after delivery. On careful exploration Prof. Jones expressed a doubt as to the tumours being ovarian. The history of pain and enlargement commenced a week after confinement. There was enormous distension on admission, April 15th. The patient was aspirated on the 16th, and nine pints of pus drawn from the peritoneal cavity. This quickly re-secreted, and on May 2nd five pints more were taken to relieve the sense of hyper-distension, and consequent uneasiness. On May 13th the abdomen was opened antiseptically; all the pus evacuated through an incision of about two and a-half inches. The peritoneum was greatly thickened; it was hooked carefully up and held in contact with the abdominal parietes; then a Keith's glass drainage tube was passed, and held in position in the wound by sutures; the peritoneum was stitched from within out to the abdominal wall and secured; a drainage tube with a wire coil inside was attached to the glass tube, its other end resting in a bucket of carbolic water (10 p.c.) placed at the side of the bed. The pus drained into this, no air being permitted to enter, for nearly three weeks. The glass tube was taken out each day, and the wound dressed under spray after the first week, the orifice being carefully cleansed, and the rubber tube well washed out with carbolic solution every day, the end being corked under the carbolic water whenever the latter had to be changed. Suffice it to say that the patient has lost, at the lowest calculation, some thirty pints of pus since she came into hospital. For the last five weeks the opening has been kept patent to secure drainage by a bunch of horsehair carried well into the cavity. All the pus is gradually disappearing. A hard pelvic mass filling the brim remained after the removal of the pus, but this has also disappeared, having evidently broken down since the opening was made. There are many interesting points about this most interesting case, but the above facts are sufficient

for the present to record its occurrence. The woman is now quite strong and well, has a good appetite, and is only anxious to leave hospital. All through the case has been treated antiseptically.

CASE V.—*Curious Case of Compound Fracture of the Humerus at Both Extremities by "Contre coup," with Compound Fracture at Elbow-joint.*—The patient, a woman, æt. 54, was brought into hospital on January 26th. She had a portion of the humerus protruding immediately above the olecranon fossa, and an ugly, jagged wound of about one inch in length at this spot. On examination it was clear that there was a supra-condyloid fracture of the humerus; at the same time the shoulder-joint was found greatly swollen, and the bone had also evidently been badly broken, it being difficult to say, from the great swelling, the exact nature of the injury. The woman had fallen, in the frosty weather, downstairs, some three or four steps, saving herself by her elbow. The limb was put up by Prof. Jones in immovable apparatus, the protruding piece of humerus, which was quite loose, having been removed, and the wound washed with a strong carbolic solution (1 in 20). A firm cap was placed over the shoulder, and all secured with angular splints and tripolith, the wound itself having first been closed with protective and antiseptic dressing. It healed quickly; no supuration. On the final removal of the fixed dressing there was found at the upper end of the humerus just beneath the coracoid process a loose portion of bone under the skin. It was at first difficult to say what this was. The problem, however, was solved when, under ether, the detached portion was removed, and found to be the outer half of the bicipital groove of the humerus for the extent of about two inches, with the adjoining bone. The cephalic vein was torn in its removal, but the hæmorrhage was easily controlled by two ligatures. This is a unique case of fracture—fracture of both extremities of a long bone, with separation (longitudinally) of a portion of both ends, and a compound fracture accompanying.

(To be continued.)

Department of Lunacy.

LUNATIC ASYLUMS IN NEW ZEALAND.

IN New Zealand, as in this country, as regards lunatics the cry is "Still they come!" Year by year since 1873, when Dr. Frederick Skæ, the able and successful Commissioner in Lunacy for the colony, first obtained trustworthy statistical data, there has been a progressive increase in the number of the registered insane, the increment for that year having been 55, and for 1879 101. As the proportion of the insane to the estimated general population in New Zealand is now (Maories excluded) 1 in every 445 persons, it is evident that the increase in the number of lunatics has been out of all proportion to the expansion of population. As immigrants are generally a hardy set of people, robust in mind as well as in body, and as they do not carry with them to the Antipodes any members of their families who are in a state of mental dilapidation, it is difficult to understand why the propagation of mental diseases in New Zealand should be as rapid as it is, unless we attribute it to the excitement and trials which are incident to a new start in life, and to the intemperance which so often prevails extensively in new settlements. Dr. Skæ wisely refrains from committing himself to any theory as to the nature and origin of the increase in the number of lunatics whom he has to supervise, and contents himself by pointing out that some time must still elapse before the burden of lunacy in New Zealand becomes as grievous as it is in the mother

country. The proportion of lunatics to the population in New Zealand is, as we have said, 1 in 445; whereas, in England, it is 1 in 360, and in Scotland 1 in 392. The table of the causes of insanity in the cases coming under observation appended to Dr. Skae's report gives countenance to our supposition as to the sources of the increase of lunacy, for there it appears that in 84 out of 399 cases in which the cause of the mental overthrow was ascertained, intemperance, alone or in combination with other morbid agencies, such as hereditary predisposition, sexual excesses, or domestic calamities, was responsible for the disease, while in a large proportion of cases emigration, disappointment, troubles, solitude, bereavements, anxiety, exposure, and other conditions likely to be connected with a struggle for existence in a new land, are set down as the starting points of the insanity.

One satisfactory feature in Dr. Skae's report is the evidence afforded by it that the large majority of patients admitted to asylums in New Zealand are of the most curable class; that is to say, they have not previously been insane, and their disease has not lasted more than three months at the date of their admission. Comparatively few belong to the least promising class, consisting of those who have suffered one or more previous attacks, and have been insane for more than a year at the time when asylum treatment is resorted to.

The asylums of New Zealand are eight in number, and contained at the end of 1879 1,056 lunatics—695 males, and 361 females. The largest of them is the asylum at Dunedin, which contains upwards of 300 patients; and the smallest is that at Napier, which contains under twenty. All of them are overcrowded. They, together, contained, at the beginning of last year, 259 patients over the number they were calculated to contain, and must therefore have been encumbered to a most inconvenient degree, if not to such an extent as to endanger the health of their inmates. This highly condemnable state of affairs will be remedied shortly by the opening of new wings, now in process of construction, at the Wellington Asylum for 50 patients, at the Auckland Asylum for 107, at the Christchurch Asylum for 100, and at the Otago Asylum for 300. But although the additions thus in progress will relieve immediate pressure, and meet the requirements of the colony for about three years if lunacy does not hasten its rate of increase in an unprecedented manner, they will not obviate the necessity for the erection of further new buildings on a large scale. The buildings now in use at Dunedin, Wellington, and Napier are altogether unsuitable for their purpose, and must be relinquished at no distant date, some of them being mere temporary sheds, never intended for permanent occupation. The colony ought certainly, when it is about it, to provide, in place of the buildings which must be abandoned, lunatic hospitals of an approved type, replete with all modern appliances for the treatment of the insane, and of dimensions such as to render all clobbering, crowding, or enlargement unnecessary for a dozen years to come. Makeshifts are not economical, and the wisest plan is to provide beforehand for an inevitable increment of lunatics in a complete and efficient manner. The best advice and guidance are at the command of the colony, which possesses an eminently practical commissioner in Dr. Skae, and some pride should be felt in creating hospitals for the insane which shall vie with those of Europe, and supply to the afflicted beings to be consigned to them all the comforts and alleviations, and prospects of recovery to which their pitiable condition entitles them. The new asylums, and,

indeed, all the asylums in New Zealand, should be placed forthwith under the care of competent medical superintendents, as that is the only sure way of effecting the reforms which are urgently needed in them. Medical men with the necessary experience in the treatment of mental disease, and of asylum administration, are not likely to be met with in New Zealand, and ought therefore to be procured from England. There are many thoroughly well qualified assistant medical officers in English asylums who, for £600 or £700 a-year, would be willing to emigrate to New Zealand, and undertake the responsible charge of the asylums there. It is monstrous that an asylum like that at Dunedin, containing upwards of 300 patients, should be left without a resident medical officer. "No one," says Dr. Skae, "can shut his eyes to the absurdity of 300 diseased brains being under the charge of anyone but a resident physician." At the Christchurch Asylum a resident medical superintendent has been appointed, the services of Mr. Bacon, formerly assistant in the Warwick County Asylum, in this country, having been secured. It is earnestly to be trusted that the Government will, without further delay, extend a similar advantage to the other asylums of New Zealand, or, at least, to the three largest of them.

The total expenditure on the management and maintenance of the insane in New Zealand for 1879 was £35,360. The average cost of maintenance per head was £33 9s. 10d., or, deducting sales and repayments, £29 10s. 6½d., which must be pronounced a very modest sum when the wages paid to nurses and attendants in that colony are kept in view. At Wellington attendants receive £147 per annum with rations, and nurses £50 per annum with rations also. The lowest wages paid at any asylum in New Zealand is at Auckland, where attendants receive £60 and nurses £42 per annum, with board and washing.

CHAPTER II.

Syncope and Asphyxia, Thrombosis and Cardiac, and Pulmonary embolism.

Besides congestion and acute œdema of the lung with or without albuminous expectoration, the medianism of which we have just studied, and the lesions of which have been frequently noted post-mortem, there exists another series of accidents more indirectly associated with paracentesis, and not so intimately connected with it; liabilities,—on the one part of syncope with or without cardiac lesion, on the other of asphyxia with or without thrombosis and embolism of pulmonary vessels. The following is a "résumé" of some cases bearing upon this species of accident.

No. 1. (Trousseau and Pidoux). Left pleurisy in a gouty subject; Trousseau let out 4½ pints of serum. The patient broke the rules and got up several times, and in trying to return to bed, died of syncope 24 hours after the operation.

No. 2 (Goyuel). Patient with left pleurisy, pericarditis, orthopnea, cyanosis, and extreme debility. Two and a half pints of fluid withdrawn—patient after two attacks of fainting, finally carried off by syncope. At the autopsy 2½ pints of fluid found in the pleura, and pericarditis.

No. 3 (Chaillon). A woman six weeks after confinement, with left pleurisy, and shortly after seized with venous

thrombosis of face. The operation gave vent to 2½ pints of fluid, with immediate benefit; but next day the patient died suddenly.

No. 4 (Besnier). A patient with right pleurisy, pain excessive, extreme weakness, and malignant symptoms from the first. Paracentesis decided upon, and the operation performed with every precaution. The puncture gave issue to 9 or 10 oz. of horribly foetid sanious fluid, indicating gangrene of pleura. The patient died of pleurisy while the operation was proceeding.

No. 5 (Legroux). Left pleurisy with great effusion—excessive dyspnoea and commencing cyanoea. Three and a half pints of fluid withdrawn. The patient was seized with cough and brought up some white and pink sputa. Three quarters of an hour afterwards he died.

No. 6 (Vallin). A patient with pleurisy and considerable effusion. Five pints of purulent fluid withdrawn. The operation was well borne, and the patient died suddenly twenty-four hours afterwards.

No. 7 (Guyot). Left pleurisy—6 pints of fluid withdrawn. Patient died three days afterwards of syncope. At the autopsy a fatty heart and a clot in the pulmonary artery were found.

No. 8 (Vergely). Case of pleuro-pneumonia. The pleurisy became purulent. General condition very grave, pulse intermittent. Cardiac clots dreaded. Paracentesis gave vent to about 1½ pints of pus. Half an hour afterwards patient died suddenly. At the autopsy cardiac clots were found which had been diagnosed during life.

I could multiply these cases, but it is unnecessary. I determined to group in this second category the accidents which differ from those of acute pulmonary oedema, and of albuminous expectoration, because they have a different origin, and their relations with paracentesis have nothing in common. The pulmonary oedema and albuminous expectoration following paracentesis, which I included in the first list, all resemble each other, save in their intensity; they are simple, grave, or fatal; but the conditions of their etiology are identical; they present themselves under the same aspect; they follow paracentesis closely; they are directly provoked by it, and thanks to the precautions given above, happily they may be avoided. The accidents of the second group are of a very different nature: in these cases the pleurisy is often complicated; some are purulent, others accompanied by pericarditis, gangrene of pleura, cardiac clots, thrombosis of pulmonary artery; death supervening sometimes after the operation, sometimes the next day, and even three days after. We wish to know how far paracentesis is responsible for these drawbacks. As regards the first group (acute oedema and pulmonary expectoration) paracentesis was evidently the cause of the symptoms. But how far is it responsible for the other accidents? A perusal of the very remarkable case of Dr. Vergely (No. 8), and the judicious observations accompanying it, shows that the cardiac clots were diagnosed during life, and that every precaution had been taken to prevent failure; so that death followed as a consequence of the existence of the cardiac clots, and not as a consequence of the operation. In case No. 7 of Dr. Guyot, the patient did not die until the third day after the operation, and at the post-mortem examination fatty degeneration of the heart was found, with a clot in the pulmonary artery. Must the operation be accused of this? Certainly not. In case 3 of Dr. Chaillon, it is said that the patient, six weeks after confinement, had thrombosis of the veins of the face; and although no autopsy was made, is it not probable that death, which followed twenty-four hours after the operation, was caused by a thrombosis or embolism of the pulmonary vessels? Here are, therefore, very analogous, if not identical facts, proving that clots in the heart and pulmonary vessels may lead to death by syncope or rapid asphyxia, at periods more or less remote from the operation; and on the other hand it has just been shown, while studying the causes of sudden death in the course of pleurisy, that this fatal termination is often due to the formation of pulmonary or cardiac clots (Vallin, Blachez, Vergely), clots which may in their turn become a source of cerebral embolism and of hemiplegia, so that the pathology of these accidents is the same in both cases, whether paracentesis has been performed or not; and it may even be questioned whether performed earlier, it might not have diminished the risk of formation of clots and thus lessened the danger.

Nevertheless, this question has been raised. As para-

centesis permits the return of the circulation to vessels which have been deprived of it, if these vessels are the seat of thrombosis might not the clot be transformed into an embolism by the sudden return of the circulation? I am aware of no facts on which such a theory could be based.

The other cases, notably those of Drs. Besnier and Legroux, gave rise to interesting discussions at the Medical Society of Hospitals. Dr. Legroux's patient had frothy sputa and pulmonary congestion, which symptoms resemble those in the first group of accidents, I consider with those of Dr. Desnos who reports the case, that it is not the operation—the aspiration which can be assigned as their cause, any more than it can be in Dr. Besnier's, in which the patient had gangrene of the pleura, and who exhibited from the first debility, prostration, and "other symptoms of malignity."

What conclusions may be drawn from this discussion? That paracentesis performed in certain abnormal pleurisies, occasionally gives rise to grave accidents; that there are complications, as cardiac clots, old adhesions, gangrene of the pleura, and symptoms of malignity, which should render a guarded prognosis and the adoption of every precaution, necessary; at the same time the existence of these complications is not by any means a contra-indication to the performance of the operation, if the symptoms are urgent; and it is in such cases that a medical man equal to the occasion and assuming the responsibilities of it, should be able to decide without hesitation, but with certainty, that competent interference if powerless to prevent evil, is at least incapable of aggravating it.

Special.

FRANCE.

[FROM OUR SPECIAL CORRESPONDENT.]

VISCERAL RHEUMATISM.—At a meeting of the Academie de Médecine M. Woillez read the report of a work by Colin upon visceral rheumatism. Along with others, the author found that pleurisy of a rheumatic nature could be distinguished by a peculiar friction sound having for seat the junction of the superior with the middle third of the axillary region. This symptom M. Colin considers as indicating an arthritic affection although the patient may not have had previously any rheumatic trouble. The friction sound resembles the dry crepitation of the first stage of pulmonary tuberculosis, and is especially marked on the right side. The sign appears to him symptomatic of all pulmonary affections of an arthritic nature.

THE TREATMENT OF RANULA.—An important discussion took place before the Société de Chirurgie on the treatment of ranula in which nearly all the members took part. M. Delens recited a case in which the cyst was excised and cauterised, but at the end of two months it returned. This fact, he believed, resulted from the migration of the sublingual ranula through the muscular fibres of the floor of the mouth and developing a cyst in the buccal cavity. M. Trelat for many years excised with the scissors in the case of small ranulae, and where they were more voluminous he treated them by puncture and the injection of iodine. M. Després treated every kind of ranula by the drainage, and always with success. M. Varneuil observed that he tried many methods in the treatment of ranula, but with varied success. He adopted the plan of slow section, for which purpose he passed a curved needle charged with a double thread of silver wire through the cyst, and united both ends in a firm knot. In five or six days the section was effected. M. Labbé did not doubt the success obtained by M. Després by his method, but he considered that to keep a seton in the mouth for six months to cure a ranula constituted a veritable infirmity. M. Després, in replying, said that he never knew a patient to complain of it. M. le Dentu said that M. Auger employs the injection of two drops of chloride of zinc in the deliquescent state into the cyst without previously evacuating it. This treatment always succeeds; there follows a sharp inflammatory reaction, but it is by no means dangerous. The inflammation subsides in five or six days, and at the end of ten days the cure is complete. For small ranulae one drop of the liquid

suffices, and if the cyst is very voluminous it is preferable to draw off a little of the contents before introducing the chloride of zinc. M. Gillette could not agree with M. le Dentu in considering that chloride of zinc was not attended with danger and that it was always successful. He had seen M. Auger at the Hôpital Beaujon inject three drops and the pain was so intense that patient tried to jump out of the window; and after all the cyst returned and was eventually excised.

MURIATE OF IRON IN CHRONIC DISEASE OF THE SKIN.—Dr. Casarini has collected a certain number of observations of chronic disease of the skin in which the external employment of the muriate of iron had been of incontestable utility. He employed the dose of thirty or forty drops in the form of lotions or mixed lard as an ointment. The diseases of the skin in which this agent appeared to be most efficacious are sub-acute and chronic psoriasis, eczematous lichen, and in eczema when all inflammation had disappeared. The conclusions of the author are as following: 1st. Perchloride of iron is the most active remedy against purpura hemorrhagica and simple purpura. 2nd. It is very useful against the cachetic chloro-anæmic state which frequently accompanies certain diseases of the skin, rhyphia, oöchymosis, and impetigo. 3rd. Externally it exercises a prompt and favourable action in scrofulous and syphilitic ulcers (constitutional syphilis). 4th. Employed as a pomade perchloride of iron is an energetic remedy against squamous affections of the skin, notably psoriasis.

(Continued from page 9.)

ADELHEIDSQUELLE.

A Bavarian spring situated near Heilbrunn; is largely imported. It has been analysed by Pettenkofer, whose analysis we give, calculated to grains per imperial gallon:

	Grains.
Chloride of sodium	380.68
Bromide of sodium	3.67
Iodide of sodium	2.19
Chloride of potassium	0.20
Sulphate of sodium	0.48
Carbonate of sodium	62.16
Carbonate of calcium	5.84
Carbonate of magnesium	1.44
Carbonate of iron	0.72
Alumina	1.42
Silica	1.47
Phosphate of lime, trace	
Organic matter	1.60

Total 461.87

Carbonic acid not determined.

Skeleton analysis of half-a-pint, or 10 fluid ounces:—

Solida.	Salinea.	Antacida.	Purgativa.
23.8½ grs.	23.8½ grs.	4½ grs.	.03 grs.

The Adelheidsquelle water is a very strong saline water, with a well-marked alkaline character, due to the carbonate of sodium. It contains comparatively little lime. It also possesses the peculiarity of containing a considerable quantity of alkaline iodides and bromides; therefore, will probably be used more as a medical water than as a table water. It is, however, as a composition based upon the lines of the table waters, and is therefore placed amongst them.

GEROLSTEIN.

At a short distance from the ruins of Castle Casselburg, between the rivers Kyll and Moselle, is an artesian well, called the Schlossbrunnen Gerolstein.

This artesian well is sunk to a considerable depth in a bed of limestone and alate. The country would appear to be a district of extinct volcanic craters, and it is probable that the Schlossbrunnen Gerolstein derives, as stated in the circulars, its chemical components—the saline and alkaline ingredients, from layers of basalt and porphyry. It is stated that this water being obtained by sinking the artesian well in the Eifel volcanic mountains that it is perfectly free from all organic matter, or impurity. The circular also states that unlike most mineral waters it is wholly impregnated with its own natural gas, or carbonic acid which rises in volumes from the shaft and rocky fissures. "The Gerolstein water is not tampered with in any way, but is delivered in the same state exactly as it flows from the spring." Although the springs are reputed as being valuable medicinal springs from the 13th and 14th century the artesian well was not opened with a view to its commercial dissemination until the year 1876, we may say that although this water is old in local reputation, it is not so well known as many others in its bottled form.

Although not many years since this water has been introduced into this country, it would seem that it has received a considerable amount of royal and high-class support. This means very little. Perhaps no class is as sensitive to a name as the higher classes. Let a company get hold of a good name, and the upper circle follows like a flock of sheep. Our remarks, however, do not apply to the Gerolstein water, and they would be quite out of place were it not for the extensive manner in which such a system of advertising is used in the mineral water world.

The Gerolstein water is comparatively a mild antacid water, giving no permanent alkaline reaction until boiled some time with phenol-phtalien, showing that the alkalinity is nearly equally distributed between alkaline bicarbonates and the carbonates of the alkaline earths. It is remarkably pure, and stood these searching tests for the presence of nitrates and nitrites, diphenylamines, and metaphenylein diamine. It is quite free from nitroge-

nous organic matter. It has been already stated that the Gerolstein Company only charge this water (which is strongly aerated) with the natural carbonic acid gas obtained from the spring; but they invite inspection of the spring and works. One of the recommendations of the Gerolstein water is that, combined with great purity, from the small amount of solids contained therein, it may be indulged in freely: at the same time, it must be always borne in mind that its action will be slightly aperient, but this, to many thousands, will be hailed as a grateful characteristic of Gerolstein.

Gerolstein water contains—

Bicarbonate of sodium	72.71
Carbonate of lithium	10
Carbonate of calcium	42.6
Carbonate of barium, trace			
Carbonate of magnesium	24.2
Carbonate of iron (ferrous carbonate)	0.10
Carbonate of manganese, trace			
Sulphate of potassium	0.20
Sulphate of sodium	8.21
Chloride of sodium	12.26
Bromide of sodium	0.11
Iodine, trace			
Phosphoric acid	0.02
Silica	3.03
			163.54

Free carbonic acid not determined.

Skeleton Analysis of Half-a-pint (10 Fluid Ounces).

Total Solids.	Antacids.	Salines.	Purgatives.
10½ grs.	8½ grs.	½ gr.	½ gr.

Correction.—Harzer water: read "pergant flavour," for "per can flavour."

(To be continued.)

Transactions of Societies.

THE MEDICAL TEMPERANCE ASSOCIATION.

THE adjourned discussion on Mr. S. Shute Alford's paper on

THE PRACTICAL TREATMENT OF DIPSO MANIA,

which appeared in our issue of June 8th, was resumed at the Medical Society of London on Friday July 8th. There was again a large attendance.

DR. RICHARDSON, M.D., F.R.S., President, in the Chair.

THE PRESIDENT alluded, in touching terms, to the untimely end of Mr. Alford, which was the result of an accident on the Midland Railway at Dudding Hill Station on July the 2nd, and said that he was sure the whole of the medical profession would be unanimous in the feeling of regret which the Association felt at the loss it sustained by Mr. Alford's decease under such trying circumstances. For a moment it was a subject of consideration whether it might be becoming to proceed with the debate that afternoon, but on the motion of Dr. Alfred Carpenter, seconded by Dr. Norman Kerr, it was unanimously agreed to resume the discussion, the sense of the meeting being that it would be more honouring to the memory of the deceased gentleman, who, as Dr. Kerr remarked, had devoted the best part of his life, and consecrated his highest energies to the question, to go on, and endeavour to investigate the subject which he

had begun, and with regard to which he had always evinced so great enthusiasm. It was then resolved, on the motion of the President, to send a letter of condolence and expression of deep sympathy, on the part of the Association, to the family of Mr. Alford, in their great and sudden bereavement.

SURGEON-GENERAL FRANCIS reopened the debate, and in the course of his speech, said that there were two distinct forms of drink craving, one in which the craving was created and developed by circumstances, and the other in which it was hereditary. He looked upon dipsomania as a disease, in the same sense as he believed neuralgia or ague were diseases. It was essentially nervous constitutions that were most liable to attacks of drink craving. With regard to the treatment of dipsomania, it was the same, both in those cases where it was created, and those that were hereditary, and he believed the superintendents of "homes" would bear him out in the opinion that cases of a hereditary nature were far more difficult to cure than those where it was created (hear, hear.) It would be found to be one of the most important features in the education of the young to carry into practice the recommendation of Dr. Norman Kerr, to bring the young up on total abstinence principles, at the same time to see to it, that the teachers themselves should be instructed, scientifically and otherwise, on all questions relating to the use of alcohol, thus creating in them a hearty interest in the temperance movement. In regard to the question of vegetarianism, that had been touched upon at a previous meeting, in relation to the Brahmins and Hindoos, he could only say that the reason why drinking was not so common among them was because it was purely a matter of religion.

DR. ALFRED CARPENTER said that the loss of self-control was at the bottom of habitual drunkenness. It was, at this point, that the victim of drink often asked for help when he found the power over his diseases waning. The resisting power of the individual was absolutely *nil* the moment that any grain of alcohol found its way into the tissues of the body. The slightest amount was like the effect of motion upon water cooled below 32 degrees in perfect quiet. There was an immediate production of ice, and the sensible production of heat. In the case of alcohol it set up drink-craving in all its force. The cure of dipsomania depended upon two conditions, the personal habits of the patient himself, and his hereditary tendencies. In the case of those where the habit was acquired, the cure would be comparatively rapid, and provided means were taken to instil proper principles as to the knowledge of the chemical action of alcohol, there ought to be no relapse when the patient came out of the home where he ought to be attended; but in hereditary cases the result might be very different. It took a lifetime to change these conditions, and yet they knew that practice would be made perfect, and that the hereditarily nervous man might, by proper education, get rid of his nervousness. There was the work of the home to inculcate such maxims, and bring the patient along a course of self-control under proper teaching, as might eliminate even hereditary tendencies, and restore the man to his original purity and mental power. He believed they could do this. To doubt it was to doubt the power of their noble profession in its first lines of work, and to lose sight of the fact that the work of the medical profession was more often hygienic and educational than one connected with the mere administration of drugs, and providing antidotes of diseases. They might depend upon it that the prevention was of far more importance than cure, and that it was the remedy of dipsomania. (Hear, hear.)

DR. HALL thought that it had not been sufficiently brought before the public by the profession, that the condition of the mind of an habitual drunkard was such that he was often not responsible for his actions, and although we were making great efforts in the right direction, where was the institution of hospitals in which the poor drunkard would be treated medically for his disease? He could not send a case to the workhouse, or the parochial infirmaries, because the patient would be refused admission. Drunkenness was looked upon there as a matter of vice. But he believed if there were hospitals established for drunkards, where they could go without the necessity of making application, and all the formalities that rendered the machinery of public and charitable institutions so clumsy, and where the disease would be properly treated as a disease, incalculable good would be done. (Hear, hear.)

Mr. FREDERICK JOHN GRAY, of Rugeley, said that his whole experience led him entirely to sympathise with Mr. Alford's views. He was quite satisfied that men who had been drinking for some years, and especially those who had done so for some depressing cause, whose nervous system was entirely exhausted, could not be restored to health by a few months' treatment. He had also come to the conclusion that in private houses, the only service they could be to drunkards, would be where that class of them who had been hard drinkers, and who were anxious and willing to do their utmost to help the medical man to cure them. But there was another class they could be of no service to, but that retreats would be found of great use in bringing them back to health if properly conducted. This was the class of men who liked drink, and had been drinking for many years, and who cared very little about their position or family ties. If they were long enough confined in retreats, where all drink was compulsorily kept from them, they might be restored to health, after which moral suasion might be brought to bear upon them with a view to keeping them from returning to their old courses.

Surgeon-Major POOLE thought that dipsomania was not only a disease, but also a vice, and he believed that homes for inebriates would be most valuable, because the medical element might be brought in contact with the clerical or religious element, and so the dipsomaniac would have a double influence at work in effecting a cure upon him.

Dr. R. PARAMORE felt that the religious element in the cure of dipsomania was a most important one. Unless they could make a man feel that he was responsible to a higher being than himself, there was not so much motive in his denying himself. No person could possibly be reclaimed unless the religious instinct was touched. He felt certain that dipsomania was a disease, and its victims required to be acted upon by all the moral and physical means in their power, so that they might give up their intemperate habits.

Dr. RICHARDSON then summed up the debate, and said that with the exception of Dr. Edmunds, there had been a singular unanimity of thought and feeling on this question. It had been his duty to perform the office of chairman many times in his life, he had almost said hundreds of times, but he did not recollect a prolonged debate of this kind, in which there was such a general unanimity of feeling and judgment as in this instance, and he believed that if the subject were argued fairly with Dr. Edmunds himself, he would, in the main, join with all that had been said. When Dr. Edmunds was speaking on the last occasion, and remarked that dipsomania was not to be considered as a disease, he, the speaker, wrote down on a piece of paper, "What is a disease?" which Dr. Edmunds, seeing, made a comment upon. Well, he said, that that was a disease which was attended with some definite pathology. That he fancied could not be disputed by anyone. Then came the question whether dipsomania was attended with any particular pathological indication, and he thought if they brought the matter to this crisis, they were, at once, forced on physical grounds to admit, that dipsomania was unquestionably as marked a disease as any other form of malady which they come in contact with. The medical man summed up all the symptoms in the same way as he would sum up the symptoms of pneumonia, bronchitis, peritonitis, or typhoid or typhus. These were considered diseases, because of the recurrence of their symptoms in the same form, and so with regard to dipsomania, the recurrence was so striking that there would not be a difference of opinion between any two of them, what the nature of the case was, and so he saw no means of getting out of admitting that it was a disease. When they came to the pathology, as indicated in the changes which took place in the body, they found certain marks which were perfectly indicative of diseases. Dipsomaniacs had changes going on in various organs of their body, which were essentially typical of the condition in which they were. For example, there would be, in all of them, at one time, a very equal, and at another time, a very slow and feeble rush of the heart. They would listen to the heart one moment, and the impulse would be so great that it struck hard upon the ribs, and they would get a continued sound, so that they could not distinguish one series of sounds from the other, and they would find in another case the heart so feeble that they could scarcely distinguish the sounds at all, though as regarded the change in the mechanical working of the heart, it was most distinct in its character, and, in every sense, pathognomonic. If they came again to the great vessels, they found changes

taking place in them. They found the arteries at one time relaxed, and at another, distended; they found, sometimes, a full and bounding pulse, and often a feeble one, and all that was indicative and pathognomonic of disease. If they came to a more minute examination of the phenomena, they found some changes going on in the nervous system, which, though they might be temporary in character, were as distinct as those changes which marked hysteria or tetanus. If they defined this as a disease, then they had to consider it as such, and to consider it in relation to treatment, and here was one of the most remarkable phenomena in relation to dipsomania, that it recurred under very slight promptings. Not the effect of ipecacuanha upon persons who were easily subject to the form of asthma; not the mere breath of that was more striking than the action of alcohol on certain singularly constituted individuals. Dr. Richardson, in support of this theory, related a melancholy case of a woman who had been an abstainer for fifteen years, but who, under a severe pressure of work and anxiety, fell into a syncope, and was treated by her medical attendant with brandy, which, for the moment, she tasted; it gradually exercised its former influence over her, that it ended, if not, in her death, in her being immured in an asylum. With regard to the question of treatment, he believed they were all pretty unanimous. Such a case as that which he described, would elench every argument that had been delivered in that room, that there was no cure whatever for such cases, but abstinence to the last day of their lives. (Cheers.) He entirely agreed with Mr. Alford, that anything that produced a physical or mental depression, would turn the scale, and give rise to the desire on the part of a reclaimed drunkard, to go back to his former habit of drinking, and that desire would lead him back to the acute stage, and, finally, the acute stage would lead to absolute relapse; as, for instance, the effect of the East wind, which Mr. Alford had mentioned, and which he (the speaker) looked upon as a very interesting, and a profound observation, because he felt quite sure, having looked over his own books for a lengthened period, that cases of dipsomania were much more frequent in the spring weather than they were in summer. He took it in the management of such cases, after removing stimulants, that the next best thing was to provide, as far as possible, every comfort, and everything that would conduce to the support of the patient. He quite agreed with the observation made by one of the speakers, that deficiency of sleep tended to bring about a relapse, and he therefore agreed with all that had been said as to the importance in treating patients in giving them plenty of food, sleep, and warmth, and relieving them of all the distressing causes that had a tendency to produce exhaustion, and therefore a tendency to the taking of stimulants. Now, coming to purely medical details, what were the best means of making those people sleep when under treatment? What right had they to give patients a substitute of any sort for alcohol? He confessed he saw very little good in substitutes himself; yet sometimes they got conditions of the stomach which seemed to require something to stimulate its action. If there was great acidity, as often happened, nothing answered so well as a mixture of carbonate of ammonia (five grains), tincture of capsicum (ten minims), with a little infusion of hops to make up the draught, which he found answered exceedingly well. If there was not acidity, and if the alkalies produced irritation, and even heart-burn, he generally resorted to a draught composed of five minims of tincture of nuxvomica, with an infusion of hops, and ten minims of nitro-muriatic acid. Very frequently, when there was an immense thirst, as there often was in those people, he found an infusion of henbane, with half an ounce of liquor ammoniæ acetatis, and from three to four grains of bicarbonate of ammonia in half a pint of water, to be taken at bed-time, very efficacious. If there was a great deal of nervous restlessness, from twenty to thirty grains of bromide of potassium might be added. This would be found to be an excellent narcotic in place of chloral, which he at one time believed in, but which his experience did not confirm as being a useful drug. It led to a desire for alcohol, its action being very much the same, while opium produced great nausea and constipation, accompanied with biliousness. One other point which he wished ever to be kept in mind was that the skin should be kept in good action, and in moments of depression exceedingly useful results would follow from Turkish baths. He wished he could agree with those speakers who thought they found a panacea for drunkenness in religious influence. There was no doubt it was beneficial in some cases, but in others, notably the

MEDICAL PRESS AND CIRCULAR SPECIAL REPORT

ON THE INTERNATIONAL MEDICAL & SANITARY EXHIBITION, SOUTH KENSINGTON.

INTRODUCTORY.

THE 1881 meeting of the International Medical Congress having been fixed to be held in London, the occasion seemed a most fitting one for bringing together a collection of articles illustrative of the present position and recent progress in medicine and surgery and their allied sciences. This idea having been broached, the question of carrying it out was considered by the Committee of the Parkes Museum of Hygiene, and the result of their exertions has been the formation of an exhibition, in every respect, more complete and elaborate, in so far as it is concerned with sanitary and medical science than any which have preceded it. It should be said that the chief share in this gratifying termination to their labours is entirely due to the disinterested and unceasing exertions of the Committee of the Parkes Museum, and that no small part of the work accomplished has been borne by the Secretary, Mr. Mark H. Judge. From the earliest inception of the idea to perpetuate the name of the late Dr. Parkes, in connection with that branch of science, to which his whole life had been devoted, Mr. Judge has been indefatigable in endeavouring to secure a great and lasting success for the scheme; and it may, perhaps, be well to recapitulate briefly the principal aims held in view by the exhibition committee of the museum. They estimate that a sum of £30,000 will suffice to establish the Parkes Museum as a permanent National Institution, and enable the public to enjoy for ever all the advantages which it is capable of affording; and when it is stated that the temporary accommodation hitherto so generously accorded by the Council of University College will not be much longer available, were it even sufficient, and that a new home for the museum is most urgently needed, the Executive Committee have every confidence that their appeal will meet with a liberal response, and that the means will not long be withheld for raising a memorial building which shall be worthy both of the nation, and of the great man whose name the museum bears.

The present exhibition will undoubtedly be productive of an addition to the funds of the museum, both through the success that will certainly attend it, and by serving to excite a keen public interest in the object it is designed to serve. It is held in the galleries opening on to the gardens of the Royal Horticultural Society at South Kensington, and also, in part, in the Albert Hall. The space it commands has been amply sufficient to meet all requirements made of it, and is of a nature to admit the most advantageous disposition of the objects, arranged with a view to easy examination by visitors.

The opening ceremony took place on Saturday last, and, at this time, the public have access to the collection on every week day, between 10 a.m. and 7 p.m., until August 13th.

The opening ceremony was attended by about 2,000 persons, who showed considerable interest in the Exhibition immediately the formalities attendant thereon were gone through. At half-past four o'clock Earl Spencer took the chair in the Albert Hall, supported on the platform by Earl Granville, K.G., Sir James Paget, Bart., Mr. Erichsen, the Executive Committee of the Parkes Museum, and a goodly sprinkling of the profession. The first event in the programme was an inaugural address by the Lord President of the Council, Earl Spencer, who subsequently called upon Dr. G. Vivian Poore, the Honorary Secretary, to read the report of the Museum; a statement of the Exhibition Committee followed, read by the Secretary, Mr. Mark H. Judge.

Earl GRANVILLE then delivered a very telling and, in some parts a most amusing, speech, of which the following is a fair *résumé*: He said, My Lords, Ladies, and Gentlemen,—At a moment when London has its hands so full of business and

pleasure, your presence here in such large numbers is very clearly significant of the interest which is excited by the objects of this Exhibition. I must admit that when I received the card of invitation, and found insidiously inserted on the back of it that Lord Granville was expected to deliver an address, my heart sank within me. I was, however, much comforted also by thinking of the practice which is usual at some of our best theatres, where the managers, desirous of meeting the wishes both of those who like a quantity for their money and of those who like to dine before their theatrical amusements, advertise the great piece of the evening to begin at eight o'clock, and then insert in smaller letters that there will be some trifling play acted beforehand. I think the object of the promoters was that I should say some light and airy nothing in order to pave the way for one of those admirable addresses into which Sir James Paget condenses so much valuable scientific, yet useful information. I think it was Dr. Parkes himself who defined hygiene as the art of preserving health—that is to say, of giving the most complete action to the mind and body for as long a period as is consistent with the laws of life. We all sometimes, voluntarily or involuntarily, think and talk of health. I venture to think that if any of you here present have ever been rash enough in company to admit you had some indisposition, that you found the majority of that society immediately insisted on prescribing for your diet, for your regimen, and especially their own favourite pills. I remember myself, some years ago, having a severe attack of gout at Rome. I was immediately inundated with prescriptions, not only in English and Italian, but also in French, German, and even in Russian. The Cardinal's Secretary honoured me with a prescription based upon his own experience, and a northern Foreign Minister gave me exactly the opposite advice, the unhappy result of this combination being that I could not get well until I had left that glorious old city for good. This last Easter, in the daily papers, it was announced that I had a serious attack of gout, but, luckily, at least, for me, the report was without foundation; but I have been most deeply touched by constantly, I may say weekly, daily, and hourly, receiving letters of advice on that most interesting topic. I have been advised to drink whisky. I have been advised to drink claret, and I have been advised to adhere to the most rigid teetotalism. I have been advised to live generously. I have been advised almost to starve myself; and one gentleman, whom I will not suppose to be a dentist, advised me to obtain a complete apparatus of artificial back teeth. (Laughter.) The moral I gather from this is that in maintaining the health of an individual study alone, or experience alone, is not sufficient. I believe that you require science, art, and experience to be of use in such matters. And if this is the case with the health of an individual, how much more is it true with regard to the health of large communities? Lord Spencer referred to the satisfactory statistics which have been produced in the recent census; but that census shows how we are increasing in numbers. I think with regard to this metropolis alone that the numbers are very near that enormous quantity of something like 4,000,000 of inhabitants. I dare say many here remember the observations of Archbishop Whately with regard to the great problem of affording food to such a great agglomeration of human beings in such a comparatively small place. How easy it has been done by the self-interest of individuals! How impossible it would be for the Government to do it efficiently, and without enormous waste, if they attempted the solution of that problem. But besides food and air, there is water, almost as necessary, both for cleanliness and for drink, and for its operation against fire, and in this city we are most imperfectly provided in respect to those requirements. The sanitary question is one of very great difficulty, but it is perfectly essential that the principles should be perfectly understood, not only by the specialists, but that they should be disseminated in order to produce a healthy public opinion on such matters as these. I think that is exactly the sort of information on sanitary science which an Exhibition like this, the outcome of the Parkes Museum, is so admirably intended to provide. I may perhaps be allowed to say that her Majesty's Government are perfectly alive to the necessity of this great sanitary reform movement; but you are aware that the present Session of Parliament is barren of this sort of legislation. I am, however, happy to say there is one measure, with regard to the flooding of rivers, which appears most essential to the health of both towns and villages, which we have got to that point when we have a very strong hope to be able to pass it into law.

Sir JAMES PAGET then followed. He spoke very touchingly and eloquently of the labours of his deceased friend, Dr. Parkes, who, he said, for many years prior to his decease, had laboured as few men could, with the knowledge that at any moment the disease from which he suffered might have a fatal termination. This magnificent exhibition was the outcome of that once great and noble man, which would, he hoped, perpetuate his memory to all time. Sir James said he was also interested in this exhibition because it was coincident with the International Medical Congress, in which he had already taken a very active part, and for which he would probably have to labour still more. The two would, he said, be visited by hundreds of medical and scientific men from all parts of the world. Already more than 600 foreign physicians from America, Asia, and Europe, had signified their intention of being present, and whatever success might attend the Medical Congress, the credit of nine-tenths of it would belong to that most persuasive and indefatigable of hon. secretaries, Mr. MacCormac, of St. Thomas's Hospital. There was no ignorance so intense, remarked Sir James, as the ignorance of self-satisfaction; but when the labours of Mr. Simon and other members of the Local Government Board were taken into account, we had very much to show for the results of the teaching of sanitary science in this country during the last few years. Such exhibitions as the one which they were assembled to open must do much to promote the knowledge of sanitation. Amongst the exhibitors themselves a wholesome rivalry in the attainment of what was as near perfection as possible was set up. Mutual criticism of each others' appliances was likely to bring out the weak and strong points in such things, and perhaps exhibitors looked at each other's goods with keener eyes for defects or improvements than were possessed by the eminent judges of the awards. A spirit of emulation was set up, and the public in the long run were the gainers. Sir James spoke at some length on the various ways in which the Exhibition would help in education, and concluded by saying that he hoped that the success of the Exhibition would be such as to help in placing the Parkes Museum of Hygiene on a more permanent footing, seeing that that Institution sought to perpetuate the work to which Parkes devoted the best years of his life.

After the conclusion of Sir James Paget's speech, which was listened to with wrapt attention, Earl Spencer formally declared the Exhibition open. A vote of thanks to the chairman was then proposed by Mr. George Godwin, F.R.S., seconded by Mr. Erichsen, F.R.S., and carried, and the company adjourned to the Exhibition.

We propose issuing a series of Special Supplements, containing a description of the Exhibition, in the *Medical Press and Circular*. The space at our command will necessarily cause these remarks to be very often of limited extent, but we shall hope to be able, at any rate, to draw attention to the more prominent features of the collection. We shall commence with an account of certain of the

DRUGS AND PHARMACEUTICAL PREPARATIONS.

We do not know who is responsible for the arrangement, or rather want of arrangement, in the space allotted to various exhibitors; certain is it that in some cases it is lamentable, and likely to cause considerable dissatisfaction. For instance, two of the best and most extensive exhibits of drugs and medicinal preparations, Messrs. Savory and Moore and Messrs. Burroughs, Wellcome and Co., are placed quite away from all the rest, upon another floor, and with an almost inaccessible entrance. Here, also, are placed all but one of the exhibits of surgical and dental instruments and appliances—a most important section of the exhibition—in an out-of-the-way gallery which few will find without much trouble, and to reach which visitors have to pass out at the turnstile ticketed "Way Out." Surely some better arrangement than this can be come to? The injustice was plainly visible at the opening, when the lower courts were thronged, and this Western Gallery had scarcely an occupant, for the simple reason that no one knew how to get to it. Downstairs an insignificant case of surgical instruments, by Messrs. Hilliard, of Glasgow, was the sole representative of this important branch, while cases of heroic proportions, by the leading

makers in the United Kingdom, were consigned to an unapproachable gallery. We ask, why was this little case separated from all the rest, and made to do duty among exhibits of other classes, as if the rest were unworthy of consideration?

But—to return to "drugs"—were it for no other reason, the exhibition would be worth a visit from all who can make it convenient, for its display of novelties in pharmaceutical preparations alone. Such a representative assemblage of products from the leading houses in this country and the United States has certainly never before been seen. With pills and parvules of every make and hue, the uninitiated will almost imagine that the inhabitants of the three kingdoms have here enough and to spare for the rest of their natural lives. Here should any enterprising visitor wish to test the merits of the various pills shown he will be gratuitously supplied at each stall, and if he succeed in reaching the end of the quadrant, he will probably not question their powers, or return "by the way in which he came." Of mineral waters too he can have his fill, as Earl Spencer remarked, "from the beautiful appollinaris to the bitterest of all bitter waters." Various non-alcoholic preparations are also gratuitously tendered, and the visitor can test his palate with *Vin Sante* or *Sparkling Hedozone*, with Evans' and Leschers' *Montserrat Lime Juice Cordial*, or an equally delicious importation of *Specialité Lime Cordial* of Messrs. Feltoe and Sons. Then, too, he can taste the rival malt extracts, for all are here; the well-known *Maltine*, *Kepler*, *Loeflund*, *Allen* and *Hanbury*, *Corbyn*, and the *Hoffs*, all anxious that the visitor should "taste and try, but not to buy," for buying is not allowed during the first three weeks of the Exhibition.

We will now proceed to give our readers some idea of the nature and extent of the exhibits in this department.

ALLEN & HANBURY.—This well-known firm have, at No. 164, in the Western Quadrant, a very handsome stall, on which are exhibited an extensive collection of the articles for which they are celebrated. They show a new patent vaporiser for use in whooping-cough, the medicament employed in it being cresoline. The instrument is the invention of an American, and consists of a metal tray, supported over a lamp, cresoline, a product of coal-tar, allied to phenol or carbolic acid, being placed in the former, and vaporised by the heat of the lamp. The inhalation of vapour of cresoline is said to have an extraordinary effect on whooping-cough, causing it to rapidly diminish in intensity, and disappear. It is servicable also in asthma, and possesses the additional advantage of being a powerful disinfectant. It may be adopted in this country with much possible benefit; the apparatus is neat, handy, and cheap.

Medicated Throat Pastilles.—These are an elegant preparation from formulae, suggested by Dr. Prosser James, and are twelve in number, containing morphia and ipecacuanha, separately and combined, camphor, lithia, potassium, chlorate, iron, &c., &c. They are put up in bottles and boxes, and are admirably adapted to be prescribed in cases where such remedies are required in an attractive and readily accepted form.

Cod-liver Oil, as prepared by Messrs. Allen and Hanbury, and named by them "perfected" has long been favourably received by the profession; in addition, they show a very fine oil made by the ordinary process, and for which they were awarded medals at Philadelphia and Paris; both these oils are most excellent preparations, the perfected variety being possibly superior on account of its "non-repeating" properties.

Tonga, for which so considerable a reputation has been secured on account of its influence over facial neuralgia and a number of very beautifully made tinctures, &c., are noticeable features on this stall, the last of whose contents to which we would call particular attention being the *Patent Malted Farinaceous Food*, in which the malt is present in a soluble, concentrated, and most active form.

CORBURN, STACEY, & Co's stand, No. 173, is a handsome and perhaps the most artistically-arranged, collection of

drugs and pharmaceutical preparations in the Exhibition. This firm exhibits samples of the pure chaulmogra oil, which has been found so remarkably efficacious in a large number of skin diseases. Though until comparatively recently employed by only a few English surgeons, it is now rapidly coming into favourable notice, and Messrs. Corbyn, Stacey, & Co. have made arrangements to enable them to supply the pure material in any required quantity. They have, also, various samples of *Chian turpentine*, for which Prof. Clay, of Birmingham, claims specific properties in cases of cancer. The *Syrup of Chloral*, manufactured under Dr. O. Leibrieck's guarantee, is also to be seen on this stand, together with the same physician's *Pepsin-Essenz*, probably one of the most reliable preparation of pepsine extant. Attention should be given to the cases containing medicated *pesarics and bougies*, which are as exquisitely finished by Messrs. Corbyn, Stacey, & Co., as any that can be cited. *Astonia Constricta Bark*, a valuable anti-periodic, used in Queensland, as a substitute for quinine. *Atherosperma Moschata Bark*.—The oil obtained from this bark, known as Australian sassafras on account of its odour, has long been used in Australia as a diaphoretic and diuretic in asthma and pulmonary affections. *Fluoric Acid*.—A two per cent. solution of thirty per cent. acid has been much recommended by Dr. Woakes, and has, in his hands, been highly successful in the treatment of g \ddot{u} itre or bronchocoele. *Papaw Leaves, Papaw Juice, and Papaine* have the power of digesting cooked meat, or hard-boiled white of egg, and appear in this to surpass pepsin. Unlike pepsin, they do not act in acid solutions. *Stigmata of Maize* has a most evident action in many affections of the bladder, recent or chronic. In gravel, chronic cystitis consecutive to gravel, and in mucous muco-purulent catarrh the best results are obtained. *Liq. Ferri Iodid, and Liq. Ferri Bromid*.—These beautiful green liquors, for the ready preparation of syrup, remain unchanged by exposure to light and air. *Quebracho Bark*.—Very fine young bark. *Oil of Eucalyptus*.—This has recently been used by Prof. Lister as an antiseptic, in place of carbolic acid. The same firm act as agents for Valentine's preparation of meat juice, samples of which are on view, and in which dieticians will probably be much interested.

RICHARDSON AND Co. (Leicester).—The stand occupied by the exhibits of Messrs. John Richardson and Co., of Leicester, is numbered 163, and will at once strike the eye of the visitor on account of the elaborateness which it displays. The principal item in the list of things displayed is, of course, the *Soluble Pearl-Coated Pills*, with which the name of the firm is associated. The number of different formulæ according to which these pills are prepared, amounts to nearly 700, and for elegance of appearance they are certainly not excelled by even the best of other makers. The manufacturers claim for them perfect and speedy solubility when introduced into the body, complete preservation even in the hottest climates, and the avoidance of unpleasant taste by virtue of the coating which surrounds the pill-mass. A selection of these pills, together with the more commonly required tinctures, &c., are contained in the compact, handy, and wonderfully useful *emergency cases* made by Messrs. Richardson for pocket carriage, and for the table. Among the special articles shown on this stall we would mention the *Thymol Soap*, a safe and pleasant antiseptic toilet requisite; *Excelsior Cod-Liver Oil*, the well-known *Tincture of Gelsemium*, and *Richardson's Liquor Picis Comp.*, this latter being an exceedingly useful remedial agent in the treatment of foetid sores, ulcers, &c., and in most skin affections. A complete and useful catalogue of Messrs. Richardson's goods has been specially prepared for distribution amongst visitors to the Exhibition, and may be obtained at their stall.

MESSRS. F. NEWBERRY & SONS, No. 165, exhibit a case chiefly filled with the articles for which the Philadelphia firm of W. R. Warner and Co., are celebrated. The special exhibit is, naturally, the *Sugar-Coated Pills*, against which so many other varieties of coated pills have been introduced. Messrs. Warner have continued the use of sugar as an envelope because experience has convinced

them of its superiority over gum, chalk, gelatin, &c., in this respect. They urge, moreover, that the tendency of sugar to attract moisture leads to the softness of the pill being preserved, and on the point that no direct application of heat being necessary to dissolve the covering itself they also insist. The round form, too, is preserved by them, as being more easily swallowed, and as not being subject to the charge of inelegance associated with pills other than round in shape, and covered with a substance permitting the colour of the drug to be seen through it. *Ingluvin*, introduced by Messrs. Warner some time ago, a substance obtained from the gastric membrane of the fowl, and employed in the same manner as pepsine, is exhibited, and samples may be obtained for trial on application. The *Parvules* are elegant preparations of the chief drugs given in the shape of pills, and intended for children. Each parvule contains the minimum juvenile dose of the particular remedy included in it; and the introduction of this plan of prescribing has been attended with much convenience to practitioners. We cannot fail to admire the excellent finish and beauty of the Parvules manufactured by Messrs. Warner, and the stand whereon they are exhibited will prove a very attractive feature in the Western Quadrant.

MESSRS. MACKAY, MACKAY & Co., whose stall is at No. 239, exhibit a large number of new remedies and special preparations that will be interesting to the physician. Of these, perhaps, the best known is the *Quinquinine* (registered), containing the pure alkaloids of the official cinchona barks. It costs only half as much as sulphate of quinine, and in many cases may be effectually substituted for it, the dose being the same as for the older remedy. The history of the Peruvian bark-tree is one of great interest, and the world has long been indebted to the mountainous regions of the Andes for these barks from which the inestimable quinine is prepared. The story of the reckless destruction of cinchona trees has often been told, and serious fears, far from being unfounded, were entertained, that some day the supply of Peruvian bark would fail us. To ensure a constant and never failing supply, the attempt was made to cultivate these trees in India and elsewhere, an attempt, as our readers well know, which has been crowned with marvellous success. Of the alkaloids found in the Peruvian barks, quinine has, for a long time, been looked upon as the only one of value, and, therefore, barks containing the largest percentage have, and still will, realise the highest price. The other alkaloids have almost been looked upon as mere bye-products. The results, however, of the Madras, and other medical commissions, have done much to place these other alkaloids on their proper bases, and it is now generally agreed that in febrifugal value, quinidine is equal to quinine, cinchonidine slightly less efficacious, and that cinchonine is certainly less valuable, but that if administered in larger doses, the desired result is obtained. The isolation of quinine, existing, as it does, in much smaller percentage than is the case with the other alkaloids is a costly and troublesome one, and a preparation, containing a mixture of all the alkaloids, seems to point a way out of the difficulty, and some progress in this direction has already been made in India; and also in this country. The growing importance attached to bismuth in cases of stomachic disturbance has caused a large number of special preparations containing bismuth in solution to be made. One such is offered by Messrs. Mackey, in which the metal is combined with chloroform, nux vomica, and hydrocyanic acid, with or without morphia. The solution, to all appearance, leaves nothing to be desired, and will probably commend itself to general approval. On this stall also is a very elegant preparation of Hamamelis, a hæmostatic which English practitioners are beginning to appreciate more widely than hitherto. Messrs. Mackey have registered the name *Saxcere*, which they apply to a pure white or yellow wax, designed to serve as the basis for ointments, &c. It is (*Saxcere alba*) colourless and odourless, does not turn rancid, and exerts no injurious action on the skin or system. The last

article we would direct especial attention to on this stall is the *Mistura Ceri Comp.*, a new and soluble compound of ammonio-citrate of cerium with chloroform, nuxvomica, and hydrocyanic acid. This is given as a specific against the vomiting of pregnancy, and as an alleviator in carcinoma, &c. It is a very beautiful preparation, and deserves to be widely made trial of.

MESSRS. MOTTERSHEAD & Co. (Manchester).—The important contents of this stall, No. 24, are the preparations introduced by Mr. Bengier, and designed for the assistance of persons suffering from deranged digestion. The *Liquor Pancreaticus* is a solution containing the two ferments, proteolytic and diastatic of the active pancreas, and by its means food may be so prepared as to be available for immediate absorption following ingestion. Alone, the same *Liquor Pancreaticus* has been administered with unmistakable success, and since the notice these products obtained at the hands of Dr. William Roberts in the Lumsleian Lectures, their employment has been attended with the most satisfactory results. Mr. Bengier offers a number of substances, ready peptonised for invalid use, samples of which are exhibited by Messrs. Mottershead, and can be examined at their stall. Among them we would enumerate the *peptonised beef and wheat jellies*, and the *pancreatised farinaceous food*. But little need be said in commendation of these articles, since the success attending their employment in those cases to which they are specially adapted, have proved incontestably that they are pre-eminently adapted to the purpose they are designed to serve. The *Continuous Current Leclanche Battery*, exhibited by Messrs. Mottershead & Co., will repay examination. For purposes of Faradism in clinical work, there is probably nothing more reliable or satisfactory; the simplicity, ease of working, and graduating power it possesses combine to make it a most efficient assistant to the physician.

MESSRS. SCHIEFFELIN & Co. (New York).—The articles intended for exhibition by this well-known firm were, unfortunately, lost in the wreck of the steamship *Britannic*, so that any complete account of them is impossible as yet. A duplicate series, however, is we are informed, on the way from America, and it is hoped that by the end of the week the case will be completely filled. The speciality on which Messrs. Schieffelin base their claim to attention is *soluble pills and granules*, samples of which were shown on the opening day of the exhibition. These are most beautifully made pills, coated with an inert, soluble compound, which may be found by trial to dissolve almost immediately on the tongue, thereby bringing their coated pills on a level, as to efficacy, with the best uncoated articles. In addition, the envelope is perfectly transparent, whence the exact colour and appearance of the pill-masses are at once disclosed to the eye, and it becomes an easy matter to distinguish the different pills from one another, and thus prevent mistakes arising, such as may occur when the outside of all the pills employed is the same. By careful manipulation the exact equality of the pills of a kind is maintained, and the materials employed in their manufacture are the best obtainable. Remembering the many pills claiming the approbation of the profession, and the bases on which the claims made depend, it is almost impossible to avoid the conclusion that those of Messrs. Schieffelin combine all the qualities sought in a good pill, while in appearance they yield to none for elegance and shape. They are, moreover, permanently protected, and retain their qualities for years. They are made in four hundred varieties. We hope to speak further, bye-and-bye, of the other exhibits prepared by Messrs. Schieffelin and Co.

MR. R. W. GARDNER, of New York, exhibits a *Syrup of Hydriodic Acid*, in the preparation of which he has overcome the difficulties hitherto experienced with this substance, and has succeeded in obtaining an *unchangeable* fluid available for internal administration.

MESSRS. BURROUGHS, WELLCOME, & Co., who occupy No. 2 stand, show a large assortment of the preparations in connection with which their names are so familiarised

to dispensing practitioners. Among these a somewhat recent addition is the *Burroughs' Hazeline*, consisting of an alcoholic extract of the fresh, green *Hammamelis Virginica*, or witch hazel. The success achieved by the use of this agent in America has induced its introduction to this country. It is now being more and more extensively employed as a hæmostatic, and, in the form of a lotion, in rheumatic affections. It is attended with good results in the treatment of hæmorrhoids, and in many ways seems destined to be serviceable in practice. *Syrup of Hypophosphites* and *Beef and Iron Wine* are also among the exhibits on this stall, the former still holding its reputation, part of which may very well depend on the beautiful appearance of the preparation. The same firm also exhibit that well-known malt extract, "The Kepler," with its various combinations, so familiar to our readers as not to need recapitulation here. At this stall also there is an extensive display of Wyeth's Compressed Tablets, and Wyeth's Compressed Soda-Mint Tablets, each tablet of this latter contains four grains of bicarbonate of soda, a quarter of a grain of carbonate of ammonia, and a sixth of a drop of oil of peppermint. They are well adapted for cases of dyspepsia with flatulence, acidity, and heartburn. The soda and carbonate of ammonia act as antacids, whilst the antiseptic action of the peppermint checks butyric acid fermentation. The Ovoid Pills of McKesson and Robbins, of New York, are also shown with much elaborateness, and very beautifully made little pills they are, certainly a wonderful improvement on the old-fashioned bolus. Most of the preparations of this very enterprising firm, a firm, by the way, noted for its prompt production of American pharmaceutical novelties, have been so recently described in our columns, that a further detailed description is unnecessary. The "Enterprise" Drug Mill and Tincture Press supplied by Messrs. Burroughs and Wellcome are cheap and extremely useful instruments, and may be seen at the stall containing the firms' exhibits.

CHESEBOROUGH MANUFACTURING COMPANY.—The stand of this Company is No. 119, in the Western Arcade, and contains a considerable array of the articles manufactured from the universally-known Vaseline. This bland, inodorous, tasteless substance, retains its position as a basis for ointments, and it is made to serve many other purposes in an equally satisfactory way. There are shown at the exhibition a number of jars containing ointments made up four or five years ago, and which preserve to this time all the features they originally possessed. They have undergone no decomposition, smell sweet, and, to appearance also, are perfectly unchanged. The other preparations, such as soaps, confections, camphor ice, &c., &c., into the composition of which vaseline enters, are similarly permanent productions, and all are elegant and attractive to the view. The contents of the stand appropriated to the Cheseborough Manufacturing Company are among some of the most interesting in the whole exhibition.

In addition to the articles noticed in the foregoing pages, there are many others bearing on the department of drugs and pharmacy. Some of those hitherto unnoticed will be included when we speak of the other exhibits displayed with them by the same exhibitors; and of the rest it need only be said that though there are a large number of most deserving articles shown, it is impossible, in a brief descriptive account, to take note of all. We have striven to call attention to the points which we deemed most likely to prove attractive to our readers, and this endeavour we shall carry through the whole of these special supplements. In the one to be issued with our next number we propose to commence by a description of the waters shown at the Exhibition, and follow this by some account of the sanitary apparatus, reserving till August 3rd an account of the surgical instruments and appliances.

Roman Catholic religion, which, instead of preaching doctrines of hopefulness, was so imperative in its dogmas, and the ministers of which were so certain and sure of all that they said that it gave rise to a disturbance of the mind, which sought relief in alcoholic stimulants. The effects of brooding over doubtful points in theology were very often most injurious. He quite agreed with Surgeon-General Francis as to the importance of trying to get all reclaimed drunkards to join and take an interest in the temperance movement. Having dwelt for a short time upon the desirability of introducing persons who were inclined to drinking habits into good society, or, after having found out their peculiar proclivities, whether they might be artistic, musical, literary, or whatever they might be, to induce them to engage their attention with such healthy pursuits, Dr. Richardson referred to the relation which smoking had to the encouragement of drinking habits, and said that if his experience was not wrong, there was no safety to the dipsomaniac who indulged in the use of tobacco. He believed that smoking at times gave temporary relief, but it was a danger of the most potent kind. Sometimes it produced confirmed dyspepsia, palpitation of the heart, and inability to take food, from which exhaustion followed; and there was a desire excited for something else in the shape of drink to stimulate, and so the drinking habits began and went on from bad to worse.

The speaker concluded his remarks by saying that he had not made up his mind as to whether there should be any intermediate institution between that which was conducted by such competent men as Dr. Stewart (Bristol), Messrs. Gray (Bugeley), Clark (Folkestone), and others, who devoted their lives to this admirable work of curing dipsomaniacs, and that institution which exclusively belonged to the State. He was not at all sure whether they should not request the Government to completely reorganise county asylums with a view to the admission of dipsomaniacs. (Hear, hear.) That seemed to him to be the basis on which they ought to find a resting place, so far as institutions for the inebriate were concerned. At the same time, he would not say a word to discourage any plan that Mr. Alford had suggested in his paper, especially for the present; but for the future he felt sure that first-class homes at the houses of accomplished medical men, and Government homes for the poor in agricultural districts, far removed from all temptation, were the bases on which they must ultimately rest for the successful treatment of dipsomania. (Applause.)

The meeting then broke up.

A SENSATIONAL double suicide has taken place at Niagara. A Mrs. Sadie Stewart and her family medical attendant, Dr. E. H. Howie, disappeared several days ago. Their bodies have been found in the Niagara river.

At the annual meeting of the Royal College of Surgeons of England on Thursday last, Mr. Erasmus Wilson, F.R.S., was elected President of the College, vice Mr. John Eric Erichsen, F.R.S., whose term of office had expired.

St. PETERSBURG is probably the most unhealthy city in the world. For three years past the weekly death-rate has been higher than any other city, and last week it exceeded the birth-rate by three-hundred and sixteen—an excess sufficient to depopulate the city in a few years.

THE "hot wave" reported in the Western States and along the Ohio Valley of North America has now, it appears, passed on to the Atlantic seaboard, and the heat has been terrible, of which we have experienced some sensation during the past fortnight in this country. Between five and six hundred deaths from sunstroke were reported in the United States last week. Three hundred and sixty deaths occurred in Cincinnati alone.

REGISTERED FOR TRANSMISSION ABROAD.

THE
MEDICAL PRESS AND CIRCULAR

Is published every Wednesday morning. Price 5d. Post free, 5½d
POST FREE TO ANNUAL SUBSCRIBERS £1 2 6
" IF PAID IN ADVANCE 1 1 0

* Post-office Orders and Cheques to be drawn in favour of—

A. A. TINDALL, 20 King William Street, Strand, London, W.C.

A. H. JACOB, 3 Molesworth Street, Dublin.

Agents for Scotland:—

MACLAGHLAN and STEWART, South Bridge, Edinburgh.

A. and W. STENHOUSE, Hillhead, Glasgow.

SUBSCRIPTIONS FOR FRANCE are received by Messrs. BAILLIÈRE, Rue Hautefeuille, Paris—post free in advance, £1 2s. 6d. per annum.

SUBSCRIPTIONS FOR THE UNITED STATES are received in New York, by Messrs. WILLMER and ROGERS; Philadelphia, by Dr. BRINTON; post free in advance, 5½ dollars (£1 2s. 6d. per annum; or direct from the Offices in this country for the same amount, if remitted by International Post-office Order

ADVERTISEMENT SCALE.—Whole Page, £5 0s. 0d. Half Page £2 10s. 0d.; Quarter Page, £1 5s. 0d.; One-eighth Page, 12s. 6d.

Small Announcements of Practices, Assistances, Vacancies, Books, &c., of seven lines or under, 4s. per insertion; 6d. per line beyond. Considerable reductions are made from the foregoing Scale when orders are given for a series of insertions. Letters in this department should be addressed to the Publishers.

The Medical Press and Circular.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JULY 20, 1881.

THE MEDICO-SANITARY EXHIBITION.

THE arrangements made for ensuring the success of the great International Medical and Sanitary Exhibition at South Kensington have been of the most admirable kind; and the result is as much a subject for congratulation to the committee entrusted with the onerous duty of carrying out the numerous details connected with it, as to the profession and the public, who are enabled to observe so easily and comfortably the grand collection of implements and materials now open to their inspection. The verdict already passed on the Exhibition is one that will be echoed by every visitor to it, and to the effect, viz., that it is incomparably the best and most complete of any that have been hitherto held. The committee of the Parke's Museum of Hygiene did not, probably, at first contemplate the magnitude of the undertaking they entered upon when they arrived at the determination to organise the Exhibition now opened. That they have succeeded so admirably in bringing together so goodly and representative an array of exhibitors, is eminently creditable to them; and it may be safely asserted that the advantages to scientific medicine and hygiene that must result from their energetic labours will be large and lasting.

On Saturday afternoon the interesting ceremony of declaring the Exhibition open took place in the Albert

Hall, the invitations thereto having been very numerous accepted by the leading members of the profession, and the whole proceeding having been of the most enthusiastic description. The Lord-President of the Council, Earl Spencer, K.G., occupied the chair at the meeting, and, in an able and felicitous address, he dwelt on the points in connection with the work of the day most likely to excite the attention of his audience. It needed not his eloquent defence of the need of sanitation, and the dignity of prevention in medicine to arouse a sympathy with the object in hand, for one of the most gratifying proofs possible that the Exhibition is regarded in its true light as an event of high importance to medicine, is the hearty unanimity of medical men regarding it. The opening ceremony could not have been more carefully arranged than it was to show the progress made in recent years with respect to sanitary measures; and Sir James Paget and Mr. Erichsen lent much weight to the proceedings by the carefully considered speeches with which they introduced the subject each had prepared.

We have no occasion in this place to enter into any descriptive account of the exhibition itself, since this will be contained in the special reports, of which the first is issued with the present number of the *Medical Press and Circular*. But it is, perhaps, right and proper that we should express the deep sense we have of the perfect success with which the whole of the arrangements have been made. In a work of such vast proportions it would have been little to cause surprise had difficulties presented which it had been found all but impossible to overcome; that they have arisen, and in numbers, we need not to be assured; but that they have been most successfully overcome, a single visit to the Exhibition will most conclusively demonstrate.

The task of the judges entrusted with the duty of making awards in the various sections has necessarily been a severe one; and in this instance, possibly more than on any previous occasion, has the labour of adjudication been complicated by the excellence of the articles claiming attention. In the department of manufactured drugs especially is this the case, the elegance and perfection of competing exhibits being of a kind to strike the most superficial observer. Perhaps this particular branch is that which will prove most attractive. There is at any rate much in it that is of absorbing interest, many of the preparations presenting features that will excite the greatest admiration among practical physicians. One great feature, indeed, of exhibitions, such as the International Medical and Sanitary, is the influence they must of necessity exert in stimulating the ingenuity and performance of manufacturers.

We have evidence in abundance, at least, that this is the effect apparent in the past, and to an infinitely larger and more important extent may it be anticipated to follow from that which is, *par excellence*, the exhibition of the age. Medicaments and pills, and preparations of natural ferments, have attained a rank of importance among the aids to treatment, of which some appropriate idea may be gathered from the numerous beautiful articles of this class exhibited by various firms of druggists. And also, in the shape of appliances, mechanical and chemical, for better conducting the practice of physic and surgery, the

improvements shown on the stalls of various exhibitors cannot but excite a wonder at the advance that is always being made.

The building in which the Exhibition is located is admirably adapted to the purpose, and admits of close and complete observation of every article that is shown. The time allotted for its continuance is wisely fixed; and as it will allow of our foreign visitors to the Congress viewing it entire, it will add additional interest to the proceedings of that body. That it will be directly beneficial in every respect to the welfare of mankind, we will not venture to doubt; and this in the direction of suggesting improvements, as much as by immediately informing the public mind on the subject and method of sanitary progress.

HOT WEATHER REGIMEN.

THE few days of tropical heat we have recently experienced are sufficient to teach us that more hot weather is in store for us. In consequence of the rapid changes of temperature in our variable climate, it is impossible for the inhabitants of the United Kingdom to adapt themselves to the different changes in their weather. By the time the question of great heat has forced itself upon their attention, the weather usually changes, and winter things appear in the outfitters' shops. Now, of course, this violent oscillation is paralysing, and prevents those measures being taken, which a little more stability in the climate would render certain. On the supposition that some persisting warm weather is before us, something may be said about how to meet it.

There is little to be said against a tall hat; perhaps, indeed, there is more to be said for it in hot weather than at any other time. It is not the wearers of "chimney-pot hats" who suffer from sunstroke. As a rule, it is the field labourer who is so stricken down. He, probably, wears a thin straw hat, which is well enough, except in intense heat. When the sun's rays come beating down upon his head, he needs something more. The best thing available is a green leaf, cabbage, or other; or some thick leaves, like those of the dock, for instance, placed within the hat. Their hair usually prevents women from sunstroke; possibly, too, they do not deteriorate themselves so much with alcohol. But a cabbage-leaf might be pinned or fastened into their bonnets with advantage.

As to clothes, the working classes are not so badly off as those persons whose avocations in life compel them to wear black broad-cloth. Professional men, ministers, and medical men especially, are compelled to wear a species of "uniform," which is well enough at ordinary times; but which becomes decidedly objectionable in tropical heat. If it be absolutely necessary that they wear black, might not alpaca be regarded as a permissible alternative? Certainly, it does not convey the same impression of neatness of apparel which black broad-cloth gives; but surely this might be waived as a non-essential when the temperature in the shade mounts over 70° Fahr.

The Germans dismiss their schools when the thermometer registers a certain heat. Could we not relax some of our conventional rules for a like reason? Nor need a puggaree necessarily be white: a light grey hue might be used to indicate a professional man. By such

modifications of raiment life might be rendered less intolerable during our brief outbursts of intense heat.

More unfortunate, still, is that civil servant, the police-constable. He must wear clothes which are not liable to be easily torn in a scrimmage, else his prisoners would readily place him *hors de combat* on the score of decency. Then his helmet must be sufficient to withstand a pretty good blow, otherwise it is useless. Now it is not suggested that a supply of cabbage leaves be furnished daily for the force; that might be incompatible with the traditions of Scotland Yard. But something ought to be done to render the regulation helmet less unbearable in hot weather. As to the clothing, of course, there is the argument to be met that a policeman has to go on duty so long at once; that he, therefore, can not run home to put on some more clothes if the heat changes suddenly to cold; but could not garments made of hemp be substituted for the thick woollen cloth in which he is at present clad? A lighter summer suit, of material not easily torn in a fray, yet infinitely cooler than his present uniform, might surely be provided for the force in the day in summer; if the present garments are retained for night-duty. A police-officer is expected to be vigilant and active when on duty, but in order that he may be both, he ought to be clad accordingly. How can he be expected either to be Argus-eyed, or fit to chase a thief, if he is swathed in thick woollen garments under a temperature like that of Bengal.

There are other aspects of the subject which interest all of us; and one is the management of our rooms, and especially bed-rooms in hot weather. It is desirable always to permit as much fresh air as is practicable into bed-rooms. The bed-clothes should be thrown off, and exposed to the air, the denuded bed being thus left to sweeten. Of course, in the heat of the day, the contents of the room become baked. Now this is an advantage; but it becomes a questionable one when the chambermaid comes round at the wonted hour, and shuts down the window, and prepares the room for the night, which she does methodically without regard to the temperature. She shuts up the heated room, and when its occupants come to bed, it feels like an oven. Sleep, of course, is broken, restless, and unrefreshing under these circumstances; even if the windows are thrown open, the heated room cannot cool with its occupants at a temperature of 100°, or perhaps more. Why that useful, but thoughtless domestic cannot keep the windows open when the cooler evening air is coming in, leaving the bed clothes as they are; or if they have been replaced, once more exposing them, and the bed to the air, it is difficult to say: except that the women of British households decidedly object to innovations. If the windows of the shadier side of houses were thrown wide open at sun-down in hot weather, there would be comparative comfort for us all.

The water in the curette is lukewarm, and, therefore, unpalatable. Why can not a thick woollen knitted belt be made, and after being saturated with water, pinned round the bottle, which can then be placed in the draught at the open window; or a pair of worsted stockings would do at a pinch. The evaporation cools the water until a refreshing acceptable draught is attainable. The hotter

and drier the night, the greater the evaporation: so that a very hot night provides a cool draught.

There is still one subject left, which only concerns the comparatively affluent, and that is, a "dinner party" in tropical heat. It is, of course, too much to ask that the fish, the joint, and the puddings, and pastry, be cold; with just the vegetables hot. But is it necessary to keep the windows close shut; to have the waiters closing the door instantly after them, so that not a tangible breath of cooler air can possibly make good its ingress into that heated chamber? That hot-joint shall come up after hot-joint; that the perspiring guests shall feel fainting with heat, and the exhaustion of the oxygen of the room. Yet memory tells us of such experiences, when heat apoplexy seemed imminent, and it became vitally necessary to explain to the hostess some elementary laws about body-temperature, and the requirements of the organism. It is too much to hope that such social torture is no longer to be endured; and that in the hot weather, presumably before us, no series of unhappy guests will have their lives so threatened by ignorance, and a slavish regard to conventionality. But could such torture not be somewhat mitigated by the exercise of a little common sense on the matter.

Why can not the "coesy" be utilised in summer. As a non-conductor of heat, we use it to keep the tea-pot and its contents hot in cold weather. It is just as useful to keep cold water cool in hot weather. Some iced-water is brought up in a glass, or jug, in excess of what is required. It is usually left on the table, first for the ice to melt, and then the water to grow lukewarm. Put the coesy over the vessel, and a draught of cold water is possible several hours afterwards. Where ice is scarce, or costly this use of the coesy is very desirable.

STUDENT-BRIBERY IN THE ROYAL IRISH UNIVERSITY.

THE Academic Council of the University of Dublin at a recent meeting adopted the following resolutions:— "That the unlimited number and high scale of prizes proposed by the Senate of the new Royal University for students in arts or in professional schools is without precedent, and, if legalised, would, in the opinion of the Council, seriously interfere with the interests of the University of Trinity College, Dublin." "That the secretary be instructed to send copies of this resolution to the chancellor, and representatives in Parliament of the University." This expression of opinion by the University of Dublin is at once necessary and timely, and we earnestly trust that it will have its effect upon the leaders of opinion in Parliament. The truth is that by the number and amount of the prizes which the new University proposes to grant it is simply seeking to buy up students at the public expense, and at a price monstrously disproportionate to their value. The Royal Irish University is created to supersede the Queen's University, and to remedy the shortcomings of that institution, and yet we find that its first act is to assume in a tenfold worse form the system of student-bribery which was the opprobrium of that University. This latter institution gives away over £1,000 a year of public money in medals, but these

inducements are a mere trifle in comparison with the scholarships, exhibitions, and other substantial rewards given annually by each of the Queen's Colleges. Every College awards eight junior scholarships in the medical faculty alone, besides a variable number of exhibitions and numerous money prizes, and every medical student might also compete for a great number of similar rewards conferred for proficiency in the Arts course. It was, in fact, stated in Parliament some years ago and, we believe, not denied, that the orders of merit were more abundant than the students, and there was a stock of decorations on hand sufficient to give every pupil of a Queen's College a monetary mark of honour. This system was bad enough—because it held out inducements to boys of low grade socially as well as educationally to seek entrance to the learned professions, and because the educational barrier was not maintained by the University high enough to counteract the evil effect of this system of bribery, and consequently the medical and all other professions in Ireland suffered a decadence of prestige.

The arrangements proposed for the Royal Irish University are a hundredfold worse than this. The scholarships and prizes are to be unlimited in number and stupendous in amount, and the wholesale purchase of students is to be carried on, not, as in the Queen's University, chiefly out of private endowments, but out of the public purse. A student who can maintain a first place (and there may be any number of first places) during his medical studies will receive money, cash down, to the amount of £160, in other words, he will be provided with his whole education gratis, and have £50 in his pocket when he is finished; and honour takers in the second and third classes will receive proportionate emoluments.

We emphatically protest against the allocation of public money to the purchase of medical students, and we unhesitatingly say that a student so bought is worth very little to the public. In our opinion, the student who works simply to get money lacks the quality which would make him a great or even a useful man. If the £160 is to represent its equivalent in honour and in attainments every student obtaining it ought to be examined up to the standard of a wrangler or a University scholar. If not, we insist that it is a gross misappropriation of public money to use it to attract business to an educational institution. The principle of this system of bribery is wrong, the practice of it most injurious to the cause of education; and we earnestly trust that those who have charge of the public purse will see that—in the interest of the Royal Irish University and of the Irish people—it ought to be left to earn its own popularity by the educational prestige which it may deserve.

In the principal foreign cities the rates of mortality, according to the latest official weekly return, were in—Calcutta 18, Bombay 30, Madras 35; Paris 29; Geneva, 22; Brussels 22; Copenhagen 20, Stockholm 22, Christiania 13; St. Petersburg 55; Berlin 30, Hamburg 23, Dresden 26, Breslau 29, Munich 27; Vienna 28; Buda-Pesth 36; Rome 28, Naples 40; Alexandria 43; New York 27, Brooklyn, 19, Philadelphia, 16, Baltimore, 20 per 1,000 of the various populations.

Notes on Current Topics.

Dr. Carpenter on Vaccination.

DR. W. B. CARPENTER has recently published a small pamphlet, entitled "The Truth about Vaccination and Small-pox," in which he puts succinctly before the public the question involved in the long-pending controversy, Vaccination *v.* Small-pox. We would especially commend the reasoning from statistics contained in Dr. Carpenter's little work, and that portion of it wherein he demonstrates the "protective" power exerted on those who are vaccinated. He makes good use, in this connection, of the experiments made by Pasteur with the charbon virus on sheep, and which have been frequently referred to in these columns. The usefulness of Dr. Carpenter's pamphlet is undeniable, and the high authority his name obtains among the general public should assist in inculcating the truths he so earnestly expounds. Dealing with the oft-repeated objections of the anti-vaccinators, he insists on the probability that permanent eruptions, other than actual specific rashes, would have been produced under any circumstances; and in the case of syphilis, he repeats, what in medical circles is so well-known, that its communication to healthy children is very rare. On this same subject, he writes:—"Now that vaccinators are fully aware (which they previously were not) of the importance of only propagating cow-pox from the very healthiest children, it may be confidently expected that they will not again occur. Do we abstain from drinking water, because it is sometimes poisoned by lead; or from making use of chloroform, because, in very rare cases, its administration proves fatal? What we do, is to take all the care we can to ensure the purity of our water-supply; and, if we have occasion to use chloroform for the avoidance of suffering, to have it administered by the most skilful hands." The pamphlet ought to do a large amount of good.

The Sanitary Institute of Great Britain.

At the anniversary meeting of the Sanitary Institute of Great Britain, held in London, at the Royal Institution, on Thursday, July 14th, the Right Hon. Earl Fortescue in the chair, an address was delivered by Prof. F. S. B. F. De Chaumont, M.D., F.R.S., Chairman of the Council, entitled "Modern Sanitary Science," which he divided into four questions:—1st. What are the objects of sanitary science, and on what principles is it based? 2nd. How are those objects to be carried out, and how are the principles to be applied? 3rd. What has been achieved up to the present time? and 4th. What are the prospects for the future?

At the close of the address the Chairman, the Right Hon. Earl Fortescue, called upon Dr. Carpenter to propose a vote of thanks to Prof. F. S. B. A. De Chaumont, M.D., F.R.S., which was seconded by G. J. Symons, F.R.S. Earl Fortescue, in putting the motion, spoke of the pleasure with which he had listened to the address, and fully endorsed the wisdom of the paper, and spoke of the interest he had formerly taken in the sanitary condition of the army. A vote of thanks to Earl Fortescue was moved by

Mr. W. H. Michael, Q.C., and seconded by E. Chadwick, C.B.

The medals were then awarded to the successful exhibitors at the Exhibition held at Exeter Hall in October last, which were as follows:—

Medals to: Mr. Carter, 6A New Cavendish Street, London, for Invalid Furniture. Messrs. Colman and Glendenning, Chalk Hill Works, Norwich, for School Furniture. Mr. Hunt, 43 City Road, Bristol, for his Patent System of Autopneumatic Ventilation. Mr. Moore, Sekford Works, St. James's Walk, Clerkenwell, London, for Gas Louvre Ventilators. Mr. Moser, Southampton, for Dry Closet, suitable for Ashes or Disinfecting Powder. The Sanitary and Economic Supply Association, Limited, Gloucester, for Dr. Bond's Patent Eathermic Ventilating Gas Stove. Messrs. Tylor, J., & Sons, 2 Newgate Street, London, for Patent Flushing Rim Lavatory Basin and Apparatus. Mr. Webb, Worcester, for his method of impregnating wood with colours in patterns. The Wilson Engineering Company, Goswell Road, London, for the Wilson Portable Close Cooking Range. Mr. Bean, Direct-acting Valveless Waste Preventer. Messrs. Doulton and Co., Lambeth, London, Ventilating Tile Stove.

The Silver Medal given by the Exeter Gas Company was awarded to Sanitary and Economic Supply Association, Limited, for Dr. Bond's Patent Eathermic Ventilating Gas Stove.

A large number of certificates for meritorious exhibits were also awarded.

Dr. A. Carpenter, Dr. H. C. Burtlett, E. Chadwick, C.B., Dr. B. W. Richardson, F.R.S., Earl Bathurst, W. H. Michael, Q.C., Rev. E. Wyatt Edgell, B.A., and Earl Fortescue, were among those present.

The Linacre Professorship, Oxford.

THE Linacre Chair of Physiology, vacated by the lamented death of Dr. Rolleston, will, it may be hoped ere long be filled by the appointment of a successor to the late holder. That a more worthy occupant can be found is impossible; but that Prof. Huxley, who is announced as a candidate for the post, will be at least no unworthy follower of Rolleston must be admitted. The stipend attached to the chair is £800 per year, out of which, however, a demonstrator has to be partly paid, to the extent of £200. The new professor, it may be anticipated, will be elected by some one or other of the Colleges of Oxford to a fellowship, the income from which will go to augment the income of the professorship. Whether, with this addition, the temptation will be sufficiently great to a person of Professor Huxley's eminence, remains to be seen. It must not be forgotten that the duties of the Linacre professor include the delivery of twelve lectures in the University Museum of Oxford in each of the three terms of the academical year (the two short summer terms being reckoned one), and that the other duties are not entirely imaginary. That the influence of the great English biologist would react for inestimable good on Oxford, and on the progress of science in this country, cannot for a moment be doubted, and on every ground we trust the rumour of his candidature may be correct.

The Presidency of the Royal College of Surgeons, England.

THE choice of the Royal College of Surgeons in respect to its principal official, fell, on Wednesday last, as we have insisted that it should, on Mr. Erasmus Wilson, the eminent dermatologist, and we only echo the feelings of

the great majority of the profession, in congratulating Mr. Wilson upon his elevation to the presidency,—an appropriate reward for a long life of usefulness to the profession and the College. That anyone more capable or more interested than the successful candidate could have been chosen will certainly occur now to no one to suggest; and certainly to no one could the duty of worthily maintaining the honour and dignity of the College of Surgeons during the approaching Congress have been entrusted. Mr. Wilson has done an immeasurable amount of good to the College over which he now presides, and it should be a matter for general congratulation that he has been chosen to fill the most honourable position on the Council of an institution in whose behalf he has made such considerable sacrifice.

The Royal Academy of Medicine of Brussels.

THE following are the questions proposed by this Academy for competition. 1. Determine the nature of the influence of innervation on the nutrition of the tissues; prize, a medal of the value of £40; essays to be sent in by January 1st, 1882. Determine experimentally the influence exercised by desiccation, employed as a preservative agent, on the simple medicines of the vegetable kingdom; prize, a medal of the value of £24. Show the part played by live germs in the etiology of diseases, based on recent experiments; prize, a medal of the value of £80. Elucidate by clinical facts, and, if necessary, by experiment, the pathogenesis and therapeutics of diseases of the nerve-centres, and principally of epilepsy; £320 sterling. Bónuses of from 300 to 1,000 francs may be awarded to writers who may not deserve the prize, but whose labours may be considered worthy of recompense. A sum of £1,000 sterling may be given, besides the prize of £320 sterling, to the writer who shall have made decisive progress in the therapeutics of diseases of the nerve-centres—such, for instance, as the discovery of a cure for epilepsy. The programme of the competitions for the years 1881-1882 is as follows. Sentin prize for three surgical questions: 1. On the retention of urine studied in its largest expression, from the point of view of its causes and its curative and palliative treatment; the indications, the counter-indications, the advantages of, and objections to, each plan of operation; prize, £20 sterling. 2. On the comparative value of different dressings now used for extensive surgical wounds; prize, £20 sterling. 3. Determine the indications and counter-indications for the various surgical methods applicable to inguinal and crural hernial strangulations of every kind, deriving them from the anatomic-opathological and etiological study of these strangulations, and basing them on a critical and methodised discussion of all the methods of treatment known at the present time; show the advantages of these different plans, as well as the improvements, to which they have given rise; prize £80 sterling.

THE Managers of the Metropolitan Asylums District, under the Chairmanship of Dr. Brewer, paid their annual visit on Saturday to the Asylum for Imbeciles, situate at Caterham. After a thorough inspection the Medical Superintendent and the officers in charge were congratulated upon the excellent condition of the various department and the health of the patients.

A Supposed Cure for Hydrophobia.

M. ROMANET DU CAILLOT recently brought before the French Geographical Society a pamphlet by l'Abbé Lesserteur on the "Hoang Ham," a plant used in Tonquin in cases of hydrophobia, leprosy, &c. This plant, which has been classed by M. Pierre de Saignon among the strychnia, may possibly be of use to explorers in tropical countries. M. Lesserteur gives an account of the cure in Tonquin of the bite of the black viper by means of this plant, and two cases of the cure of the bite of the cobra-capella in India; the bite of the cobra is simply death within the half-hour. M. Feron, missionary in India, writes as follows: "A boy, about 17 years of age, was bitten on the heel by a cobra; in a few minutes his leg swelled as far as the thigh, and in less than ten his sight was completely lost. The first three pills restored his sight and reduced the swelling of the leg to below the knee; two more reduced it to the sole of the foot. At the end of half an hour no pain was felt except that occasioned by the lesion of the tendon achilles, which disappeared on cicatrisation of the wound."

The Health of Dublin for the Past Month.

THE death-rate which was 34·6 per 1,000 persons living in March, and 31·78 in April, fell to 27 in May. In June a further decline to 24·22 took place. The zymotic death-rate which was low in March, April and May, fell below 2 per 1,000 persons living in June. Compared with June, 1880, June, 1881, shows a remarkable improvement. The Report of Dr. Cameron is as follows:—

	1880.	1881.
Ratio of deaths from all causes per 1,000 persons living ...	39·35	23·7
Ratio of deaths from zymotic diseases	11·45	1·96

Comparing the four weeks ended 25th June, 1881, with the corresponding period for 1880, with respect to deaths from the seven principal zymotic diseases and admissions into hospitals, the improved sanitary condition of Dublin is perhaps still more strikingly exhibited.

No. of deaths caused by	June, 1880.	June, 1881.
Small-pox	59	Nil
Whooping-cough... ..	30	2
Measles	31	1
Scarlet Fever	25	6
Fevers	29	26
Diarrhoea	6	5
Diphtheria	5	1
	185	41

The deaths from the seven principal zymotic diseases were less than one-fourth of the number that occurred from these maladies in June, 1880.

Admissions into Hospitals.

	June, 1880.	June, 1881.
Small-pox	248	Nil
Typhus Fever	39	96
Typhoid Fever	19	7
Scarlet Fever	60	10
Measles	90	Nil
	456	113

As compared with May, 1881, there was no increase in the death-rate from typhus fever, whilst there was a great falling off in the number of deaths caused by typhoid fever.

As compared with May, there was a falling off in the admissions of typhus fever and typhoid fever patients.

Disinfection of Clothing, Bedding, &c.

The results of some observations which I have recently made, induce me to suggest that in future no feather beds, hair mattresses, or straw palliasses should be disinfected at the hot-air chamber. The highly-heated air does not penetrate the interior of these articles. In the case of the mattresses, they might still be continued to be disinfected, provided they were first ripped open and the hair fully exposed.

With respect to straw palliasses, I would suggest that those upon which typhus or scarlatina patients (small-pox exists no longer in Dublin) had lain, should be burned and their owners compensated. It would be most desirable to have utterly destroyed these infected masses of straw, which I have no doubt are often the vehicles of contagious disease. The Public Health Committee have given me a general authority to order the destruction of infected clothing and bedding, but I prefer to have the subject of the systematic burning of palliasses specially dealt with by the Committee. If the owners of feather beds and hair mattresses were willing to provide new coverings, the old ones could be removed at the disinfecting chamber, and the exposed hair and feathers might then be disinfected in wire cages.

Killing no Murder.

RED-TAPE, red-coats, and pipe-clay could go no further in wantonness and cruelty than that so recently enacted at Aldershot. When, apparently for a mere love of display, or that of finding a day's amusement for fashionable people, battalions of soldiers were marched out on a sandy desert, and kept out for six hours under a tropical sun, without drink or sup of any kind, that their powers of endurance may be tested; and then, after hours of fatigue drill, marched back again to die of sun-stroke by the way, or in hospital. Is no one answerable to the country for this shocking waste of costly human life? Can no Mr. Holt, so careful of dog and cat life, be found to bring this matter fairly before Parliament, where, up to this moment, there has been a manifest desire to stifle the matter, because, forsooth, a Royal duke might be compromised?

Death of Dr. Mandl.

By the recent death of Dr. Mandl, the science of laryngology has lost one of its luminaries. Dr. Mandl's work on the larynx is one of the best and most complete in the French language, and the coloured illustrations are very faithful representations of the conditions depicted. France has lost several eminent scientific men recently. M. Maurice Raynaud, whose death is also just announced, was to have taken part in the coming Congress.

The Dalrymple Home for Inebriates.

DR. NORMAN KEER has been appointed Hon. Sec. to the Committee of Management of the proposed Dalrymple Home for Inebriates, in succession to the late Mr. S. S. Alford, F.R.C.S. A strong effort is being made to raise the necessary funds for the acquisition and equipment of a suitable house and grounds. It is hoped

that many will testify their appreciation of the late Mr. Alford's devotion by liberally contributing to this undertaking; £5,000 is needed. Donations may be sent to Dr. Alfred Carpenter, J.P., Duppas House, Croydon, Surrey; or to the Hon. Sec., Dr. Norman Kerr, 42 Grove Road, Regent's Park, London, N.W.

Ovariectomy in Cork.

On June 29th, Dr. Macnaughton Jones operated at the County Hospital, on a girl, *æt.* 18. The tumour grew from the left ovary, the cyst contained 23 pints of fluid; there were no adhesions; the pedicle was ligatured and looped and dropped back. On the 10th day the sutures were removed. The case has made an uninterrupted recovery. This is the first successful case of ovariectomy performed in a Cork hospital.

There is another curious case of recovery in the County Hospital from accumulation of pus in the peritoneal cavity. A woman, *æt.* 37, mother of five children, admitted as being the subject of ovarian tumour, but found on aspiration that her peritoneal cavity was full of pus, consequent on pelvic peritonitis coming on after labour. When aspirated the first time 9 pints of pus (10 weeks after labour) were drawn off; and when again, the hyperdistension was extreme, 5½ pints—then Professor Macnaughton Jones made an incision into the peritoneal cavity, with antiseptic precautions, evacuated all the pus, drained by means of a Keith's glass tube, with an India rubber tube attached, into carbolic water. No air was admitted to the peritoneal cavity (the peritoneum was united by sutures to the abdominal parietes), drainage was thus kept up for three weeks; horse hair was then used to keep the opening patent. This woman is nearly well, discharge has almost entirely ceased, her appetite is good and her spirits, and she is anxious to go home.

The Medical Defence Association.

The Council of the Association is making arrangements to hold a representative meeting of the Medical profession at Exeter Hall to discuss the question of medical reform, and to pass resolutions thereon. The resolutions which may be adopted at the meeting will be duly laid before the Royal Commission on the Medical Acts, and it is hoped will have an important influence on the report of the Commission. It is probable that Dr. Richardson, the President of the Defence Association, and Mr George Brown the Honorary Secretary, will be invited to give evidence before the Royal Commission as to the alterations necessary in the Medical Acts to meet the views of the medical profession.

The Hospital for Incurables.

On Saturday last the Duke and Duchess of Connaught opened the new wing of the Royal Hospital for Incurables which is situated at West-hill Putney-heath, the foundation stone having been laid by the Prince of Wales some two years ago. The new wing is a building of two storeys, and comprises female patients' dining-room, assembly-room male and patients' day apartments. After a long inspection of the various rooms which have been constructed, their Royal Highnesses proceeded to the new assembly-room, where the opening ceremony was performed.

About seventy purses, containing sums of money varying from five to ten guineas, were handed to the Duchess as contributions towards the £11,500 required for defraying the building expenses.

A banquet followed the opening ceremony, at which subscriptions (including a donation of 25 guineas from the Duke and Duchess of Connaught) amounting to £526 were announced by the Secretary.

Metropolitan Provident Medical Association.

A MEETING under the auspices of this society took place on Saturday, at Grosvenor House; Mr. Stansfeld, M.P., in the absence of the Duke of Westminster, presided. The object of the Association is to extend to the working classes in every part of London and its environs the advantage of medical treatment, including skilled and tender nursing, and a recommendation to a special hospital where the case requires it. By means of the society members will have a choice of doctors from a duly-qualified medical staff, and whole families may join and insure against the risk of heavy bills, which it is often difficult to pay.—The secretary reported that the Duke of Westminster had taken 500 fully paid-up shares in the company.—The chairman laid before the meeting a *resume* of the objects which the society had in view. The company would have a capital of £50,000 in £1. shares, and wherever possible they would avoid building, but would take over dispensaries as they stood.—Sir A. Allcock moved a resolution approving of the plan of the association.—Sir Sydney Waterlow seconded the resolution, which was adopted.—Another resolution was also carried, declaring that the Metropolitan Provident Dispensaries Joint-Stock Company, Limited, deserves the support of all who are interested in social progress in London. We shall revert to the subject in our next.

A Prize Essay on Insurance.

THE Equitable Life Assurance Society of the United States announces that it will give prizes of £100 to the author of the best essay on the subject named below; and £25 to the author of the second best essay.

Subject: Life Assurance! With special reference to its influence in promoting habits of economy, thrift, and sobriety; and the consequent repression of intemperance, poverty, and crime. Its bearing upon the reduction of the poor rate, the cost of repression of crime, and in stimulating the productive industry of the country; and hence the national benefit conferred on the community in lessening taxation, while giving increased power to pay; and finally, its influence upon our social surroundings, in strengthening family ties, and rendering sacred the home.

The essay is not to exceed, when printed, the length of thirty-two octavo pages of type, to be sent to the undersigned not later than October 1, 1881, unsigned, but marked with a *nom de plume* or number.

A committee consisting of the following gentlemen have consented to adjudicate upon the essays sent in: S. O. Hall, F.S.A.; Cornelius Walford, F.I.A., F.S.S.; Thomas Hughes ("Tom Brown"), Q.C., F.S.A., *Umpire*.

Their award in writing, and the accepted essay, will be public. The name of the authors will not be published without their assent.

The Society reserves the right of awarding a third prize of £10 to any writer recommended by the "Selection Committee," as having produced an essay of merit, although it may not have conformed entirely to the preceding conditions.

"Natural Selection" of the Irish Poor-Law Medical Officer.—"The Survival of the Fittest."

HERE is a specimen of the way that Irish dispensary elections are managed, culled from the local paper.

"Kilkee is exercised on the subject of the election of a dispensary doctor in the room of the late Dr. Rowan. There are two candidates for the vacant situation, each of whom is championed by one or other of the two curates of the parish. On Sunday morning last, one of the curates was about addressing the congregation in sustainment of his favourite, when there was a regular stampede from the gallery of the church, and the gate which had been locked, was broken, the dissentients disappearing from the precincts of the church. Brass bands and canvassing parties are the order of the day.

"*Kilkee Dispensary, Election of Medical Officer.*—The adjourned meeting of the Kilkee Dispensary Committee was held yesterday for the purpose of electing a medical officer for the district. A great deal of interest was attached to the election and a band paraded the town. Coroner O'Donnell presided at the meeting, which was largely attended. Mr. O'Donnell proposed the election of Dr. Hickey. Dr. Studdert was proposed by Mr. Drew. On a division being taken there appeared: For Dr. Hickey, 13; for Dr. Studdert, 11. The result of the poll was received with great enthusiasm, bon-fires being lit, and the town illuminated.

MR. J. H. WHARTON has resigned his post as Senior Lecturer on Surgery in the Ledwich School of Medicine, Dublin.

MR. O'SHAUGHNESSY will on Friday next ask what are the steps necessary to place the Royal University of Ireland—in the words of the eleventh section of "The University Education (Ireland) Act, 1879"—"in a position to confer degrees."

THE Medical Acts' Commission met at 2 Victoria Street Westminster, on the 8th, 9th, and 11th, instant. The evidence of Mr. John Marshall, Dr. D. R. Haldane, Dr. T. S. Byass, and Dr. Edward Waters, was taken. There were present:—The Earl of Camperdown, (chairman), the Bishop of Peterborough, Mr. W. H. F. Cogan, the Master of the Rolls, Sir William Jenner, Mr. Simon, C.B., Professor Huxley, Professor Turner, Mr. Bryce, M.P., and Mr. John White (Secretary).

THE annual rates of mortality last week in the principal large towns of the United Kingdom per 1,000 of the population, were—Portsmouth 11, Bradford 12, Norwich 15, Bristol 15, Brighton 16, Sunderland 18, Salford 13, Leeds 19, Plymouth 19, Oldham 19, Sheffield 19, Edinburgh 19, Dublin 20, Leicester 20, Nottingham 20, Birmingham 21, London 21, Manchester 21, Hull 21, New-

castle-on-Tyne 22, Glasgow 22, Wolverhampton 23, and Liverpool 22.

FROM diseases of the zymotic class in the large towns last week measles showed the largest proportional fatality in Liverpool; scarlet fever in Norwich, Leicester, Nottingham, Sunderland, Edinburgh, and Hull; and whooping cough in Birmingham, Leicester, and Wolverhampton. The 19 deaths from diphtheria included 8 in London, 5 in Glasgow, 2 in Edinburgh, and 2 in Portsmouth. The highest death-rate from fever occurred in Brighton. Small-pox caused 84 more deaths in London and its outer ring of suburban districts, 3 in Liverpool, 2 in Brighton, one in Hull, and one in Newcastle-upon-Tyne; no fatal case was registered in any of the other large towns.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

DR. R. E. CRAINE has been appointed Medical Officer to the Charlestown and Lime-kilns Medical Association, and Parochial Officer and Public Vaccinator for that district.

GLASGOW DEATH-RATE.—The death-rate of Glasgow for the week ending with Saturday the 9th inst. was 23 per 1,000 per annum.

EDINBURGH ROYAL MATERNITY AND SIMPSON MEMORIAL HOSPITAL.—Dr. Keiller has been medical officer on duty at this hospital during the present quarter. He will be succeeded on the 1st of August by Dr. J. Halliday Croom. The Medical Board has elected Mr. Barclay Thomson, M.B. & C.M., and Rodger Kirkpatrick, M.B. & C.M., as house-surgeons for that quarter, in succession to Alexander Bowie, L.R.C.P. & S. Edin., and G. W. W. Ashdown, M.B. & C.M., M.R.C.S.

PROPOSED SOUTHERN HOSPITAL FOR GLASGOW.—Dr. Ebenezer Duncan of Crosshill is most unwearied in his agitation in favour of a hospital and medical dispensaries for the south-side of Glasgow. Unfortunately for the scheme its necessity is an idea not entertained by the great bulk of practitioners resident in this district; while it is felt throughout Glasgow generally, that we have too many hospitals and dispensaries, and that there is far too much gratuitous work done, both for the interests of the profession, and the moral well-being of the public. At a meeting of the Glasgow Town Council held on the 14th inst., Dr. Duncan was the spokesman of a deputation which urged on the council the necessity of the proposed hospital. The Lord Provost assured the deputation that their memorial would receive due consideration, which, after some consideration was remitted to the Parks Committee.

COMBE LECTURE.—The penultimate lecture of this course was delivered on the 12th inst. by Dr. Andrew Wilson, in the Training College, Edinburgh, in presence of a numerous audience. Discoursing on the nervous system, the lecturer explained and differentiated the cerebro-spinal and the sympathetic or ganglionic systems, pointing out the distinction between the nerves and nervous force, and touching upon some of the more remarkable aspects of the subject, such as that of the localisation of thought. Some interesting information was given with reference to the brain. Having mentioned that the average weight of the brain in the adult male was 48 ounces, the lecturer cited the cases of several distinguished men, among them the late Sir James Simpson,

whose brains had exceeded that weight, in two instances, by 15 or 16 ounces, and in the case of Sir James Simpson, by 6 ounces. Intellectual power, however, did not depend on the weight of the brain, but on its quality, which was determined in great measure by heredity. Robert Burns and Sir Walter Scott, judging by their type of head, had not more than the average weight of brain. In cases of idiocy the brain sometimes did not weigh more than 16 ounces. After the age of 40 the human brain decreased in weight at the rate of about one ounce in ten years. The lecture was concluded with an explanation of the functions of the cerebellum.

THE LATE DR. GEORGE S. BLACKIE.—The *American* records the death at Nashville on the 19th of June of Dr. George Stodart Blackie, Professor of Chemistry in Nashville Medical College, and sketches his distinguished career in the country of his adoption. The deceased was half-brother to Professor Blackie, of Edinburgh University, and was born in Aberdeen, April 10, 1834. He graduated with highest honours in Edinburgh University in 1855, and afterwards proceeded to Bonn, at which University he also graduated. He was fond of botanical study, and in 1855 received a gold medal from Edinburgh University for the best herbarium in the University. "The Flora of the Rhine" and "Contributions to the Medical Flora of Tennessee" embody the results of some of his researches in this line of study. In 1856 he visited America, where his reputation had preceded him, and there he was received very warmly, and elected a professor in the University of Nashville. In the following year he settled permanently there, filling the chair of Chemistry and Materia Medica, in the medical department of the University, and also being Professor of Botany in the literary department of that institution until the war between North and South.

Correspondence.

THE INTERNATIONAL CONGRESS OF DOSIMETRIC MEDICINE AT MADRID.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Knowing the interest you take in all that relates to progress, I send you a few particulars of this important gathering, at which I was present.

The first international congress of dosimetric medicine, both human and veterinary, was held at Madrid from May 20th to 25th. It was attended by a large number of Spanish and French physicians, who took a lively interest throughout in the proceedings of the Congress. The Spanish Government being desirous that great publicity should be given to the dosimetric method of treating disease, placed the Congress under its patronage. It instructed its ministers at the various Courts to confer with the Governments as to the appointment of delegates to attend the Congress. In Spain the Town Councils in many cities sent one or more delegates to the meeting, defraying all their expenses. Several European countries were represented by the following gentlemen:—Dr. Lamy and Dr. Felix Paquet, for France; Dr. Arthur Allbutt, of Leeds, for England; Dr. Drotzhe, for Belgium; Dr. Aicardi, for Italy; and Dr. Oliveira Castro, for Portugal. M. Hugot represented the veterinary profession in France.

The Congress being held at the same time as the fêtes of St. Isidore and the Centenary of Calderon, the learned physicians were enabled to combine science and pleasure, and to see the capital of Spain at its best. Great hospitality was shown by the Madrid physicians to their confrères, who were highly pleased with all they saw. Each expressed his opinion that Spanish medical science was on a par with that of other European countries.

On Friday, May 20th the Congress opened with great solemnity. The Spanish and foreign delegates were received at the entrance of the Central University by Dr. Juan Acosta, sub-inspector of the Royal Navy. They were then conducted by the officials of the University to the large and beautiful

hall where degrees are conferred, and precisely at one o'clock the chair was taken by His Excellency the Minister of Public Instruction. His Excellency was supported on the platform by the venerable and illustrious author of the dosimetric system, Dr. Burggræve, of Ghent, Dr. Valledor, President of the Society of Dosimetric Medicine, of Madrid, and other gentlemen. The Hall was crowded by physicians, and by a large number of ladies and gentlemen specially admitted by ticket. M. Chanteaud, of Paris, the founder of the dosimetric pharmacy, also occupied a place of honour along with the learned Rector of the University.

His Excellency the Minister of Public Instruction pronounced a short but eloquent discourse on the value of medical science to the life of man and animals, and dwelt particularly on the advantages of the dosimetric system of medicine in the treatment of disease. He showed that the fostering of medical science should be the first care of all Governments, as upon health depended the welfare of nations. He was followed by Dr. Valledor, who paid a high tribute of respect to the author of the method, the learned Burggræve. He eloquently demonstrated the value of the labours of the doctor to suffering humanity, and showed that the whole system consists essentially in the jugulation or cutting short of disease by means of the most active medicaments, the alkalis, metallic salts, and metalloids.

Dr. Burggræve, who, notwithstanding his 76 years, looked remarkably well, and spoke with great energy and eloquence, then gave an able exposition of his system. He paid a high compliment to the Spanish Government for its liberality in taking under its patronage the Dosimetric Congress. He also referred to the unremitting labours of Dr. Valledor, who for some months had been most active in his efforts to make the Congress a success. He also desired it to be known that without the aid of his friend M. Chanteaud, of Paris, dosimetry would not have been so successful, as it was by his great skill as a chemist and pharmacist that the powerful dosimetric granules had been produced. The learned professor of Ghent concluded amidst great and prolonged applause.

On May 21st the foreign delegates were introduced to Senor Pajares, the Rector of the Central University, and that day, and also on the 23rd and 24th, the members met from two o'clock till six p.m. in one of the faculty halls of the University for the purpose of reading papers and discussion thereon. During the three days many very interesting and practical clinical papers were read by various gentlemen, the most noteworthy by Drs. Paquet and Fontaine, of France; Dr. Arthur Allbutt, of Leeds, England; Dr. Burggræve; Dr. Phipson, of London; Dr. Palanca, of Malaga, and other gentlemen. These papers touched on most diseases as successfully treated by the dosimetric method. Pelagra and its treatment was one of the subjects specially discussed. There was also on the first day a long discussion on homœopathy. Dosimetry, however, was demonstrated to be superior to the mythical system of Hahnemann, and to be allopathy reduced to common sense, and based on clinical and physiological experimentation. All the three meetings were well attended by physicians and students.

On Wednesday, May 25th, the Congress terminated by a grand banquet celebrated at the Hotel de la Rosa. Many distinguished physicians and professors were present at the banquet. The Madrid press and literary society was also represented. The banquet was well served and the toasts were numerous. Dr. Burggræve toasted Spain and Spanish medical science. Dr. Valledor replied well and eloquently for Belgium and the foreign strangers. Dr. Arthur Allbutt replied on behalf of England, M. Chanteaud and Drs. Paquet and Fontaine for France, Dr. Castro for Portugal, besides many other toasts, all of which were most enthusiastically received, with numerous "bravos." The Congress terminated most successfully. Among other attractions the foreign delegates had opportunities for visiting the hospitals of Madrid, the Royal Stables, and other places of interest from a medical point of view. Great results were arrived at from this first great gathering, and a basis was formed for a rational system of medicine. It was proved beyond all doubt that the treatment of disease dosimetrically was superior to the old methods, and that all acute diseases could be successfully jugulated. Acute disease must have an acute treatment; chronic disease a chronic treatment. The more rapid the disease the more rapid the treatment. As the public become educated in rational medicine, disease will not be permitted to enter its

organic stage, but will be jugulated whilst it is still dynamic. The Madrid Congress marks a new era in medical science.

ARTHUR ALLBUTT, M.R.C.P. Edin., &c.
(Late Delegate to the Congress).

24 Park Square, Leeds.
June 14th, 1881.

Obituary.

DR. M. F. WARD.

We announce with much regret the death of this gentleman, best known as having represented Galway in Parliament from the years 1874 to '79. Dr. Michael Francis Ward was a son of the late Timothy Ward, Esq., Merchant, Galway, and of Katherine, daughter of John Lynch, Esq., of Galway; he was born in the year 1845, being, therefore, at his death only 36 years of age; he was educated at the Roman Catholic College of St. Ignatius and the Queen's College, Galway, where he matriculated in 1861. During the brief period of his life which he devoted to the practice of his profession in Ireland he occupied the offices of Surgeon to the Infirmary for Children, Buckingham Street, Dublin, and Curator of the Anatomical Museum of the Catholic University. As a diplomatist he was noted for an unusually vigorous mind and for his great energy and enthusiasm in the political cause which he represented. Had he been able to pursue the promising career in public life which lay before him he would undoubtedly have achieved a first-class position as a diplomatist, but his health broke down, and, after an attempt to recover it in a foreign climate, he died at Demerara, a fortnight since.

Society for Relief of Widows and Orphans of Medical Men.—The Quarterly Court of Directors was held on Wednesday last, under the Presidency of Sir George Burrows. A sum of £1,302 was voted to the 61 widows and 12 orphans now on the list of recipients of grants; the expenses of the quarter were £41 14s. One fresh application was made by a widow for a grant, and her claim was admitted. Two orphans ceased to be eligible through age for any further assistance; one new member was elected, and the death of one reported. It was resolved at the meeting to send a circular to all the medical men residing in the area, comprised between the old and new limits of the society, now extended to an area of all places within 20 miles of Charing Cross.

NOTICES TO CORRESPONDENTS.

J. G.—The work has been undertaken with a view to exposing, and, if possible, removing what has grown to be an intolerable scandal in the practice of medicine. Any information you can tender will be useful, and you need be under no fear that unnecessary publicity will be given to any one connected with the abuse. We had already followed your suggestion, and with good results.

A PUZZLED DOCTOR.—The advice given by your senior was thoroughly sound. It is always best to avoid such contingencies, and when forced on you by circumstances, bow to necessity, but without unduly derogating from the dignity of your calling.

AMNOSITAS.—The article was written by a gentleman who assures us that his only acquaintance with the subject is through channels open to all who will "run and read." A little reflection will convince you how unworthy is the insinuation you stoop to utter. Any criticism you will favour us with shall receive our best attention. But when you write please do so with a flavour of discretion.

A STUDENT.—The meetings of the Congress will be open to students under certain conditions. Apply to the Hon. Secretary-General.

MR. BARCLAY.—Send the cases you mention, and they shall be considered. "Remarks" will of course be desirable, especially since your experience will enable you to discuss the symptoms in the light of their pathology. The influence of alcohol is perfectly understood by *dabblers* in science, but they who have devoted the labours of a lifetime to its study confess ignorance of all but the elementary outlines of the subject. We are disposed to put trust in the latter class of observers.

MR. MORRANT BAKER'S "Two Cases of Sarcoma of the Maxillæ, Removal, Recovery," received with thanks.

MR. HANCOCK.—We have not space to give the list of certificates: the list to whom medals were awarded will be found in another column.

AN INTERESTED ONE.—The list of awards at the International Medical and Sanitary Exhibition at South Kensington is not yet determined on, and will not probably be known before the end of the week.

DR. B.—Thanks, proof will be sent in time for our next.

A STUDENT (Glasgow).—We are much obliged by your note. We

would have preferred the information from yourself, and will be glad of authentic information on the subject from time to time. The "rows" between a certain lecturer, his assistant, the students, and the directors of the infirmary amount to a scandal. Why don't the students memorialise the directors against the re-election of the incompetent lecturers in question? Yes, we understand that the gentleman referred to still lectures to the old women. Nobody ever disputed the eminent suitability of this appointment.

MR. C. E. T.—A note has been made of the circumstance.

ANONYMOUS has forgotten to enclose his card. We cannot deal with matter of such serious import unless the same be substantiated with the name and address of the sender, not necessarily for publication, but as evidence of good faith.

DR. ANGE MACDONALD'S paper "On Calculus of the Female Bladder" is marked for early insertion. The illustration has been duly received with thanks.

MR. ODLING will find the subject fully referred to in another column.

DR. E. C. DUDLEY (Chicago).—Our "Exchange List" is already inconveniently full, sorry we cannot increase it by the addition of your excellent journal.

DR. ALLBUTT.—Sorry you should have cause to complain, but our space has been so much in request that delay was unavoidable.

MR. E. J. W.—Mr. Prescott Hewett was in attendance.

AN ARMY MEDICAL OFFICER.—The list of officers who are to be promoted under the new Scheme of Army Organisation has not yet been completed, but the whole of the arrangements will, we understand, have been made within the next few days, and it is believed that the official announcements will appear before the end of the month. The *Gazette* containing the list will be the most voluminous one ever published by the War Office, and that Department is considering what steps it would be desirable to take to keep it within reasonable bounds.

CALF LYMPEH.—Further correspondence will appear in our next issue.

Vacancies.

Birmingham Queen's Hospital.—Resident Surgeon. Salary, £50, with board. Applications under cover to the Secretary by August 2.
Carnarvon Infirmary, Bangor.—House Surgeon. Salary, £100, with board. Applications to the Secretary before August 11.
Kensington Union, W.—Dispenser for the Workhouse Infirmary. Salary commencing at £120. Applications (forms to be obtained by letter) at the Offices of the Clerk to the Guardians before July 22.
North Stafford Infirmary, Stoke-on-Trent.—House Surgeon. Salary, £120. House Physician. Salary, £100. Each with board. Applications to the Secretary before August 17.
Royal Hospital for Diseases of the Chest, City Road.—House Physician. An allowance at the rate of £80 a year in lieu of board. Applications to the Secretary by July 22.
Stockton-upon-Tees Hospital.—House Surgeon (non-resident, doubly qualified). Salary, £200 per annum. Applications to the Secretary by August 9.

Appointments.

DENHAM, Dr. K. Medical Officer to the Donnybrook Dispensary.
HARTLEY, C. M.R.C.S.E., Medical Officer for the High Easter District of the Dunmow Union.
JEFFERSON, Mr. A. House Surgeon to the York County Hospital.
LUEN, J. R., L.R.C.P. Ed., M.R.C.S.E., Medical Officer to the new Infirmary, St. Marylebone.

Births.

FOURACRE.—July 16, at 20 Tollington Park, London, N., the wife of R. P. Fouracre, M.R.C.S., of a daughter.
HILL.—July 14, at 55 Wimpole Street, the wife of Mr. Berkeley Hill, F.R.C.S., of a daughter.
RAPER.—July 12, at Great Wakering, Essex, the wife of W. A. Raper, M.D., of a son.
WOLSELEY.—July 16, at Castleton, Cheshire, the wife of C. B. Wolseley, M.D., of a daughter.

Marriages.

BAKER—PUDDICOMBE.—July 12, at Silvertown, Devon, Walter Baker, youngest son of the late Emanuel Baker, M.D., of York Place, London, to Eugenia Morgan, only surviving daughter of Edward M. Puddicombe, M.R.C.S., of Silvertown.
HAY—SHEPHERD.—June 28, at the Parish Church, Bridport, W. H. Hay, M.D., to Grace, widow of A. C. Shepherd, of Aakeswell.
WATHEN—EDWARDS.—June 30, at Stoke Bishop Church, near Bristol, John H. Wathen, L.R.C.P.E., of Clifton, to Edith Mary, eldest daughter of Alderman George W. Edwards, of Bristol.
WAUGH—BROWNING.—July 13, at St. Mary's Church, Abergavenny, John Waugh, B.A., M.B., M.Ch., T.C.D., of Toddington, Bedfordshire, to Lilly Lavinia, second daughter of the late S. Browning, Esq., of Abergavenny, Monmouthshire.

Deaths.

ASH.—July 13, at Great Malvern, Adelaide, the wife of John Ash, M.D., in the 44th year of her age.
FLEMING.—July 12, at South Lodge, Champion Hill, London, Dr. J. N. Fleming, aged 52.
GOLDIE-SCOTT.—July 9, at Craigmuir, Kirkcudbrightshire, N. B. Helen Mary Dorothy Goldie-Scott, eldest daughter of the late Thomas Goldie-Scott, M.D., of Craigmuir, Deputy Inspector-General of Hospitals.
ILDERTON.—July 9, at Fairfield, near Manchester, Frederick Walter Ilderton, M.R.C.S.E., M.R.C.P.E., aged 55.

A COURSE OF LECTURES ON THE LAWS OF INHERITANCE IN RELATION TO DISEASE.

Delivered at the Royal College of Surgeons of England, June, 1881.

By PROF. JONATHAN HUTCHINSON, F.R.C.S.,
Senior Surgeon to the London Hospital; President of the
Pathological Society of London, &c.

LECTURE VI.

Small-pox.—At the time when small-pox was a much more common disease than it is at present, there existed a general belief to the effect, that a pregnant woman who contracted variola might communicate the disease to the foetus she was bearing. Although there may exist now a doubt in some quarters concerning the accuracy of this belief, the principle is, nevertheless, well established, that specific fevers may be, and are, communicated from mother to child during the period of gestation. From innumerable observations relating to small-pox infection, there have been deduced an array of facts which have a most important bearing to the student of heredity, and not least among these is that which has proved the variation between the periods of incubation of mother and child, amounting, in some cases, according to Dr. Streeter, to eight or ten days, the demonstration of this lying in the evidence afforded by mother and child respectively, the one presenting the desquamative, the other, the eruptive stage, at the time of birth of the child. During the transfer from mother to foetus, some inexplicable change is exerted over the virus, whereby its influences are modified to the extent of affecting its power to set up its specific effects. The experience of obstetricians in connection with this subject, possesses much interest; and we have the evidence of Morisao, that he was born with small-pox

pustules on his body, his mother having exhibited no signs of being attacked by the disease. On the other hand, there have been recorded several cases in which the children of parents who have had small-pox during their pregnancy, have been born with protection against the disease; and there are other records of twins born under the same circumstances, one of whom has been afflicted at birth with the disease, while the other escaped its influence. The proof that these are veritable cases of intra-uterine affection is further found in the effects of vaccination, which, on one of such twins, will be efficacious, being without result on the other. The intra-uterine protection may lose in effect in time, and instances of this are to be found in those cases where, in children born covered by the scars of small-pox, inoculation is successfully performed early in life; some such cases in which this operation has succeeded in the third or fourth year being related.

Variola may be accepted as the best example of specific contagious fevers; and the facts true about it, may, with much probability of truth, be asserted of all the fevers of which it is a type. Foetal affection through the mother, however, does not always take place as a consequence of the latter contracting a specific fever, but in every case of such transference, the element of time intervening between the period of contagion and the period of exhibition, is of the utmost importance; and particularly so in regard to syphilitic disease.

The *particulate* theory of *syphilis*, that, viz., its transmission is due to the direct carriage of minute particles, as in the exanthemata generally, and not by fluid contact, is that theory alone on which it is possible to explain all the observed phenomena of the disease.

In regard to *syphilis*, certain oft-quoted statistics are too familiar to need repetition, while the enumeration of isolated cases can have no value in determining conclusions bearing on its influence and effects; unusual cases, also, which are interesting in themselves, generally admit of explanation as being fallacious in some important respect; and what will have the greatest weight and weightiest bearing on any inquiry concerning *syphilis* will always be general impressions formed from

widespread experience of large numbers of cases. The conclusions justified on these grounds go to show that, contrary to the opinion formerly prevalent on the communicability of syphilis from father to offspring, it is distinctly heritable, and the child of a syphilitic father and perfectly healthy wife may be, and, in fact, frequently is, born with unmistakable symptoms of primary syphilis, the infection having resided as a *particulata* virus in the male element or sperm cell. In dealing with this question the term inheritance may be advisedly replaced by the expressions "germ-infection" and "sperm-infection," to signify infection of the child through the mother or father respectively, as a consequence of their blood-contamination by the elements of syphilis at the time of impregnation. The process is thus one of real contagion, and the consideration of it is surrounded with all the difficulties that beset the discussion of any ordinary question of contagious infection. In the same way as an adult or other person may escape the influence of contagion in his immediate neighbourhood, so the foetus resulting from a fruitful intercourse between two persons of opposite sexes, one of whom is the subject of syphilis, may escape its influence. A woman, however, who has recently contracted syphilis will bear a syphilitic child, but a distinction must nevertheless be drawn between "germ-infection" and "foetal-infection," the latter being consequent on the mother's contraction of the disease subsequently to conception, the time intervening being immaterial to the result. In such a case the child suffers in the same way as though germ-infection had occurred, the development of the disease being the same in either case, judged by the symptoms observed after birth. This has been proved by numerous observations conducted by Mr. Hutchinson, one case having been watched by him for sixteen years. In this the date after conception at which the mother got her chancre was known to him, and the symptoms exhibited by the child pursued exactly the same course as if it had received the syphilitic taint by direct contact at the earliest possible period. This subject, indeed, is one in which much careful investigation is required, and will repay labour spent on it; and it will be well in connection with it to adopt the term "infantile syphilis" as more appropriate than "inherited syphilis."

The evidence bearing on the fact that the father can transmit syphilis to his offspring is overwhelmingly convincing, and facts have proved beyond all possibility of doubt that children born of a syphilitic father and non-syphilitic mother may be themselves syphilitic. The continuance of an opposite opinion can only be regarded as a survival of the old superstition, to the effect that the office of the male parent during the procreative act is a very imperfect one.

If *both* parents are syphilitic the course of the disease in the child is in no degree more severe, but its occurrence is more absolutely *certain*. Some persons formerly believed that the parents transmitted their disease to their offspring in the same stage at which it existed in them; but this is emphatically contradicted by almost universal experience. It runs the same course in all children alike, though that *younger* children may possibly suffer to a less extent than the older ones in the same family, was an opinion Mr. Hutchinson once entertained, but has modified, in accordance with his observation of cases, to the belief that older children suffer much more *constantly*. Although younger ones, if affected at all, suffer equally with the more senior members of the family.

The confusion of meaning attached to the term "tertiary stage" makes it a difficult matter to discuss the liability to transmission of syphilis in this stage. It may be accepted that the tissue changes initiated when the tendency to cure no longer marks a secondary stage, are *not* transmitted; and more than this it is hardly possible to say, until a consensus of opinion agrees to assign definitive meanings to the expressions, which, used in their present acceptation, vary almost with every observer who employs them to give an account of his investigations.

The effect which syphilis produces on the foetus *in utero* vary within very wide limits. At times its life is entirely destroyed, and abortion results. In the majority of cases, however, the syphilitic virus is absorbed into the body of the foetus, and develops no change in it until a definite period after birth has ensued, this time admitting of incubation of the poison during extra-uterine existence. It is thus unusual for a child to be born with the signs of syphilis actually on it; but such exceptions do sometimes occur, and in the present state of our knowledge it is impossible to account for them. The symptoms ordinarily present are well known; they approximate to those of the secondary stage in the adult, but with a much increased frequency of severe bone diseases, as has been demonstrated by recent researches in England and on the Continent. The distinctions apparently thus set up are only apparent, and as, for example, between rickets in children and bone affections in the adult, are due to the different soil in which the poison is sown in the two subjects.

The confusion, it may be added, which has arisen by associating together syphilis and rickets, is due probably to the common occurrence of the two diseases in young children.

Children born with the syphilitic diathesis may run through the secondary stage, and remain for a length of time perfectly healthy. Then, by-and-bye, changes in their tissues will take place; interstitial keratitis may evidence itself at any time up to thirty years of age. May this be looked on as a fresh outbreak of virus lurking in the blood? Then, again, recovery may ensue, and the body remain subsequently perfectly healthy. This series of events occurs only in such as have been born with the disease present in them; never in the case of those who have *acquired* it. As a general rule, the symptoms of inherited syphilis pass quite into abeyance, first coming quickly to a head. It may coexist with scrofula, psoriasis, &c.; and in such cases it may be cured, leaving the skin disease behind; or it may *simulate* them—a point of great importance in its bearing on the question of treatment.

The latency of the secondary period when it occurs is to be ascribed to the influence of some counteracting remedy; and as it is a very unusual phenomenon, all accounts involving belief in it should be cautiously received, such as those—e.g., in which children are said to be covered with an universal eruption, at a time considerably later than it should have appeared, in accordance with the known laws of syphilis.

The latency of *tertiary* symptoms may be delayed indefinitely, as in the adult; and the occurrence of nodes may be set down as due to a relighting-up of the disease. The nervous system is often, too, affected after prolonged latency, while the resulting condition may be almost indefinitely varied.

The question whether a severe attack of syphilis in the parent will produce a severe symptom in the child is effectually settled. No difference is produced in any way, and the prevalence of the opposite opinion is due to the fact that the child inherits the idiosyncrasies and constitution of the parent, with the syphilis, the course of which may be modified thereby. Also the popular impression that a *recent* attack in the parent affects the child, is true only in so far as it renders the *liability* to infection *certain*. The course run by the disease is precisely the same as if due to an old infection. The difference of degree with which different children are affected is to be ascribed to constitutional peculiarities and idiosyncrasies.

THE thirty-sixth annual general meeting of the Medico-Psychological Association will be held at University College on Tuesday, August 2, under the Presidency of D. Hack Tuke, F.R.C.P. The dinner of the Association will take place at 7.30 p.m., at the Freemason's Tavern.

OVIARIOTOMY.

By NATHANIEL MAYNE,

Surgeon Co. Longford Infirmary.

E. M., *æt.* 25, of healthy appearance, married, had three children, the eldest aged about four years; the second, dead (still-born), born about two years and a-half ago, the youngest now aged one year and seven months.

She "first observed a slight swelling in the left side, about four years ago, accompanied with severe shooting pains." The tumour gradually increased in size till about three months before she sought admission to hospital; for the last two months the increase in size was very rapid; she has not menstruated since the birth of her last child.

On examination, in addition to the usual symptoms of ovarian dropsy, there was a solid mass distinctly felt in the left hypochondriac region, which closely resembled an enormously large spleen. Owing to the rapid growth, the poor woman was most anxious to have the operation performed, which was done on the sixth day of May last. During the operation, any vessels which bled, were at once twisted, consequently there was little or no hæmorrhage.

On opening the peritoneum, I endeavoured to tap the tumour, using "Spencer Wells'" trocar, but owing to the extreme thinness of the cyst walls, the fluid gushed out, causing extensive laceration. Finding that only a small quantity of the contents escaped, I examined, with my finger, the interior of the tumour, which was made up of a number of smaller ones, each of which I opened.

The contents, both in colour and consistency, closely resembled the raw white of egg. A considerable part of the tumour was solid. One portion, that felt externally, was shaped like the spleen, and cutting somewhat like india-rubber. Another part, lying across the spine and right ovary, was of a greyish-black appearance. When removed the tumour weighed ten pounds two ounces; the fluid contents, which were saved in a tub, measured within a few ounces of fifteen quarts. The anterior surface of the tumour was firmly adherent to the peritoneum; the right ovary was healthy.

On raising the tumour out of the abdomen, I tied a strong silk ligature round the pedicle, which was about an inch in length, and cut it off. I then applied a second ligature, tying it with the "Staffordshire knot." The ends of the ligatures were then cut off close, and the stump returned into the abdomen; any fluid or blood being carefully removed with sponges. The surfaces of the peritoneum were then brought together by six fine sutures, the needle being introduced about half-an-inch from the margins of the wound. The external walls of the abdomen were then brought into apposition by four sutures; all the ligatures and sutures were of carbolised silk. The wound was dressed with lint, wet in one in forty solution of carbolic acid. The reaction was prompt. The patient cheerfully expressing her thankfulness at having the operation over, she was put to bed, and had a suppository of morphia *mur.*, half-a-grain, one to be given three times a day. On that evening there was sickness of stomach; she vomited once.

May 7th.—Vomited twice; tongue dry and furred. Pulse 140; temp. 101°; passed a quiet night.

8th.—Slept well; no pain. Pulse 144; temp. 101.2°.

9th.—Vomited once during the day; passed a considerable quantity of wind per anus. Pulse 120; temp. 100°.

10th.—Complains of pain in right hypogastrium; borborigna, anxious, but unable to pass wind per anus. Considerable leucorrhœa and tenderness on passing finger into vagina. Pulse 144; temp. 101.1°.

11th.—Suffered severely from pain during the night; urine scanty and turbid; ordered a turpentine stupe, which she only allowed on for about three minutes. Considerable tympanitis. Pulse 140; temp. 102.3°.

12th.—Vomited twice; passed a considerable quantity of wind, which gave great relief. Pulse 130; temp. 101°.

13th.—On passing up the suppository this morning, I

found the rectum loaded. Considerable tympanitis; uterus greatly enlarged and painful; great sickness of stomach, for which I gave hydrocyanic acid, and bismuth in infusion of calumba. Gave enema of warm olive oil, sixteen ounces, with two drachms each of *spt.* turpentine, and tincture of assafœtida. In about an hour a large quantity of fœces came away. Pulse 144; temp. 100.3°. In evening, pulse 156; temp. 103°.

14th.—During the night there were four semi-solid motions. Feels much better; all unpleasant symptoms relieved; wound perfectly healed; sutures removed. Pulse 136, temp. 100.3°.

15th.—Bowels were moved five times since last night. Gave brandy and egg mixture; also *mist. cretæ co.* with catechu. Pulse 144, temp. 101.2°.

16th.—Bowels moved eight times during the night. Great pain in the right hypogastrium; rubbed over seat of pain a liniment composed of turpentine and *lyn. hydrarg.* (B.P.), equal parts; continue treatment of yesterday. Pulse 136, temp. 100°.

17th.—Diarrhœa continued; evacuations of a dark watery nature, with a considerable amount of mucus; very severe pain and tenesmus, accompanied with distressing vomiting; the intestines greatly distended with flatus; their movements and shapes could be distinctly seen owing to extreme thinness of abdominal walls. Continue liniment; ordered suppository of lead and opium instead of the usual ones of morphia; nourishment, consisting of beef-tea, brandy four ounces, and egg mixture, given by rectum. Pulse 144, temp. 98°.

18th.—Diarrhœa somewhat relieved. Continue treatment. Pulse 144, temp. 100°.

19th.—Suffers severely from great distension of intestines. Diarrhœa checked. Passed a long tube with some difficulty, which allowed some flatus to escape, which was very offensive; gave great relief. Pulse 144, temp. 100.

20th.—Omit liniment; gave sulphate of quinia, three grains in each enema; increased brandy to six ounces. Pulse 152, temp. 101.

21st.—Had nine very liquid motions during the night, accompanied with considerable escape of flatus, which gave very great relief; distension of intestines entirely disappeared; sickness of stomach ceased; expresses herself quite relieved. Pulse 124, temp. 98.

22nd.—Bowels moved twice. From this day temperature remained normal, but pulse ranged from 100 to 125.

27th.—On this morning pulse 132, temp. 100. Complains of great pain and soreness in left side of neck and shoulder. There is considerable swelling, and the glands of that side greatly enlarged. Applied hot poultices, which gave great relief, but the swelling continued for some days.

30th.—From this date the patient rapidly regained her strength, and left the hospital on the 11th June, declaring herself to be in better health than she had been for years.

For several days the patient had nothing but ice, iced milk, and two ounces brandy. From the 17th to the 23rd all nourishment was given per rectum, enemata being given every third hour.

July 22nd.—The patient came to see me this day, and to let me know that on the 13th inst. she menstruated "quite naturally, which seemed to get rid of a load she felt for some days." She is a picture of robust health, and walked from her own home—a distance of five miles.

I have never seen it recommended to join the surfaces of the peritoneum as was done in this case, and did it considering there would be less risk of danger, as pus would not be so liable to enter the abdomen from the external wound, and that there would be less risk of wounding the intestines in applying the sutures in abdominal wall, and that it would be more conducive to the recovery of the patient having the serous surfaces in close apposition. From the date of the operation there was no trace of pus or suppuration.

REMARKS ON DISSOLUTION OF THE NERVOUS SYSTEM, AS EXEMPLIFIED BY CERTAIN POST-EPILEPTIC CONDITIONS.

By J. HUGHLINGS JACKSON, M.D., F.R.C.P., F.R.S.,
Physician to the London Hospital, and to the National Hospital
for the Epileptic and Paralyzed.

(Continued from page 399, last vol.)

SECTION III.—Three degrees of the post-epileptic condition.

In the full and methodical investigation of the condition of patients after epileptic paroxysms we have more than post-epileptic actions to take note of. For there are, in some cases, states "above" actions, in other cases states "below" actions. There is "above" actions an elaborate mental state, or an "epileptic ideation;" there is what we may otherwise name an epileptic "dream," or "reverie," or "dreamy state." The state meant is commonly called an "Intellectual aura." Next in many cases "below" actions ordinarily so-called there are apparently (a) only respiratory, circulatory, and other "vital" or organic operations.

Many examples of the "dreamy state" will be given later. A common one is the feeling which the patient calls variously "reminiscence," "a sort of remembrance," &c. Then, it is admitted by everybody that actions of different kinds and of different degrees of elaborateness follow some epileptic seizures, (b) and it is notorious that after some very severe seizures the patient lies seemingly a mere "vital" mechanism. To anticipate I believe the highest state, the "dreamy state" follows the slightest (c) fits; that the actions follow severer seizures, and that the lowest states in which there are apparently only "vital" operations, follow the severest.

I spoke only of Actions in the general remarks of Section 2, because, so far as I know, the highest states, those "above" actions—and the lowest states—those "below" actions have not been yet considered as having anything in common with post-epileptic actions ordinarily so called, for reasonable comparison and contrast.

Actions are taken count of separately, and usually only violent maniacal actions are considered, although the slight elaborate and merely busy doings after epileptic paroxysms admit of far easier analysis. It is obvious enough that, superficially regarded, the three conditions are vastly different phenomena. But in a scientific investigation we must make the widest comparative study of post-epileptic states which we can methodically do. We must not cut off "Ideation" from the top and "Vital Operations" from the bottom of the scale; this would be too coarse a process of simplifying our subject by ignoring the difficulties which directly confront us.

To resume, there are three degrees of the post-epileptic condition. There is the nascent or incipient perception or action, which we have called Ideation or "dream," (d) abnormal of course, there are actions commonly so called, and there are Vital Operations not commonly called actions. The reader can take this division into three degrees to be an entirely arbitrary one. I hope,

(a) Perhaps the reader will wonder why I use the word "apparently" in this sentence. I use it because I think there is proof that some mental states, or else complex nervous activities corresponding to what in health would be elaborate mental states, continue during very deep coma, and because I have known a few well organised and yet elaborate actions to occur in people comatose, even fatally comatose, from cerebral hemorrhage. The reader is asked to bear this in mind when the word "apparently" is used in similar contexts.

(b) Some physicians believe that an attack of mania may replace an epileptic seizure.

(c) The terms slight and severe are used here rather loosely. They will be defined carefully later on.

(d) Ideation in health or in disease is of course a psychological state. Perception is I submit simply a further development of Ideation, or of part of it. The state called Ideation is a far more complex state than it is popularly taken to be.

however, to show that it is, so far at least as degrees 1 and 2 are concerned, a natural one, that is one answering to the constitution of the nervous system.

That there are degrees, or as we may say sub-degrees, of each degree, is of course not denied; it will be especially insisted on with regard to the second degree, when we come to consider the clinico-pathological explanation of post-epileptic states. Thus in the second degree there are at one end of the scale actions which are very elaborate, and which to bystanders may seem purposive; such, for an example, as laying and lighting a fire in a bread-pan, and at the other end, the patient lies on the floor, sprawling, kicking, and shouting.

The reader is to remember that the physical conditions implied by the psychical states are in all cases the things we have ultimately to deal with. For, manifestly there is no reasonable comparison or contrast to be instituted betwixt the "dreamy state," a state of mind, and the "vital operations when the latter are considered as neuromuscular phenomena as states of body; such comparisons or contrasts are, on any view of the relations of mind to body, grotesque and absurd. Nor do we make comparisons and contrasts betwixt the three conditions superficially. The dreamy feeling of "being somewhere else," such an action as laying and lighting a fire, and the "vital" operations persisting in post-epileptic coma, are manifestly exceedingly different; for all that, we may show, I think, that they signify different "depths" of dissolution. But we have more to say on post-epileptic conditions before this can be attempted.

SECTION IV.—The symptomatic condition in each degree is double.

We have, so far, spoken of the three degrees of the post-epileptic condition as if they were positive states only. There is a negative state with each positive state; in each degree the patient's condition is thus duplex. No explanation of any one of the three conditions is adequate which does not take count of the co-existence of the two absolutely opposite elements. Along with the Ideation there is defect of consciousness; with the actions there is loss of consciousness; with the "vital" operations there is coma.

Thus, in the first degree the patient, who has the "dreamy" state, usually tells us something of his condition, which, rendered into scientific language, means defect of consciousness; for an example, he tells us that he "becomes dim to his surroundings," or if he does not speak so definitely he usually uses some expression more indirectly and yet conclusively implying defect of consciousness. We must note *all* that our epileptic patients tell us as to their state of consciousness in, or at the onset of, their seizures. A patient will say he is not unconscious, and will yet spontaneously give details which show that he is defectively conscious. Thus, after saying that he is not unconscious, he will add with a significant "but," that "although he hears people talking he does not know what they say, or that he does not know where he is, or that he is confused and can't think."

Second degree—That the patient who acts after a seizure has nearly always loss of consciousness is admitted.

Third degree—That the comatose man is apparently out of relation to all but the most uniform of his surroundings is manifest.

SECTION V.—On Nomenclature of the Negative Elements.

There is a difficulty as to the nomenclature of the negative elements to be now considered.

The three degrees of negative affection of consciousness are, in clinical language, Mental Confusion, Insensibility, and Coma. The term loss of consciousness is also a clinical one, and is used synonymously with insensibility in clinical conferences. Literally taken, it means that there is no consciousness left, and implies that there could not be a lower degree of it in coma. It is, in this paper, borrowed from clinical medicine to mean (as one of the three negative states), a negative affection of consciousness standing betwixt defect of consciousness and coma. There is no

other term that I know of than this awkward one, to use here for what clinically seems to be a second degree of affection of consciousness; one which is more than "mental confusion" and less than coma.

The reader may perhaps suppose that there are only two degrees of negative affection of consciousness; defect and loss of consciousness, and that what is in this paper called coma, is simply loss of consciousness, plus paresis, especially of vital organs, or speaking more carefully and precisely, that coma is loss of consciousness, and paresis of vital and other organs, in addition to the paralysis implied by loss of consciousness. Were we to consider the physical side only, we should shirk the difficulty in nomenclature. What is psychically a state of consciousness is physically an adjustment of the organism to the environment, nascent or actual. (a) We could then say that on the physical side in the first degree there was loss of the most special adjustments of the organism to the environment; in the second degree of these and of the more general, and in the third loss of all excepting the most general adjustments. The reader will, I hope, now see what was meant by the statement in the preceding paragraph; "paralysis implied by loss of consciousness." For if the physical basis of consciousness be activity of sensori-motor arrangements effecting adjustments of the organism to the environment, paralysis is implied by all negative affections of consciousness after epileptic seizures at least. The objection that "as a matter of fact" there is no paralysis in most cases of post-epileptic defect or loss of consciousness, but often the very opposite condition, will be considered later on.

We may name these three duplex conditions respectively Highest, Middle and Lowest post-epileptic conditions. They are rudely analogous to healthy dreaming, to ordinary somnambulism, and to deep sleep. They are supposed to be significant of three "depths" of Dissolution, each beginning in the highest nervous arrangements of the Nervous System.

SECTION VI.—*Justification of the Study of the Three Degrees in Relation.*

It seems to me evident that all three degrees should be considered in relation one to another. We may see all three in the same patient in connection with one full paroxysm. At or close upon the onset of the seizure he is defectively conscious and he has the "dreamy state;" next he loses consciousness; when the paroxysm is over he is comatose; there is the third degree, apparently mere vital operations persisting in coma; next, on partial restoration from coma, he begins to act elaborately,—second degree. It may seem that the statement as to the three degrees here (first degree, third degree, and second degree), are inconsistent with other statements made. But it is not really so; for the actions, second degree, ensue in such a case as that instanced when the patient comes round to what we call loss of consciousness; actions ensue, when there is a return to a higher level of Evolution; when, in other words, the Dissolution has become "shallower." Then, if the above is considered to be unsatisfactory, we might take other cases in which there is the dreamy state in or after a very slight fit, the actions after a severer one, and only "vital" operations after one severest. These different degrees are owing indirectly, to differing degrees of severity of the epileptic discharge. The term "severe" is vague, but suffices for the present. What it is to cover will be mentioned later on. (See *Brain*, January, 1881.)

SECTION VII.—*No Dreamy State in Some Cases.*—It is particularly to be borne in mind that it is not asserted that there is ideation ("a dreamy state") at or about the

onset of all epileptic attacks; on the contrary, it is asserted that in some cases there is none—or rather, I would say, some patients remember no dream. Is there, nevertheless, an "unremembered dream" in these cases? Some would doubtless consider an unremembered dream to be equivalent to nothing; or, at any rate, that there is total lack of evidence of the existence of any sort of mental state when the patient, on recovery, remembers nothing.

SECTION VIII.—*On Range of Concomitance of Psychological and Nervous States.*—The question mooted in the last section is not one to be carelessly dismissed as being nonsensical. Whilst accepting the ordinary doctrine that psychological states are different from, and yet concomitant with, nervous states, nothing was said for or against the doctrine of Lewes, that active states of all nervous centres have a psychological side. The question is, how far down in the nervous system there are psychological states during nervous activity. Is the brain the organ of mind, or only the chief part of that organ? I give no opinion on this difficult question. In a footnote to Section III. I have referred to the possibility that if there are no mental states when nothing is remembered, there may be activities of special and complex nervous arrangements of the highest centres, which may issue in special and complex movements of elaborate actions. In other words, the patient who acts after a fit, and remembers nothing on recovery, may, for the time, be a mere mechanism or automaton, without any sort of consciousness. For example, of the man who, after one of his seizures, lay and lighted a fire in the bread-pan, and who knew nothing of it on recovery, the reader may suppose, either that the patient had at the time ideas of the bread pan, of the paper, matches, &c., and some conscious intention, or that there were mere activities of the nervous arrangements, which, had he been well, would have been attended by the conscious states mentioned. When speaking of difficulty of nomenclature, as to degrees of negative affections of consciousness, the very same question was raised. Let me re-state the question:—Mental states have always concomitant physical states—that is, active states, discharges of, or liberations of energy by, nervous elements; but can we say the reverse—that nervous states always have concomitant psychological states? Observe, psychological states are not functions of any nervous elements, but attend the functioning of at least some nervous arrangements of those, at least, by which the most special, &c., adjustments of the organism as a whole to the environment is effected. That consciousness arises during the activity of the highest arrangements (of those by which most special, &c., adjustments are effected) is not disputable. But now comes the question—Is there any sort of subconsciousness or sensibility or any sort of psychological state, however rudimentary, attending functioning of any lower nervous arrangements? And, if this be answered in the affirmative, comes the further question—How low down in the nervous system is the concomitance?

I express no opinion on this most difficult question. But were I to make an abrupt limit to the concomitance of psychological with nervous states I should place the lower limit at the lower Motor (Hitzig and Ferrier,) and lower Sensory (Ferrier's) centres.

The following statements are chiefly anticipatory, and are made now, as it is impossible to write on so complex a subject as the present in simple linear order. The reader is asked to take them on trust for a while.

SECTION IX.—*The Nature of the Negative Elements.*

(a.) *Physically.*—The negative element in the symptomatology is what the epileptic discharge produces; it is the Dissolution, and answers directly to loss of so much. We speak of it further from several different standpoints, but as referring to the highest post-epileptic condition or first degree only. *Pathologically*, it is so much exhaustion (effected by the prior epileptic discharge) of so many nervous elements of the highest centres. *Physiologically*, it is so much loss of function of so many nervous arrangements of the least organised, the continually organising,

(a) It occurs to me that it may be objected that during some mentation, say dreaming, there are no corresponding adjustments of the organism to the environment. According to the dictionary meaning of words this is so, but there are during that mentation, nascent adjustments, discharges of those central elements which were formerly concerned in actual adjustments. Hence the use in the text of the expressions "nascent" and "actual."

centres. *Anatomically*, there is loss of use of so many of the most special and complex sensori-motor arrangements, of those, that is, effecting the most special adjustments of the organism as a whole to the environment. The same remarks apply in principle to the middle and lowest condition; there being in them deeper involvements of the nervous system.

So far, we have spoken variously of the physical condition of the three negative elements; now for their correlative negative psychological condition.

(b.) *Psychically*.—Clinically, according to degree, there is mental confusion, insensibility, or coma. Popularly there is defect in the highest intellectual faculties, or loss of them, or apparently total extinction of all mental faculty. Scientifically we say there is, according to degree, defect of consciousness or loss of consciousness (see Section v.), or coma.

Although we have, in order to emphasize the difference betwixt psychical states, spoken of them separately, yet to prevent the possibility of misunderstanding we will remark further on the difference. It is possible that it may be asked, How can you say that the neuro-muscular phenomena spoken of as effecting adjustments of the organism to the environment, constitute consciousness, or what is equivalent, that the loss of so many of the nervous arrangements which serve in effecting such adjustments is loss of consciousness? The reply is, that nothing of the kind was said; on the contrary, the very simple affirmation was and is made that consciousness *attends* activity of certain nervous arrangements, and ceases when those nervous arrangements are *hors de combat*. That consciousness attends activity of some nervous elements is disputed by nobody. What the nature of the relation is nobody knows; in this paper we speak of concomitance only. To say that those elements are of sensori-motor nervous arrangements adds nothing to the difficulty of the question, and yet clears up much of the difficulty in studying disease.

SECTION X.—*The Nature of the Positive Element.*

(a.) *Physically*.—The positive element is physically activity of lower nervous arrangements, which are, except for over activity, healthy. So that we cannot speak as to the Pathology of the positive element, at least so definitely as we did of the negative element. Yet they are often abnormal from over-activity—healthy except, figuratively speaking, for “insubordination from loss of control;” then the positive condition is hyper-positive. To say of nervous arrangements that they are healthy and yet abnormal is perhaps verbally contradicting. I mean that they are not directly affected by any morbid process; they are no more diseased than the heart and the rest of its nervous system is when it goes faster on cutting the pneumogastric nerve. The discharge has done nothing to the nervous arrangements concerned in the positive state, except in the indirect way of removing control from off them by exhausting their higher, or “controlling” nervous arrangements. Indeed, it will be urged in various parts of this work that elaborate positive mental symptoms are never the direct result, or rather concomitant, of any pathological process whatever, although it may be also urged without any inconsistency that they are always the indirect result of some pathological process. I say “elaborate” positive mental symptoms, because I believe that crude sensations do arise during epileptic discharges. With such exceptions, pathological processes cause directly negative mental symptoms.

SECTION XI.—*The Nature of the Positive Element (continued) Illustrated by a case of partial aphasia.*

Believing that all symptomatic conditions are duplex, I will illustrate the nature of the positive element in a common case, and for simplicity one outside our proper subject. A man from local softening of the brain has that defect of speech which consists in uttering wrong words—he says, for one example, “chair” for “table.” No one objects to the clinical statement that softening “is the cause” of

the defect of speech. But strictly speaking it is simply impossible that softening of the brain can cause any wrong utterances; for softened brain is no brain; so far as function, good or bad, is concerned it is nothing at all. I submit that the wrong utterances occur during activity of parts *not* softened, but healthy. Yet plainly the wrong utterances would not occur if the softening had not happened. The softening answers to the patient's negative condition, to his inability to utter the right words; the wrong utterances are owing to activity of remains of the speech nervous arrangements and hence are abnormal. Similarly the positive elements of the several post-epileptic states are not the direct results of any pathological process. But they would not have occurred had not the negative pathological condition of higher nervous arrangements been established. But it is an abuse of language to say that the negative condition is the cause of the positive phenomena, for that implies that nothing causes something. The positive manifestations are indirectly caused, or rather are “permitted.”

Clinical Records.

CORK COUNTY HOSPITAL.

Under the care of Professor McNAUGHTON JONES,
Surgeon, Cork County Hospital, &c., &c.

(Continued from page 45.)

CASE VI.—*Lipomatous Tumour situated underneath the Latissimus Dorsi Muscle, and over the Lumbar Fascia.*—Prof. Jones removed a lipomatous mass from this situation about the size of the closed fist. Having pretty rapidly formed, and giving a sense of fluctuation, the tumour was aspirated, but no fluid escaping, it was determined to incise the mass. The fibres of the latissimus dorsi were found spread out over the tumour. These were cautiously divided, when the tumour was seen lying on the lumbar fascia, and overlapping the quadratus lumborum muscle. It was readily removed antiseptically with speedy recovery.

Severe Compound Fracture of Joints.—There were several severe cases of compound fracture of joints treated by antiseptic dressings, and put immediately up with plaster of Paris or tripolith, the latter dressing with felt strips giving a light and beautiful support to the joint. All recovered without suppuration, and with good motions. Tripolith is an admirable substitute for plaster of Paris in Sayre's spinal jacket.

CASE VII.—*Tetanus—Treatment by Calabar—Death.* There was one case of tetanus admitted under Prof. Jones' care—a man, æt. 35, admitted ten days after the injury, a crush of the hand, with laceration of the dorsum, caused by a horse falling on him. He was admitted with opisthotonus and trismus. He lived for eight days in hospital, dying ultimately of this terrible affection twelve days after the first appearance of the symptoms. He was at first treated by bromide of potassium and hydrate of chloral. This was afterwards changed for the calabar bean treatment—morphia with calabar bean—but without avail. Most of the cases treated in the County Hospital of late years have been given calabar bean, and the results, save in one case have all been unfavourable.

Pilocarpine in Syphilitic Headache.—In a case of fearful cranial pain due to syphilis, in which there was choking of both papillæ, with blindness of one eye, staggering gait and megrim, cerebellar tumour was diagnosed. The subcutaneous injection of hydrochlorate of pilocarpine (the one-third to half of a grain administered daily) was craved for to afford relief from the violent pain. In another case of double optic neuritis from alcoholic excess, where there was also cranial pain, the subcutaneous injection daily of one-third of a grain of muriate

of pilocarpine was followed by marked benefit, both in the symptoms and the disease itself. There was no bad effect ever noticed. The administration of the drug was followed by the usual physiological effect.

Removal of Half the Tongue for Epithelioma at the Base.—A pensioner, admitted on July 2, for an extensive epitheliomatous patch extending to the base of the tongue, and involving the left side for half its extent. Prof. Jones removed half the tongue on July 4. The cheek was divided as far as the masseter, and a ligature passed through the flaps to hold these well apart. The gag was then applied, and a ligature passed at either side of the raphe at the tip of the tongue. These ligatures were useful in holding the separate halves apart, as the tongue was divided. This was done under bichloride of methylene. The remainder of the operation was continued without any anæsthetic. The tongue was cautiously divided from tip to base with a scalpel and a blunt-pointed scissors. The vessels (some of which bled freely), were secured by torsion, only one ligature to a large vessel at the base of the tongue being applied. The base was then secured with the ecraseur wire, when all bleeding was controlled, and the remainder of the operation was bloodless. The patient is doing well.

Aneurism of the Inominate and Subclavian Arteries Treated by Iodide of Potassium Internally, Milk Diet, Subcutaneous Injection of Ergotine, Ice to Tumour—Consolidation—Relief.—Patient, a corn porter, admitted on November 6, 1880. No history of syphilis; addicted to drink. Traced the source of his illness to a fall of a bag of corn on the right shoulder some months previously. He complained, on admission, of pain shooting down the arm, and intermittent pain in the shoulder. The tumour involved the manubrium, the cartilages of the first and second ribs, intruded into the episternal notch, and pressed forward the sternal end of the clavicle, luxating it, and displacing the sternal origin of the sterno-mastoid muscle. The tumour pulsated; there was a visible heave of the entire mass, and a hard systolic bruit. The tumour was equally expansive in all directions. The skin over the most prominent part of the tumour was red. The right radial pulse was not as full nor as strong as the left, and the carotid of the right side pulsated more feebly. There was cough, hoarseness, and some dyspnoea; there was no dysphagia, no inequality of the pupils, though before he left hospital a distinct periodical inequality was recorded. The treatment while in hospital might be summed up thus:—Absolute rest in bed. Milk diet, principally with fowl broth and dry bread. Iodide of potassium increased gradually to fifteen grains every fourth hour, day and night. Injection of ergotine (three to five grains of ergotine with glycerine and water to ten minims), first into the deltoid, then into the immediate neighbourhood of the tumour, every day; ice kept constantly to the tumour. This treatment was continued until December 7, when the patient left hospital, insisting on going out, as he felt so much relieved. He returned to his work, and is, we believe, employed at it ever since. Though the skin was red on admission, and there appeared some danger of rupture of the sack, the ice was constantly kept applied, save on a few occasions when it was being renewed, the patient rather liking its application. The tumour became gradually firmer and distinctly smaller; the visible heave disappeared, and the pulsation was much less. He lost the cough and the hoarseness. Mr. Sandford saw him six weeks after leaving hospital; he was not disimproved, continuing at his work without inconvenience.

Catarrh of Middle Ear—Suppuration—Perforation of Membrana Tympani—Arrest of Discharge—Cerebellar Abscess—Death.—In the Cork Fever Hospital there was an interesting case admitted as fever, but with an old history of catarrh of the middle ear. The discharge had lately ceased. The patient complained of violent pain in the occipital region, which continued all through the illness. She had jerkings of the right leg and right arm; spasmodic and convulsive movements of the muscles of

the right side of the face, which threw it occasionally into violent contortions. At times she would scream loudly and call out for relief from the pain of her "poor head." Professor Jones looked on the case from the first as one of cerebellar abscess of the left side of brain. The post-mortem examination, made with the resident, Mr. Blair, and myself, confirmed the diagnosis. There was a perforation of the drum; the middle ear was full of pus, which also was found in the labyrinth. There was a large abscess involving the right lateral hemisphere of the cerebellum, the peduncle, and crus. The patient died comatose.

[I have to thank Mr. Arthur Sandford for the brief synopsis of these cases, more complete particulars of some of which, with some other very interesting cases that have lately passed under observation, I hope shortly to furnish.]

JEFFERSON MEDICAL COLLEGE HOSPITAL, PHILADELPHIA.

A New Method of Operating for Phimosia.

Under the care of Dr. R. J. LEVIS.

Reported by H. AUGUSTUS WILSON, M.D.

At a recent surgical clinic, held in the Jefferson College Hospital, Dr. Levis showed the class his new procedure in the operation for phimosis.

The accompanying cut illustrates the instrument devised for the purpose. It is four inches long, and somewhat resembles the ordinary mathematical dividers or compasses. The legs have blunt terminations, and on their outer surfaces, for a distance of an inch and a half, are deeply serrated, with teeth set backward, to prevent the mucous membrane from slipping when traction is made. By means of the thumb-screw the blades are forced apart and retained in that position throughout the operation.

The method of using the instrument is to insert it closed within the prepuce, passing it well up to the corona of the glans. By turning the thumb-screw the blades are widely separated, thus making tense the mucous membrane. Traction is then made upon the instrument, and at the same time the outer elastic skin is drawn backward, and divided near its junction with the mucous membrane, by a circular sweep of a knife. After division the integument is retracted, exposing to view the mucous membrane beneath, which is then freely cut with scissors quite close to its attachment to the glans, leaving only sufficient to hold sutures. To this stump of mucous membrane the cut edge of skin is attached by three or four points of interrupted suture.

A cord or a few turns of a narrow roller bandage may be tightly applied as a tourniquet around the root of the penis, to render the operation bloodless. Any bleeding vessels may be ligated, but usually the hæmorrhage is not sufficient to render ligation necessary.

The after treatment is the same as after the more ordinary operations.

The method so frequently adopted of removing an equal amount of mucous membrane and skin, or, as is more apt to be done, because of its elasticity, removing an excessive quantity of the normal outer skin, is open to serious disadvantages, which this procedure will avoid. The prepuce, after such operations, instead of lying normally in folds behind the corona, is, as a not uncommon result, stretched too tensely over the body of the organ, rendering erection sometimes painful, often difficult.

The writer has recently seen a case where, as a result of a faulty operation for phimosis, the penis was without integumentary covering for about one-half of its extent, and the organ, thus deformed, was a source of great annoyance to the patient, preventing him consummating a marriage engagement.

The object of this improved procedure is to remove nearly

all of the inelastic mucous membrane, in which structure the constriction generally lies, and to leave as much as possible of the elastic skin to cover and protect the glans penis. The removed and morbidly tight mucous membrane is substituted by the elastic skin, as far as necessary. The ready convertibility of the skin into mucous membrane, and *vice versa*, is recognised in operations about the nose, mouth, and other parts where the skin and mucous membrane are joined. The instrument may be obtained from the surgical instrument makers.

ON PARACENTESIS THORACIS BY ASPIRATION IN ACUTE PLEURISY.

Par Dr. GEORGES DIEULAFOY,

Professeur Agrégé à la Faculté de Médecine de Paris; Médecin des Hôpitaux; Lauréat de l'Institut (prix Montyon).

Translated by C. A. OWENS, M.D., L.R.C.P. Ed.,
L.R.C.S.I., &c.

(Continued from page 47.)

CHAPTER III.

Can the Operation of Paracentesis Thoracis change a Serous Effusion into a Purulent One?

THE transformation of a serous into a purulent fluid is certainly one of the gravest accusations which can be brought against paracentesis. Why, it is said, should a patient be exposed to the dangers of suppuration when the effusion would doubtless be spontaneously absorbed, and why should such responsibility be incurred? This opinion, sustained with talent and ability (Chauffard), is based on facts which are sufficiently numerous to admit of observation. A patient has a large effusion, a puncture is made, and from 2 to 2½ pints of lemon-coloured fluid are withdrawn, which is neither doubtful nor suspected, and which appears, at first sight, to be of standard quality. Two or three weeks elapse, and the fluid is reproduced; another puncture is made, and this time a purulent or putrescent fluid is found, and paracentesis accused of it. Trousseau opposed this accusation strenuously when made by Stokes and Watson. Drs. Potain and Moutard-Martin, with others, whose opinion is of the highest, support Trousseau's verdict. Dr. Vergely, in the course of a discussion at the Medico-Chirurgical Society at Bordeaux, cleverly supported the same views; but the accusation brought against paracentesis exists none the less, the proofs accumulated for its defence not having always seemed sufficient. In fact, the etiological conditions of purulent pleurisy are unknown. We know well that certain pathological states—measles, scarlet fever, and the puerperal state, predispose to serous effusions becoming purulent; we also know equally well that tubercular pleuro-pneumonia is accompanied, but more rarely than was supposed, by purulent effusion; but when we have to penetrate the mysteries of the generation of pus, our knowledge is very limited; and notwithstanding all our foresight, do we not see strong and healthy people develop empyema, while others only have simple pleurisy?

I asked myself whether, by studying the histology of pleural fluids at different periods of their evolution, I should not be able to discover their formation or transformation, and this is what frequently repeated experiments demonstrated. Even the simplest and clearest fluid in acute pleurisy contains, at least, 500 to 600 red corpuscles to each cubic millimetre, whilst the white corpuscles are 15 or 20 times less numerous. There may be counted 1,500, 2,000, or 3,000 red corpuscles in each cubic millimetre without any appreciable modification of the colour of the fluid, a pleural effusion not assuming a pink colour, and not really attracting attention till it contains from 5 to 6,000 red corpuscles to each cubic millimetre.

This accumulation of red corpuscles in the pleural fluid is not caused by the wound of the operation, for I have proceeded as follows:—The No. 2 aspirator needle, having been introduced into the intercostal space decided upon, I aspirate, at first, from 6 to 9 ozs. of fluid, in order to wash out the corpuscles which may have accumulated in the needle during its passage through the tissues, and it is then that a

drop of the fluid is immediately placed under the microscope, and submitted to examination, the enumeration of the corpuscles not being made till 2 or 3 minutes later, in order to allow them to settle. These repeated experiments lead me to believe that any acute effusion, which only contains from 500 to 2,000 red corpuscles to a cubic millimetre is a simple pleurisy, without any tendency to suppuration, while the higher figures of 4,000 to 5,000 red corpuscles to a cubic millimetre nearly always indicate the future purulence of the pleural fluid.

In other words, I believe that empyema begins by being at first a *histologically hæmorrhagic* pleurisy, and in this the pleura follows the general law regulating inflammation of organs and tissues. Here, as elsewhere, the phlegmasia is arrested now at the stage of hyperæmia and engorgement, and now it borders upon that of purulence. Thus, in pneumonia, grey hepatization is always preceded by red hepatization and congestion. A whitlow, and an abscess, only reach suppuration after a period of congestion; and it is the same in pleurisy. It has, like pneumonia, its phase of engorgement, which is generally not exceeded, and in which case the fluid only contains a small number of red corpuscles; but if this stage should be followed by suppuration, the nature and violence of the hyperæmia are shown in the great number of red corpuscles present in the fluid. What is the duration of this initial period? and where does purulence commence? I cannot say, not having sufficient data.

I think, therefore, that an acute pleurisy is destined to be purulent, or not purulent, from its outset. If a puncture be made in the first stage of its evolution, and we rest satisfied with a superficial examination of the fluid, we conclude that we are dealing with an effusion of a simple, serous description, clear and lemon-coloured, while, in reality, it is already histologically hæmorrhagic, and will become purulent in time; and in the same case, if another puncture is made later on, paracentesis is wrongly accused of having transformed a serous into a purulent fluid, without perceiving that the effusion has merely been tapped *at two stages of its evolution*, the operation having nothing to do with the transformation. Therefore, I do not believe in the purulent transformation of a fluid under the influence of the aspirator. I do not allude to those cases, which do exist, where the puncture has been made with dirty needles, perhaps used to empty some purulent collection a short time before; but I mean paracentesis performed under good conditions, and this, I believe, to be perfectly innocent of the purulent transformation of pleural fluids.

Dr. Peter, in a communication which he proposes to make to the Academy of Medicine, gives the results of his interesting observations on the comparative thermometry between the healthy and diseased sides in pleurisy, during the period of effusion, and after the performance of paracentesis. He has noticed that the temperature of the diseased side is raised from some tenths of a degree to one degree, after the operation of paracentesis; and this elevation of temperature is explained by the over-activity of the circulation in those parts where the flow of blood had been absent or incomplete before the removal of the fluid. Dr. Peter then inquires whether this return of the visceral and parietal circulation could not be accompanied by the passage of blood corpuscles into the pleural cavity, and if this might not determine a tendency towards purulence. I think not, for as a matter of fact, when it occurs to me to empty a simple effusion in two or three sittings, the pleural fluid examined after the second and third puncture, contains neither more corpuscles nor more fibrine than it did after the first, a further proof that the distance is great between hyperæmia and inflammation. Paracentesis, in permitting the return of the blood and the sudden resumption of function, causes a temporary hyperæmia, which is shown by an elevation of temperature, which elevation is the more marked, the greater has been the amount of fluid withdrawn at one time, but this state of hyperæmia remains as such, and does not become an inflammation. However, generally, inflammation is not merely an exaggerated congestion, it is something more; it is less a question of quantity than of quality, and numbers of pulmonary congestion never reach pneumonia (pneumonic fever), although if pneumonia itself commence as a congestion, it is a special congestion, I dare not say *specific*! These facts appear to me applicable to pleurisy.

In describing the evolution of pleurisy, and its two phases, I did not intend to exclude the cases in which the pleurisy

is purulent from the first; but ought not this last form, of which little is known, be included in the second pleurisy? As regards the more or less hæmorrhagic fluid which characterises the first period of pleurisy, it has been seen that it is designated *histologically hæmorrhagic* to distinguish it from pleurisies, which are *unmistakably hæmorrhagic* (wounds, cancer, hæmatoma of pleura) which may continue in the hæmorrhagic state, and may be occasionally cured, after one or more punctures, without becoming purulent. Nevertheless, there are cases of legitimate empyema, which commence by being not histologically, but decidedly hæmorrhagic, and I can cite three very recent cases of this. One in a patient for whom I was consulted by Dr. Baret, another in the wards of Dr. d'Heilly, and a third in a patient of Dr. Straus. All this signifies that the history of hæmorrhagic pleurisy is still only in its infancy.

Special.

FRANCE.

[FROM OUR SPECIAL CORRESPONDENT.]

INFILTRATION OF THE PENIS.—At the *Société de Chirurgie* M. Lamelongue related the case of a child, two years old, who was brought to the hospital not having micturated for forty-eight hours, and presenting infiltration of the penis and scrotum. Catheterism practised through an incision made in the canal, the meatus not being able to be discovered, gave the sensation of a foreign body in the spongy portion of the urethra towards the origin of the penis. M. Lamelongue having introduced a small curette extracted a small calculus. The child quickly recovered. An interesting point in this case was that no evil results followed the infiltration. M. Sée believed that these cases were very rare. The calculi were composed of two parts, one central formed of uric acid, the other cortical. They were formed in the kidneys. They were generally congenital. The same member took part in a discussion on the use of the elastic bandage, and gave in succinct detail the cases in which he considered it efficacious. In œdema of the upper or lower extremities, in sero-plastic infiltrations, consecutive to certain diffuse inflammations, in the stiffness of the fingers, the result of phlegmon of the hand, in serous effusion into the joints and in particular hydrarthrosis of the knee, elbow, or ankle-joint, in circumscribed or diffuse phlegmonous inflammation, and in certain wounds, M. Sée found the elastic bandage to give the greatest satisfaction. To avoid accidents compression of the soft parts ought to be gentle so as not to obstruct the circulation. Each turn of the bandage should overlap the preceding one for about an inch; except in certain cases the bandage should be taken off every second or third day. The pressure thus exercised is gentle but continued. The elastic bandage acts again by its impermeability hindering the evaporation of the liquids and maintaining completely humid the surface of the wound, it also acts as antiseptic in hindering the approach of germs.

M. NICAISE stated that grey caoutchouc irritated the surface of wounds on account of the excess of sulphur it contained, so that surgeons have abandoned even in drainage tubes the grey elastic in favour of the black which was purer.

UTERINE THERAPEUTICS.—Recamier was one of the first, if not the first, to employ a therapeutic procedure in the treatment of certain affections of the mucous membrane of the uterus, which consisted in scraping off by means of a curette, which since bears his name, the granulations that formed on that membrane, and thus not only modifying the surface, but provoking speedy cicatrisation. This method to-day in the hands of M. Richet of the Hotel Dieu continues to render the greatest services in the cases of menorrhagia due to granular affections of this organ. Long after Recamier Hebra generalised this method of scraping (*grattage*) in applying it to a number of skin affections, but especially to lupus. The results were satisfactory, and it was remarkable to see how the degeneration of the tissues was completely arrested. But Hebra recommended that the operation should not cease before arriving at the healthy parts. Mr. Vidal, of St. Louis Hospital, has modified this operation considerably, and obtains equally satisfactory results. Instead of tearing

through the softened tissues as Hebra, he scarifies them, in every sense making the linear incisions as close as possible. These little wounds close very quickly and the cicatrix is not visible. The operation can be renewed as often as necessary. M. Trélat employs this same procedure in the treatment of cold abscess. He takes up in totality what is called the pyogenic membrane. Cicatrisation is rapid.

CORROSIVE SUBLIMATE IN URTICARIA.—M. Labbe employs, with success in urticaria, lotions of corrosive sublimate, of which this is the formula: Bichloride of mercury, 15 grains; water, four ounces; alcohol, q. s.

The Mineral Waters of Europe.

(Continued from page 49.)

BELLTHAL.

THIS spring, in the valley of Moselle, is recommended as a light table water.

It contains—

Bicarbonate of sodium	22.54
Bicarbonate of potassium	5.83
Carbonate of magnesium	13.93
Carbonate of calcium	40.13
Chloride of sodium	1.53
Sulphate of sodium	1.10
Nitrate of sodium	0.23
Carbonate of iron	0.12
Carbonate of manganese	0.03
Ammonia trace	
Phosphate of calcium	0.01
Alumina	0.02
Silica	0.30
Total solids	85.78
Free carbonic acid not determined.	

Skeleton Analysis of Half-a-pint (10 oz. fluid).

Total Solids.	Antacids.	Salines.	Purgatives.
5½ grs.	5 grs.	1-10th gr.	1-10th gr.

We cannot recommend this water. It is of an antacid nature, chiefly owing this property to the presence of a rather large proportion of alkaline earths, whilst the presence of ammonia, nitric acid, and phosphates being so well-marked is an objection to its general use as a table water. It deposits on standing a slight sediment in the bottle, which chiefly consists of iron.

WILHELM'S QUELLE.

This is another of the aerated mineral waters of the same character as those lately considered. The spring is situated in a beautiful district, mountainous in the extreme.

Kronberg is the nearest point. The Sauerborn, or mineral spring, gives rise to the name of the valley of Sauerborn. It is an isolated but beautiful spot. "Perchance, when summer heat held sway, the lonely solitude of the spring might be broken by the inhabitants of Kronberg, who came to fill their pitchers at the source." The Wilhelms' Quelle was known as far back as the Sixteenth Century, and at that period was in great request, according to the account of the proprietors. It is mentioned by Tabernae Montanus, a celebrated natural philosopher of his day, in a work published in 1584, at Worms, viz., "The Water Treasury." The spring was first enclosed in 1618. This enclosure was renewed in 1790, and finally improved and rebuilt in 1878. The valley is covered with springs, which gush forth in all directions. Many of these, however, differ much in composition; for instance, there is one strongly chalybeate, and another which is described as being "saturated with salt." The circular issued with this water contains a curious statement. It says, "This is the only table water which contains iron in the peculiar form of the protoxide, being exactly in the same form as the iron contained in the human blood." We should be inclined to say that in mineral waters the iron is invariably in the proto- or ferrous form when in the spring, but naturally becomes oxidised by age. This does not, however, occur so readily in the waters, which are decidedly aerated by carbonic acid gas.

A number of analyses of this water have been made, including one made by Fresenius in 1878. This analysis seems very exhaustive, and is stated to have been partially performed at the laboratory of Wiesbaden. Another has been performed by Prof. Atfield, of London. We give the analysis in this book as based upon their analyses. In Fresenius's report he goes into minute details which the larger quantity of water at his disposal enabled him to determine, but to them we have added a few points from observations made by our own examinations. It contains in the gallon—

Bicarbonate of sodium	5.49
Bicarbonate of lithium	0.30
Carbonate of barium	0.24
Carbonate of strontium	0.02
Carbonate of calcium	29.54
Carbonate of magnesium	6.75
Chloride of sodium	117.53
Chloride of potassium	2.48
Bromide of sodium	0.04
Iodide of sodium	Trace
Sulphate of sodium	1.57
Phosphate of sodium	0.06
Carbonate of protoxide of iron	2.00
Carbonate of magnesium	2.00
Silica	7.00
Ammonia	Trace

Total 175.02

Free carbonic acid gas not determined.

Skeleton analysis of half a pint (10 oz. fluid).

Total Solids.	Antacids.	Salines.	Purgatives.
10½ grs.	2½ grs.	7 grs.	1-10th gr.

The water is perfectly free from nitrogenous organic matter and is highly aerated. We have given the magnesium here as it appears in the Fresenius analysis, that is as being associated with carbonic acid, but this is not strictly correct as it is evident that a small portion of magnesium is associated with the chlorine. To make this change, however, would entirely disarrange the analysis; and it is too small in quantity to merit much consideration.

Wilhelms' Quelle is a very pure table water, strongly saline in its character, which owes its antacid properties chiefly to carbonate of calcium.

PROVIDENT MEDICINE.

THE many difficulties surrounding the means whereby the non-paying patients are now enabled to obtain medical and surgical advice and the medicine they are in need of have been so frequently exposed that they have at length been fully appreciated, and an effort has been made to

MEDICAL PRESS AND CIRCULAR SPECIAL REPORT

ON THE
INTERNATIONAL MEDICAL & SANITARY
EXHIBITION,
SOUTH KENSINGTON.

DRUGS, PHARMACEUTICAL AND DIETETIC PREPARATIONS.

(Continued from page 64.)

THE number of articles designed to meet the requirements, both of invalids and of persons in sound health, exhibited at South Kensington, is very considerable—too much so, in fact, to permit of anything approaching to an exhaustive account to be given of them here. We can only attempt to name and briefly describe the more prominent among them, and those especially to which importance attaches from the influence they are able to exert in a medical sense. Among these we may place

MESSRS. SAVORY AND MOORE, whose beautiful case stands prominently forth as No. 3 in the Western Quadrant, provide an attractive display of pharmaceutical preparations, the excellent qualities of which have earned for this enterprising firm a reputation of world-wide extent. Many of the exhibits will demand notice subsequently, in connection with the surgical instruments and appliances; but we may mention here, as worthy of particular attention, the thin, elegant, *Gelatine Medicated Preparations*, introduced by this firm, and which enable a large number of drugs and remedies to be carried about in the pocket, in a concentrated form. These gelatine squares each contain a known quantity of the particular ingredients, held in the gelatine, of which also a given amount is contained in each disc, thus admitting of accurate measurement in emergency; and for employment as injections in cases of ophthalmic disease, &c., their value cannot be over-estimated. The medicine chests, one of which was specially designed by Messrs. Savory and Moore for the Khedive of Egypt, will well repay examination; as likewise the "Medical Field Companion," which for lightness and completeness is quite unequalled. The *Disinfecting Carbolic Acid Vaporiser* is an ingenious little instrument, which efficiently fulfils the object of its invention. A number of *Fluid Extracts of Drugs* are shown, the perfection of which will at once strike the visitor. And among the prepared articles we would particularly notice the *Essences of the digestive ferments*, the *Infants' Malted Food*, and *Peptonised Fluid Meat*, samples of all these being on exhibition.

BRAND'S SPECIALITIES FOR INVALIDS, this being the title by which the essences and soups, &c., manufactured by Messrs. Brand and Co. are known. These are shown on Stall 104, and include essences of beef, mutton, veal, and chicken, concentrated beef-tea and soups, extracts of beef, &c., and meat lozenges. All these articles have attained a world-wide reputation, which is justified by their excellence, and by the unmistakable value they possess as adjuvants to the recovery of invalids. Of the soups especially may it be said that they combine all the elements essential in a dietetic of this particular nature. They are highly palatable and pleasant, and suited to the most delicate stomach; while they are extremely rich in nutritious material. The essences, which are prepared by Messrs. Brand in a manner that secures the most perfect result yet attained with such foods, are admirably calcu-

lated to assist the efforts of the physician whose attempts are directed to recuperating the energies of his patient. The stall devoted to these exhibits is stocked with an array of samples to which attention may be advantageously directed.

THE AYLESBURY DAIRY COMPANY, No. 112.—The stall containing samples of the products of the Aylesbury Dairy is a most interesting one, and contains several novelties in the way of food stuffs, recently introduced to the notice of the profession. Of these *Artificial Human Milk*, prepared by removing casein from cow's milk, has produced already something like a revolution in the treatment of young children, for whom it is pre-eminently adapted, on account both of its purity and its constant composition. *Koumiss*, too, is now prepared by this Company, in quantities to meet the growing demand for it; and its incomparable excellence as a food in many cases of gastric irritability, during the progress of which all food but it is refused, have caused it to be regarded with extreme favour. The *Peptonised Milk*, also, produced by treating cow's milk with liquor pancreaticus, is an excellent agent for employment by delicate and dyspeptic individuals; and as prepared by the Aylesbury Dairy Company, leaves nothing to be desired. Specimens of the Company's various products can be seen and examined, and the opportunity to do so should not be lost.

KOPF'S EXTRACT OF MEAT AND COMPRESSED FOOD COMPANY.—The articles prepared by the Kopf's Company will be found on Stall 115, where a comprehensive array of the various articles is shown. Perhaps the most interesting of them, because of the wonderful cheapness and excellence combined in them, are the consolidated soups, made up in small tins, each holding sufficient for any ordinary working man's meal, with bread. The essence of beef produces an admirable, invalid's beef-tea; and one article, unique of its kind, the "Exquisite" biscuit, is likely to be appreciated by every one, hale or maimed, who makes trial of it. A noteworthy exhibit of this Company is the series of extracts for travellers, comprising tea, coffee, and chocolate extracts, from which these beverages can be immediately produced by the aid of boiling water. They enable a considerable amount of the substance to be carried in a small space, and are really excellent when tried. Among the ordinary biscuits may be mentioned the *Cooked Beef*, *Essence of Beef*, and *Extract of Beef* varieties, and the *Travellers' Biscuits*, for use on journeys. This Company supplies a useful meat lozenge, in pretty little pocket boxes, which should become popular with railway travellers. The purity and general excellence of all the articles manufactured by Kopf's Consolidated Food Company is one of the chief points in connection with them; and the extreme cheapness of many of their products, in conjunction with their guaranteed purity, makes them one of the most interesting of the foods exhibited.

HOFF'S MALT EXTRACT.—There are two stands in the Exhibition whereat the rival Hoff's Malt Extracts are displayed, No. 190 being that of Mr. Leopold Hoff, who shows a novelty in the shape of an *Extract of Malt Jelly*, to which the highest commendation may be awarded. This article is of a most pleasant taste, and in appearance resembles an ordinary, dark, wine jelly, while by appropriate flavouring the slightest taste of malt can be avoided. The substance being in a highly concentrated form, a small amount is equivalent to a larger quantity of other extract; and there is a freedom from stickiness, while at the same time it is solid, that makes it an eminently pleasant food. As being an agreeable and efficient substitute for cod-liver oil, this form of malt extract should meet with a large share of favour, for it is undoubtedly, in all respects, vastly superior to the other candidates in the market. The same exhibitor shows *Malted Chocolate*, *Candy*, &c., which are all palatable compounds of malt extract.

MESSRS. GALE AND Co. show a large collection of pharmaceutical preparations, many of which are already among the most frequently employed agents of the physician, and all of which are excellent examples of careful and elegant manufacture.

THE MALTINE COMPANY (Limited) have a large collection of the articles for which they are so well-known. The properties possessed by *Maltine* are such as to permit of its being associated with a number of agents, of high value as food stuffs and as remedies. The method by which maltine is manufactured secures for it a superiority, which, it is asserted, no other similar preparation can be said to attain to. The testimony in favour of it is certainly considerable and weighty, and the compounds of maltine exhibited on stand No. 200 are of a kind to excite the most favorable criticism. *Maltine wine* is a very pleasant and useful beverage, containing the important elements of maltine in a very agreeable form; *maltine, with cod liver oil and iodine*, is a very effective preparation which, for children suffering from scrofula or skin disease, affords a most important assistance towards recovery. Constipation, or diarrhoea resulting from imperfect nutrition are readily attacked by *maltine with pepsin and pancreatine*, and for dyspepsia also this preparation is of signal service. A large number of other preparations of this body with other substances may be seen at the stall, and information concerning them afforded to enquirers.

JOHANN HOFF'S MALT EXTRACT.—The malt extract of Mr. Johann Hoff is exhibited in the western arcade, together with the diplomas, certificates, &c., by which Mr. Hoff defends his claims to be the original inventor of the extract. This is a liquid substance which for a long time was the only form in which the malt could be preserved. It undoubtedly does possess very high value as an article of diet, and the medical profession fails not to recognise its merit. Whether, however, other forms of malt extract may not be better suited for the use of invalids, is a subject which experience only can properly test, and it is a matter on which there will ensue the outspoken opinion to be anticipated in any trial of the comparative merits of candidates for public favour. It is to be regretted that any unfriendly rivalry should exist between those who aim at relieving the sufferings of the afflicted, in whatever way; but this should neither prevent us from awarding the honour of discovering the mode of preparation of malt extract, nor blind us to perceiving improvements on the original substance that may be introduced by another than the original inventor. Malt extract is an admirable assistant to the practitioner of medicine, and he is likely to prescribe that form of it most fitted to the case in which he deems it is requisite. Mr. Johann Hoff's extract is an excellent form of the article, and those who do not as yet know it, will do well to make trial of it at the stall on which it is exhibited.

BONTHRON'S DIABETIC FOOD.—Near to Mr. Hoff's stall will be seen a table on which are displayed several samples of bread and biscuits prepared for the consumption of sufferers from diabetes. The manufacturer of this form of bread is Mr. Bonthron, of 106 Regent Street, who has admirably succeeded in producing a palatable and digestible form of gluten bread, which is far superior to the tasteless mass which it used to be the doom of diabetic patients to devour. The biscuits are even attractive in appearance, and made in different forms, the characteristics of which are the varying amounts of gluten and starch they contain respectively. The introduction of these improved aids to the diabetic are a distinct advance, and cannot fail to add very much to the comfort of those who are compelled to eschew starch and sugar in quantity.

DAVIDSON'S COMPOUND COD-LIVER OIL EMULSIONS.—On Stand 205 will be found a number of samples exhibited by Mr. Davidson, of Dundee, and consisting of various

kinds of cod-liver oil emulsions. In them the oil is so treated as to be palatable, easy of digestion, and readily combined with other remedial agents. The formulæ on exhibition include the compound emulsion of cod-liver oil, containing oil, pepsine, and hypophosphite and lactophosphate of lime; oil and quinine emulsion; phosphorised emulsion; and an emulsion containing, with the oil, both phosphorus and quinine. These preparations are evidently well and carefully made emulsions, in which the taste of the cod-liver oil has been effectively hidden. The same exhibitor shows samples of concentrated rennet, which is beautifully clear, and which also is thoroughly reliable.

MESSRS. YOUNG & POSTANS, No. 214, show a number of extremely elegant preparations of granular effervescing compounds of more important medicinal agents. The well-known *citrate of iron, with quinine, strychnine, bismuth, arsenic, &c.*, are all to be found on their stall, and also the phosphorised cod liver oil, in connection with which the firm has achieved an unmistakable success. The *phosphorus emulsion*, and *phosphide of zinc pills* will be found here too, "put up" with carefulness and elegance of appearance, for which Messrs. Young and Postans have achieved a deserved reputation. We may commend to especial notice, however, the effervescing granular compounds named above, and which are a speciality with this firm of manufacturers; and which, moreover, they have brought to a perfection that will excite general admiration, on account both of the elegant appearance they present, and the excellence of the result obtained by their use.

LLOYD'S UNIVERSAL FOOD.—This food, exhibited on stall No. 103, consists of the most nutritious and finest selected cereal grains and pulse, combined with the active constituents of pure fresh malt meal, in such proportions as to render the mixture as nearly as possible chemically identical with the constituents of the human body itself. It is valuable both in health and sickness, and is alike suited to the youngest child, the robust adult, and the weakest invalid. It is quickly and easily made palatable and attractive. This new food possesses certain special qualities which adapt it for breakfast use instead of bread-and-milk or bread-and-butter, while as custard, or with stewed fruit, or as a pudding, it can be highly recommended. It is very nutritious and easily-digested; in all cases of weak digestion, constipation, &c., it may be judiciously administered.

DELACRE'S EXTRACT OF BEEF COMPANY (Limited) have a stand where specimens of their excellent, and now well known preparations are shown. The "extractum carnis" may be described as meat broth from which the water has been evaporated; it contains all the substances from which meat broth derives its special qualities, such as creatin, savcin, the chlorides, phosphates, &c., and includes the principles of meat, except fibrin, albumen, gelatin, and fat.

The salting, smoking, and drying processes are never likely to compete with that of extraction, and even if fresh meat can eventually be brought to England in low temperature chambers, the importance of "extractum carnis" will in no way be interfered with, as it must always be a valuable stimulant for convalescents, and children, and useful to exploratory expeditions, public establishments, travellers and sailors, since pampered cattle have none of that unwholesome fat found on artificially fed beasts, they are especially well adapted for the production of Delacre's "extractum carnis," and as the cost of cattle is very much less in the River Plate than in Australia, the latter country cannot compete in this article with the two great companies of the Uruguay

The Delacre Company claims for its extract that it is carefully and laboriously prepared, and is proved by numerous prize medals received at Paris, Sydney, Melbourne, &c., to be of much value. The burnt taste

common to most extracts has been avoided by this Company by means of certain improvements, whilst nothing but pure distilled water is used in the preparation. The extract contains in each pound all the soluble nutritious constituents of about 36lbs. of best beef, exclusive of bone and fat; and it is perfectly soluble in hot or cold water.

MINERAL WATERS AND BEVERAGES.

THE number of beverages ranged on stalls side by side in the Western Quadrant is a striking testimony of the alacrity with which inventors and manufacturers have responded to the sudden demand for summer drinks which followed the introduction of the well-known Zoedone a few years ago. Some of these have stood the tests of trial very fairly, and may now be reckoned as established in the favour of the public, while others there are, that cannot be said to have yet made themselves very generally appreciated. The qualities of all are so much alike that any separate notice of each is hardly possible. There is a fairly representative show of these articles at the exhibition, and doubtless many new friends will be gained for sundry of them, by the occurrence of opportunities like those now offered for judging the merit they possess. There is the less reason, moreover, for us to enter into a lengthened account of the waters, since the important members of the series have been, or will be, included in the special "Analytical Reports on the Principal Bottled Waters," prepared for the *Medical Press and Circular* by Professor Tichborne and Dr. Prosser James. However, we will briefly draw attention to the following, which were all we observed in this department:—

Harzer Water.—This is among the more recently introduced waters, and possesses qualities which will probably place it in the foremost rank as a table beverage. It is a most pleasant drink, being soft, palatable, and pure to the taste, is reported free from nitrogenous flavour, and to possess a special pungent flavour. For gouty or rheumatic persons it is of great value, and the growing success it is encountering, is a strong proof in favour of its natural claims.

Gerolstein Natural Mineral Water.—This water is a sparkling, bright, and pleasant drink, especially useful when a beverage is required free from any injurious properties, and the absence from it of the soapiness to be found in some waters adds to its excellence for table use.

Apollinaris and Hunyadi János.—These well-known waters need to be only mentioned as being among the exhibits; as are also *Glendowa Water*, a new, sparkling, natural mineral water, which is well spoken of; and *Bellthal Natural Mineral Water*. In the class of medicinal waters we may direct attention to the *Flitwick Water*, obtained from the natural mineral springs at Flitwick, near Ampthill, in Bedfordshire. This water is strongly impregnated with iron, and with sulphate of magnesia and soda, and has been used with much success in cases of neuralgia, scrofula, rheumatic gout, &c. The "Victoria" *Offner Mineral Water*, a powerful purgative, is also here, this water being remarkable for the large percentage of magnesium sulphate contained in it.

Visitors to the Exhibition should not fail to taste a little iced *Vin Sants*, a highly refreshing and pleasant aerated beverage, into the composition of which there enter the hypophosphites of lime, iron, soda, and potash. *Hedozone*, a non-alcoholic manufactured drink, made from distilled water, and of similar composition to Zoedone; *Tverero Champagne*, an aerated effervescent drink, possessing a strong and agreeable flavour of ginger, prepared by the Newry Mineral Water Company.

Mr. BURK, of Stuttgart, shows a case containing specimens of his *Medicated Wines*, the chief kinds being Pepsine Wine, a prepared Greek white wine, *Cinchonic Cocoa Wine*, a combination of cocoa and Peruvian bark, and *Ferruginous cinchonic wine*, which contains one per cent. of ammonia citrate of iron.

We may mention here also the *Limejuice Cordial* introduced by Messrs. FELTOL & SONS, under the name with which their sherry is associated, namely, the "Specialité." This is a delightful preparation of the lime, and is preferable to most other forms for its clear flavour and elegant appearance. It is prepared by the manufacturers both as the plain juice and as the syrup, and in either state it is entirely free from the mustiness which so often accompanies the taste left on the palate after limejuice has been taken.

The MONTSERRAT COMPANY exhibit samples of their limejuice, which has attained a considerable reputation for purity and excellence, and which is fully deserving of the favour in which it is held. The productions of this Company—Messrs. Evans, Sons, and Co., of Liverpool—are so widely known and appreciated, and have, moreover, been fully reported on by us when they first introduced their Montserrat Lime Juice and Lime Cordial to the profession, that further remarks would be superfluous. We need only add that these preparations are as beautiful and as valuable dietetic articles as ever. Those who have been accustomed to use or to prescribe them would do well to retain their allegiance.

SANITARY APPLIANCES AND ENGINEERING.

THERE is nothing, perhaps, which so unmistakably marks the progress made in the last few years in the science of hygiene as do the almost innumerable improvements and inventions devised to meet the demands made in respect of health and convalescence. The requirements of the body are not only understood at the present time, but are so efficiently provided for that, as far as regards the actual appliances at hand to secure the benefits to be derived from pure air, pure water, and pure food, the society of to-day is in a position to which the preceding generations could hardly dare ever hope to aspire. Nor ought we to forget that chief stimulus to that industry which has provided us with so many valuable results, was given by him, to the honour of whose memory the great Exhibition at South Kensington is itself designed. Dr. Parke was pre-eminently the hygienic authority of his age; he was beyond all who lived and worked with him; instrumental in creating that revolution against dirt and disease, of which such sanitary exhibitions as the present are a fitting demonstration. Could he but have witnessed the array of sanitary machines which greets the eye of the visitor to South Kensington, he would rejoice at the advance that has been made, and he would be first to declare that the whole constitutes a splendid illustration of the resources of practical hygiene. We can, with this number, give only a notice of a very few of the exhibits under the heading above, nor can we undertake to do more than point out those objects which have excited our special admiration, or have appeared to be specially adapted to the purposes in view. The number of articles shown is so very large, that, although no one, probably, is not undeserving of detailed notice, yet we are reluctantly compelled to confine our descriptions to the few most important exhibits; and first we will mention the

FILTERS.

Of these there are a good many different forms shown, the *Silicated Carbon Filter Co.* having an attractive array of elegantly shaped and efficient filters on their stall. These filters are simple in construction. The filtering medium is easily cleaned; and there is no portion of the apparatus which can undergo decomposition. The silicated carbon filter is made in an almost endless variety of forms, and can be adapted to any and every requirement; while the prices charged for them are not unreasonably high. The constant supply filter made by this Company can be fixed in the course of the supply pipe, and from it can be drawn either filtered or unfiltered water at pleasure. This costs three guineas, but requires no re-filling or other

attention, and is an admirable adjunct to the water tap of dwelling houses.

Maignen's "Filtre Rapide" is an ingenious instrument by which water can be very rapidly filtered from all suspended impurities. The essential portion of it is a filtering cloth, on the surface of which is deposited the medium employed for filtering the water—*Maignen's Carbo-calcis*—and over which the fluid passes. The simplicity of construction of this filter enables it to be very readily cleansed and repaired, or renewed in fact; and it can also be adapted to the filtration of large quantities of water for immediate use, as by an army while marching. The compactness and lightness of the parts render it extremely portable.

The accompanying figures represent an ordinary form of the filter, entire and in section.

Patent Granulated Carbon Filter.—This, the invention of Major Crease, is the form of filter approved by the Army and Navy Medical Department, and it is claimed for it that it is an unfailling filter, the medium employed being easily cleansed, and capable of regulation, according to the degree of impurity in the water to be filtered. It consists of an especially-granulated carbon, prepared by a patent process which secures to it properties that signally increase its purifying power. It contains 88 per cent. of calcic phosphate, with a little sulphide or oxide of iron, 2 per cent. silicated carburet, and 10 per cent. of carbon. The filters are made in various styles, to meet the necessities of different users, but all, alike, possess the particular merit on which their excellence depend. The filtering material can be purchased at any time, and renewed in the filter, which may thus become practically everlasting.

Maguire's Renewable Animal Charcoal Filter, is among the best of the older forms of carbon filters, and for the greater number of domestic purposes it is as well adapted as any other make. It is also cheap and simple in make, so that it is easily cleansed and renovated.

Doulton & Co. show, on the handsome stall devoted to the display of their wares, the *Manganous Filter* of Dr. Bernay, and also Bailey Denton's patent automatic strating filter. These are admirable filters, and as fitted by Messrs. Doulton in the beautiful pottery manufactured by them, they are especially attractive.

Other exhibitions of filters are, Defries & Sons, No. 433; Henry Chapman & Co., 399; E. and J. Gardner, 398; Hooper and Co., 432, who show compressed vegetable filtering carbons for use by travellers, &c.; Mr. W. Ramsay, 352; Sanitary Engineering and Ventilation Company, 286; the Spongy Iron Domestic Filter Company, &c.

DISINFECTANTS.

The work of rendering pure the water and atmosphere which are so essential to existence, is no small part of the duty imposed upon the hygienist, and in respect to the

latter element, he is often at a loss how to meet and overcome the "dangers of a smell." How much of the disease of large towns is due to the reeking odours engendered in the slums and alleys that disfigure it, only they can tell who are familiar with the sicklied inhabitants of these parts. They, too, can tell how much is done to stay the spread of sickness among the thickly-populated regions by the prompt and judicious use of appropriate disinfectants; and not only in such situations but even in every house the influence of disinfectants is an important—and now well-recognised—one. For use in the sick room *Calvert's Carbolic Vaporiser* is an admirable little instrument, consisting of a receptacle for carbolic acid, which is submitted to a heated iron contained in a box below it. For disinfecting large spaces this instrument is an excellent device, and its smaller sizes will be found of the greatest service in private houses and hospital wards. One thousand cubic feet can be disinfected by the No. 1 size, which vaporises four ounces of the carbolic acid at a time; but for greater spaces larger makes are obtainable. So many diseases have, by experience, been found amenable to the influence of carbolic acid, and this agent has such an important bearing on the proceedings of the surgeon, that the introduction by Messrs. Calvert of this mode of employing it is, indeed, a "happy thought," and one of which the consequences cannot fail to be satisfactory in every way. The soaps and powders containing more or less of the agent, carbolic acid, with which the name of F. C. Calvert is associated all over the world, are too well known to need any notice, all the preparations of this established firm having acquired a well-deserved and lasting reputation for excellence and elegance.

Jeyes' Perfect Purifier is one of the more recent additions to the list of disinfectants. It consists of a preparation of creosote, which is described as non-poisonous and non-corrosive, and for which perfect antiseptic and purifying properties are claimed. The *Jeyes' Sanitary Company* manufacture numerous articles containing the disinfecting body, such as *Sanitary Powder*, *Soaps*, *Wood Preserver*, &c. Samples of these may be seen at the Exhibition, and an account of them obtained.

Sanitas.—The *Eucalyptus globulus* as an air-cleanser had been widely recognised before the inventor of *Sanitas* sought to utilise the principle contained in it for sanitary purposes. The success attending his endeavours, however, has been so well marked that *sanitas* is now a staple article of commerce, and is extensively employed by those who object to the strong odours attached to such disinfectants as carbolic acid, &c. *Sanitas* is a peculiarly agreeable body; it possesses a pleasant, not too penetrating, smell, and is perfectly innocuous, and leaves no unpleasant stain. It is, too, a perfectly reliable agent and preservative, thus being brought into close rivalry with the most important of the subjects by which these properties are possessed. As a preventive against cattle disease of all kinds, and for use as a deodoriser in dog-kennels, &c., *sanitas* has been most successfully employed, and it can be thoroughly relied on for all purposes of disinfection and purification. A large number of toilet requisites are prepared from *sanitas*, and are, many of them, equal to the perfumed soaps, &c., supplied for these purposes. All the compounds of *sanitas* are elegant in appearance and pleasant in use.

Fragrant Disinfectant, manufactured by Hamilton, Long, and Co., Dublin, and exhibited by Messrs. Young and Postans, is a delightful disinfectant, designed for use when the peculiarly oppressive odours emanating from the more ordinary fluids would prove injurious or intolerable. It is completely efficacious as a deodoriser and as a disinfectant, and when employed as a scent, on the pocket-handkerchief, is an effectual preventive against contagion. It is a great improvement, and one that will be successfully employed in the future.

remove them. We have on more than one occasion referred to the Association named the "Metropolitan Provident Medical Association," and have sketched the outline of its design. A recent meeting of this Association was held, when it was declared to be duly before the public as a joint-stock company, the liability of whose shareholders is limited to the amount subscribed by him in respect of the number of one-pound shares held in his name. The funds thus provided are to supply a capital fund of £50,000, out of which it is intended to purchase and fit up as dispensaries in all parts of the metropolis where such an institution would prove of service to the inhabitants. In such cases, as there are already existing institutions fitted in a way to meet the approval of the Association's officers and which can be secured, these will be at once appropriated to the service of the sick poor. In other circumstances new buildings will be erected; and it will be at once apparent that for an undertaking of such magnitude to have any hope of success it must be supported by a considerable capital.

We have previously expressed a conviction that the scheme will be productive of great benefits. There can be no question that a chief objection to the present system of out-door hospital relief is of the worst possible nature; its tendency is towards a wholesale pauperisation of the applicants who resort to it, and any scheme having for its object to create an independent spirit among the sick poor must be attended by an improving influence that will be for the general welfare. The strain that is felt by such institutions as—the London and Guy's Hospitals—are situated in densely populated districts is at times more serious than can be met by the resources of the hospital, and inquiry as to the causes, operating at times like this, will reveal the fact that a considerable proportion of the overflow consists of persons who would have been able and willing during the period of health to contribute something towards laying up for themselves the certainty of treatment when overtaken by illness. The Provident Dispensary Association makes ample provision for the wants of this class of people. By payment of a small regularly-collected sum of money the advantages of skilled attendance will be secured whenever required, and there will be created the very desirable feeling that the labour and time expended on him are *purchased* by the invalid, and are not the gratuitous services granted to non-paying patients. Thus a stronger sense of his own independence will be encouraged in the breast of the subscribing member of the institution; and at the same time there will be on the part of the paid medical officer a sense of responsibility and *claim* on his best endeavours which, from the nature of his services, can never be experienced by the regular hospital physician or surgeon.

We need not again dwell upon the constitution of the association, or the rules by which it will direct its efforts; all the more important of these were detailed in a very recent number of the *Medical Press and Circular*. But it will not be out of place to insist once more on the absolute necessity that the committee shall be guilty of no error of judgment in electing the members of the various dispensary staffs. These will, so the rule defines, consist of some or all of the medical men resident in the neighbourhood of the dispensary. From the list thus

composed the members of the dispensary will be at liberty to select each his own attendant. The payment of these will be determined by the number of visits paid during the year, and in addition those allotted to the duty of periodical attendance as out-patients' physician and surgeon will receive a definite remuneration on account of it. These regulations possess the merit that they do not force any one particular practitioner on a patient, but we consider that all in this direction is not secured when so much is gained even. Why it may be asked may not the patient be permitted a perfect freedom of selection? Be allowed to invoke the assistance of any medical man, who is willing, it must be of course understood, to accept the treatment of the case with the knowledge that his remuneration on account of it will be strictly in accordance with a prescribed rate of payments to be determined at the end of the year, and based on the profits made by the dispensary of which the patient in respect of whom he claims is a member. It may be at once conceded that only by reason of the numbers who will come to him as dispensary patients can a surgeon be adequately remunerated through them; but this will in no way militate against the scheme for freedom of selection, because it will be open to every person to refuse to visit a patient whose residence is at too great a distance to be easily reached. It is probable, however, that ere twelve months' experience of working has been gained by the Association it will see the necessity for modifying several of the rules under which it commences operations; and we venture to think those governing the constitution of its professional staff will first come under review.

For the rest, we hope that the scheme of the Association will be successfully carried through, and that the further intention of extending its operations to the large towns will ere long be fulfilled. That it will be advantageous in its results to the non-pauper poor we cannot doubt, and we wish it now, as we have wished it before, all prosperity.

UTERINE THERAPEUTICS.

THERE are few things more characteristic of an untutored intellect than the propensity to "discover" unlooked-for and startling phenomena, as associated with common-place and trivial causes. Speaking generally, it is a case in which either the intelligence or the veracity is open to the gravest suspicion. That a pernicious and demoralising amount of interference with the genital apparatus of females is chargeable against certain practitioners is likewise a proposition to the truth of which, we are sorry to believe, assent will be accorded by the best men in the ranks of our profession. Etiology is the most vulnerable department of medical science; and next to this comes the alleged influence of remedial agents on perverted function or diseased condition. Too frequently, one property of a given agent is selected, to the exclusion of all its other properties, and this agent, to the exclusion of all agents of the same class, is isolated, and its virtues inordinately and ignorantly lauded, to the extent of obscuring the fractional portion of truth which the philosophical mind alone desiderates. It thus occurs in the science of medicine that, to a great extent, prin-

ciples are lost sight of in the maze of particulars, and the infinitude of cases. Whether the *nimia diligentia* in uterine therapeutics is an outgrowth of the luxuriousness of our age, or a profitable pathological continent discovered by the necessities of physicians who claim this department as their own, we will not presume to say; but this much is certain—in no department of medical science are we more frequently treated with novelties, astounded with the alleged consequences of the most trivial deviation from health, or amazed at the unlooked for efficacy of particular methods of treatment. Ignorant persons and remiss thinkers join heterogeneous and distinguish related qualities merely as they find them accidentally associated or casually separated.

To some extent these views have been suggested to us by the perusal of a remarkable paper in an old and esteemed contemporary, from whom better might reasonably have been expected, "On an Improved Method of Treating Uterine Displacements." We confess we were not prepossessed in favour of this paper by the fact that its author astounded not a few of us recently by his wonderfully successful treatment of certain cases by chloride of calcium, his dissipation of fibroid tumours of the uterus by ergotine, or the inelegant English and bad grammar of the paper itself. On these, however, it would be neither profitable nor pleasant to descant further. We pass, therefore, to the "discovery" which our author has made, which, if it be confirmed, is entitled to rank with the best achievements of an age truly prolific of astounding scientific accomplishments.

That uterine displacements *do* exist few of us will seriously doubt; that they exist to the extent that is so frequently alleged, and exert so pernicious a constitutional effect as uterine pathologists seem to believe, is a totally different question. When a gentleman in general practice states that in the course of two years he has treated over two hundred such cases, amongst which, as he states, were "every form and, I think I may add, every gradation of displacement . . . and . . . confidently assert that in every case great relief was obtained, and in the majority of cases a complete cure was and is the result," various conclusions will doubtless be drawn by disinterested parties. Assuming the accuracy of the diagnosis, &c., all practitioners who have the well-being of their patients at heart cannot fail to be solicitous as to the means by which this remarkable success was achieved, and we are not certain that the majority will not participate somewhat in our wonder when we learned that the remedial agent consisted of an application of a mixture containing "glycerine 80 oz., alum 10 oz., and carbolic acid (without which no modern compound can be perfect) 1½ oz.!" It has been frequently observed in medical science that the elaboration of the theory is the difficulty—with the facts there is none; they come readily enough to hand. So we are presented with a beautiful theory as to the beneficial effects of this mixture, and we confess that, with a mixture containing carbolic acid, it is perfectly refreshing to note that spores are unmentioned! The theory of our learned and astute author runs thus:—"It is well known to gynecologists that glycerine employed on cotton tampons has a most beneficial effect in stimulating the capillary circulation of the uterus and pelvis;

moreover that it acts as a depleting agent, inasmuch that it drains the blood of a certain portion of its watery constituents, by virtue of its great affinity for water." In cases of uterine displacements there is hypertrophy, and the application of this mixture, by depleting the uterus, restores the organ (the long-suffering organ!) to its pristine integrity. The explanation is charming in its simplicity and captivating in its clearness; but it involves one or two propositions the truth of which we would like to see indisputably demonstrated. Admitting that glycerine has an affinity for water—say in a tea-cup—and that uterine displacements are associated with hypertrophy, does it follow that the application of glycerine to an hypertrophied uterus will withdraw its watery constituents from the blood, where they exist in normal affinity with its other constituents, to the extent of diminishing its size, and thus reimposing it in its former position? Supposing a quantity of glycerine applied to the uterus remove its own bulk of the serum of the blood (which we have no hesitation in saying we do not for a moment believe), is the general or local circulation thereby arrested? Is there not sufficient serum remaining in the body to equalise the specific gravity of the blood? But it may be alleged, What matters it if the theory be nonsense if the facts remain? That is exactly what we wish confirmed by eminent obstetricians, and with our experience of the former "cures" of our author before us, our scepticism may possibly be excused.

As a fair specimen of the style and philosophy of our author the following may be quoted, the italics being ours. "Let me now turn to the treatment of versions and flexions of the uterus; and perhaps I may be permitted to remark, *without the slightest wish on my part to exhibit a spirit of boasting*, that I have treated quite a number of cases which, before coming to me, had been subjected to the general routine of pessaries and stems, without deriving any benefit whatever, and *which have*, after a few applications of the tampon, *expressed themselves* as feeling great relief." The details of "a most miserable looking object," suffering from the absorption of fecal accumulations in the rectum," are then given, with the usual gratifying results.

This paper was read before a society of well-educated gentlemen (we fail to find the discussion reported), and as it contains much that seems to us passing strange, we shall be curious to watch whether the culture of Modern Athens will confirm its observations, or treat it with callous and culpable indifference. Meanwhile, for ourselves, we confess to being lost in wonder, if not love and praise, at the therapeutic strides being made in the latter period of the nineteenth century.

In the principal foreign cities the rates of mortality according to the latest official weekly return, were in—Calcutta 19, Bombay 31, Paris 26; Geneva, 26; Brussels 22; Amsterdam 18, Rotterdam 20, The Hague 23; Copenhagen 16, Stockholm 22, Christiania 22; St. Petersburg 56; Berlin 31, Hamburg 22, Dresden 24, Breslau 42, Munich 33; Vienna 31; Prague 37; Buda-Pesth 27; Rome 25, Turin 32; Alexandria 37; New York 30, Brooklyn, 20, Philadelphia, 19, Baltimore, 27.

Notes on Current Topics.

The Health of Ventnor.

It is satisfactory to note that a recent report from the Ventnor Local Board Sanitary Commission shows that town to have benefited by the strictures passed upon its sanitary arrangements, twelve months ago, by Dr. Ballard, medical officer of health. This report shows that all the points complained of by Dr. Ballard have been attended to. A systematic house to house inspection has been carried out, and sanitary certificates have been issued to such as were, in the opinion of the inspectors, in a fit condition to be the habitations of human beings. This proceeding is one that ought to commend itself to every sanitary authority in the kingdom, and it would be well if steps could be taken for invariably insisting on the production of such a certificate by every householder in every parish. The Ventnor Local Board have also adopted a system of ventilation of the sewers in the town, whereby a nuisance formerly experienced, and due to the escape of sewer gas through the house-drains, has been remedied—a very essential requirement where health is to be preserved. A careful examination, further, has been made of all the wells whence any part of the water supply of Ventnor is drawn, and every one which presented any evidence of pollution whatever has been closed by the order of the local board. A suggestion, that this board should in future exact rigid compliance from builders with the rules laid down in respect to the construction of houses, is an admirable one, and if duly carried out, we shall have ample opportunity of applauding the foresight which insisted on its necessity. In every way the Ventnor people, and intending visitors to that place, are to be congratulated on the sanitary enthusiasm of its governing authorities.

Death of Dean Stanley.

EVERY class and every rank of English society has received with unfeigned regret the announcement that the Dean of Westminster is dead. The late Dean Stanley, throughout a long and eventful public career, had never, save, perhaps, on one recent occasion, acted so as to incur the unpopularity that one in his position could hardly hope to avoid at times; and it is no more than the truth to say of him that he was universally beloved by all, from the sovereign to the peasant. The medical profession has cause to mourn in him one who was deeply interested in the promotion of its interests, and who had shown his anxiety for its welfare by undertaking to conduct a special congress service on Aug. 7 next, in Westminster Abbey. Dean Stanley died after about twelve days of illness, erysipelas having brought about the fatal result. The attack was ushered in by vomiting and bilious sickness, to which succeeded, in a few days, slight sore throat, and following this erysipelatous inflammation, which began at the bridge of the nose, and thence extended over the right side of the face. Subsequently the inflammation spread to the left side, and then generally to the scalp and the right arm, reaching to the elbow. Thenceforward the end hastened on, and death supervened on Monday night, the 18th inst., at twenty minutes

to twelve. Sir Wm. Jenner saw the patient in conjunction with Dr. Harper, who was the late Dean's regular attendant, and for whom he entertained a warm friendship. By the wish of the deceased, his last resting-place is beside his late wife, in the Abbey, which was ever the first object in his thoughts, and over which he exercised such constant care.

Provincial Magisterialism and Small-Pox.

A CASE occurred at the Newcastle-on-Tyne Police-court last week which affords a good illustration of the way by which, through magisterial ignorance small-pox may be propagated. The Medical Officer of Health for Newcastle, Mr. H. E. Armstrong, had summoned the parents of a child for permitting him to be abroad while still in a state to convey the infection of small-pox. The evidence that this offence had been committed was conclusive, the affected child having been called in from the road for examination by the officer. It also transpired that the mother made her appearance during the interview, having come into the bar (the house being a public inn) straight from the bedroom in which another child was at that time lying with small-pox. In the face, however, of all this, the magistrates—one of whom, by the way, is a medical man—dismissed the summons, one of them making the inquiry whether Mr. Armstrong changed his clothes after seeing a fever patient, and apparently finding in this an ample excuse for the conduct of the woman, whose curiosity brought her from the bed of a small-pox patient to listen to every chance conversation in the bar of her house. So long as this utter disregard of all sanitary rules is encouraged by magistrates so long is it useless for the most energetic officer of health to attempt to check the communication of disease; and we cannot but regret the great unwisdom exhibited by the Newcastle bench on this occasion.

Royal College of Surgeons of England.

THE receipts of the Royal College of Surgeons from Midsummer day 1880 to Midsummer day 1881 amounted to £16,848 17s. 6d.; fees paid by students on examinations for the primary and pass membership, and fellowship, and dental licence amounted to £13,872 8s. The receipts from rent of chambers adjoining the College, and dividends on stock, amounted to £2,553 9s. 5d. Admissions to council, court of examiners, and of members to the fellowship yielded £168 10s.—a very small sum from the latter in comparison to past years, to be accounted for by the fact of many old members of the college dying off. From trust funds £246 14s. The expenditure for the year amounted to £16,380 13s., the principal item under this head being fees paid to courts and boards of examiners, and members of the council, viz., £6,761 13s. Salaries and wages to the large staff of officers and servants in the three departments (college, museum, and library), £4,076 1s. 2d. Taxes, rates, and diploma stamps cost £1,395 14s. 2d. In the "extraordinary expenditure" there is £112 15s. 2d. for the biennial oration and festival, in addition to £49 5s. 4d. received from that trust fund. The balance at the bankers at Midsummer Day last amounted to £852 19s. 1d.

The International Exhibition.

THE number of persons visiting the Exhibition at South Kensington is said to be far smaller than had been anticipated, a fact for which it is difficult to account. The Exhibition itself is one to attract large numbers of interested sightseers, and to the members of the medical profession it is especially full of objects with which they must be concerned. Though the time allotted for the duration of the show is tolerably lengthy, opportunity should be taken of leisurely inspecting the many exhibits while there exist the facilities for doing so. The interest of the general public in the exhibition is being excited, and it needs only a little judicious advertising to become a universal centre of attraction. For the sake of the many exhibitors, who have gone to much trouble and expense in connection with the affair, we shall be glad to see a much more lively appearance in the Exhibition Courts than they have as yet presented.

The Glasgow Royal Infirmary.

THERE is at present a vacancy in the staff of physicians to this ancient institution, for the filling of which several candidates are already in the field. We have not received the list, and can therefore only mention the claims of the one whose testimonials are before us. It is somewhat difficult to speak of one, for whom there is a feeling of personal friendship, without some apparent show of partiality; nevertheless, in wishing for the success of Dr. Donald Campbell Black, we can truthfully advance in his favour that a more highly educated physician, or a more honourable man in his professional conduct, it would be difficult for Glasgow to select. He has now represented this journal in Scotland for several years, and though at times his language in our columns has been quoted as severe, we believe that in every case the reform of the system he has sought to expose has been the sole object in view.

Imprisonment for not Reporting Infectious Diseases.

THOSE of our profession in Ireland who read that Dr. Oulman, of Brooklyn, *The New York Medical Record* informs us, having refused to pay a fine of 50 dollars imposed on him for failing to report a case of small-pox, has been sent to gaol, will, with good cause, congratulate themselves on their narrow escape from the Bill to extend to Ireland the notification system. The *Record* thinks that the law which compels physicians to report cases of infectious disease, whether they will or not, and with insignificant compensation for the trouble, is arbitrary, and without any foundation in equity. In any case, the prosecution of Dr. Oulman is seriously contradictory of the asseverations of the advocates of the notification system, that, in the happy land of notification, all is harmony and salubrity. The roseate reports of these gentlemen remind us of the "once on a time" when little pigs ran about with knives and forks stuck in their backs crying out, "Who'll eat me?" Too delightful for belief. Upon voluntary notification, the *Local Government Chronicle* has the following observations:—

"Pending any general legislation making the notification

of infectious diseases compulsory, which may be done by the voluntary action of sanitary authorities and medical practitioners. More than one sanitary authority has adopted the practice of paying fees to medical men for certificates. The Dorking Local Board, at the suggestion of their medical officer, Dr. Jacob, have resolved to pay a fee to any medical practitioner who furnishes them with the earliest information of the first case in any house within their district of small-pox, typhoid, or any other infectious disease of a like character. However imperfect the returns may be where the duty of making them is not imposed by law, they are likely, so far as they go, to be of service in enabling the authority to arrest the spread of the disease; and the general adoption of arrangements of this kind, if they prove a success, may be expected to pave the way for general legislation on the subject. It is, however, to be regretted that the fee offered in the above case, and also in that in which it was cited as a precedent, is only *one shilling*.

The Veterinary Surgeons' Bill, 1881,

INTRODUCED into the House of Lords by Lord Aberdare, resembles, *mutatis mutandis*, the Pharmacy Acts. The Royal College of Veterinary Surgeons takes much the same place as the Pharmaceutical Society. No one not registered will be able to recover fees for services rendered as a veterinary surgeon, and an unregistered person using the title veterinary surgeon, or any similar title, is liable to a penalty of £20. Persons who have been practising veterinary surgery for five years before the passing of the Act will be entitled to registration on payment of such fees as the Royal College decides, but only in a separate class as "existing practitioners," and such registration gives no rights to membership of the College.

This Bill, which has passed the Lords, was read a second time last week in the House of Commons, after an appeal by Dr. Lyons for the establishment of a Veterinary College in Ireland, to which Mr. Forster replied that the subject had the attention of the Lord Lieutenant.

The Medical Language of St. Luke.

THE Rev. W. K. Hobart, of Londonderry, an ex-scholar of Trinity College, Dublin, is about to publish, by subscription, a work showing, from internal evidence, that the "Gospel according to St. Luke," and the "Acts of the Apostles," were written by the same person, and that the writer was a medical man. The work consists of an examination of words and phrases peculiar to these parts of the Bible, compared with the use of the same words and phrases in the works of the Greek medical writers, viz.:—Hippocrates, Aretæus, Dioscorides, and Galen.

Amendment of the Sale of Poisons Bill.

A BILL has just been introduced into the House of Lords by the Duke of Richmond entitled the Sale and Use of Poisons Bill, 1881. It extends several parts of the Pharmacy Act, 1861, forbids the sale of a scheduled poison to persons under 21, or to persons representing themselves or known to be servants, under a penalty of £10. Whenever a poison is sold to a servant, a copy of the entry in the poison register must be posted to the master. A false declaration of name, address, or the purpose for which the poison is required renders the purchaser liable to a fine of £5 for the first, and £10 for subsequent offences. The poison register shall be open at all reasonable hours to the

inspection of any justice, constable, or police officer, under a penalty of £10. These provisions are not to interfere with the business of apothecaries, of members of the College of Veterinary Surgeons, nor with the wholesale or patent medicine business. The following poisons are to be added to Part I. of Schedule A of the Pharmacy Act:—Hellebore, butter of antimony, oil of vitriol, spirits of salts, nitric acid, and salts of copper.

Burned to Death by Vitriol.

A MAN, named Sellars, employed as a teamster, met with his death last month in a shocking manner at Farnley, near Leeds. He was in charge of a lorry loaded with 15 carboys of vitriol, in attempting to turn the corner of a road rather sharply, the waggon tilted over. Sellars was knocked down, the carboys broke all around him, drenching him with sulphuric acid. He was rescued as speedily as possible by a bystander, and was found to be shockingly burnt. A portion of the skin and muscles of his left upper arm near the shoulder had been destroyed for some distance, laying bare the bone. The left foot and ankle were similarly destroyed, as were also several other parts of his body. Shock to the system caused by the extensive destruction of tissue caused death in about two hours.

A Medical Malthusian League.

A MEDICAL branch of the Malthusian League has been started in this country with the following objects:—

1. To aid the Malthusian League in its crusade against poverty, and its accompanying evils, by obtaining the co-operation of qualified medical practitioners, both British and Foreign. 2. To obtain a body of scientific opinion on points of sexual physiology and pathology involved in the "Population Question," and which can only be discussed by those possessing scientific knowledge. 3. To agitate for a free and open discussion of the "Population Question" in all its aspects, in the medical press, and thus to obtain a recognition of the scientific basis and the absolute necessity of Neo-Malthusianism.

The Small-pox Epidemic.

THE decrease, both in the number of cases and mortality in connection with the outbreak of small-pox in London, is, we are happy to record, continuing. The number of deaths is now more than 50 per cent. less than it was a month since, whilst the authorities do not relax, in any particular, their vigilance or control. On Saturday last, a deputation from Hackney, where a temporary structure had been erected, waited upon the Asylums Board to protest; but Mr. Howell, and Sir E.J. Currie, met them with such common sense remarks, that the spokesman appeared to be quite taken back. After the usual formalities had been gone through, Mr. Howell wished to know whether the deputation was aware of the fact that in their hospitals, where several thousands of patients had been treated, and where all the nurses and other members of the staff had been re-vaccinated, not one of the attendants, although living in an atmosphere of small-pox, had contracted the disease, and, a reply having been given in the negative, expressed his opinion that that fact ought to be sufficient to allay any apprehension that might be felt

if the people would only protect themselves by re-vaccination.

Sir E. H. Currie said that of 32 patients now on board the *Atlas*, 50 per cent. of those from Hackney were unvaccinated. Sir E. H. Currie further said that before the site was purchased by the Metropolitan Asylums Board it had been used as a dust yard, and had in its centre an undrained w.c. Will the fact that 50 per cent. of the patients from Hackney were unvaccinated, or that awkward fact for anti-vaccinators, that not a single attendant, although breathing an atmosphere of contagion in the small-pox hospitals, without contracting the disease, be sufficient to satisfy the public that the remedy is in their own hands.

International Pharmaceutical Congress, 1881.

THE following is the programme, as far as it has been at present arranged by the committee appointed to organise it:—

Monday, August 1, 11 A.M. to 4 P.M., with adjournment of one hour for luncheon at one o'clock.—Address of welcome by the President of Pharmaceutical Society of Great Britain. Election of President, Vice-Presidents, and Secretaries of Congress. Reading and discussion of papers. The executive committee will make arrangements to take the guests for an excursion down the river Thames.

Tuesday, August 2, 11 A.M. to 1 P.M.—Reading and discussion of papers. 2 P.M. to 4 P.M.—Presentation of the Hanbury gold medal to Professor Flückiger, who is expected to be present. Reading and discussion of papers. Banquet at Willis's Rooms at 6.30 for 7 P.M.

Wednesday, August 3, 11 A.M. to 1 P.M.—Reading and discussion of papers. 2 P.M.—Concluding business of Congress. Address from President of Congress. The arrangements for the evening of Wednesday are not yet complete.

Thursday, August 4.—An excursion from Henley to Maidenhead by water, including, it is hoped, a visit to Cliveden.

Applications for tickets for the excursion must be made immediately, as the number of tickets is limited.

The subjects to be discussed are expected to come under the following divisions, namely:—1. Equalisation of the Strength of Official Pharmaceutical Preparations containing Potent Drugs. 2. Pharmaceutical Education. 3. Pharmacopœia Revision.

The Cork Pilocarpin Case.

MR. CRAWFORD, the plaintiff in this well known case, has withdrawn the notice which he had given for a new trial in the action at the current Cork Assizes. The matter is therefore now at an end.

The Metropolitan Hospital Sunday Fund.

THE fund now amounts to over £32,000. With money still coming in, we may be sure that it will be the largest collection yet made, although below what was generally anticipated, it would attain to.

At the Cork Assizes on Wednesday, John Kellegher, a pauper inmate of Cork workhouse, was sentenced to five

years' penal servitude for a murderous assault with a poker on Dr. Wall, the visiting physician.

THE Pharmaceutical Council, having applied to the Royal Commission on the Medical Acts for a hearing, were asked to indicate the purport of the evidence they wished to offer. They have found it impossible to agree on any subjects for submission to the Commission, and have therefore, for the present, withdrawn their application.

THE Bradshaw lecturer this year at the London College of Physicians is Dr. Vivian Poore. The subject chosen is, "Nervous Affections of the Hand," and the date of delivery Thursday, August 15, at 5 p.m.

LAST week Professor Spence was presented with his portrait—the gift of "the members of the medical profession of Great Britain and Ireland and the Colonies." Dr. Haldane, President of the Edinburgh College of Physicians, made the presentation. A replica of the portrait is to be hung in the College of Surgeons of Edinburgh.

THE annual rates of mortality last week in the principal large towns of the United Kingdom were—Bradford 12, Wolverhampton 16, Brighton 16, Edinburgh 17, Salford 17, Bristol 18, Sunderland 18, Norwich 18, Sheffield 18, Glasgow 19, Plymouth 19, Birmingham 20, Nottingham 20, Oldham 20, Portsmouth 21, Hull 21, Dublin 21, Leicester 21, Manchester 22, Newcastle-on-Tyne 22, London 24, Leeds 26, and Liverpool 28 per 1,000 of the population.

MR. W. MACCORMAC has quite recently received from King Ludwig of Bavaria the Knight's Cross of the first class of the highest military order of Bavaria, for eminent services rendered during the war of 1870-71. He has also received a Cross of Commander of the Order of Takovo, for services rendered in Serbia during the Turko-Servian campaign, at the battle of Alexinatz, and in the distribution of the extensive ambulance material and medical aid rendered from English sources during that campaign.

THE Council of the Medical Defence Association having been invited by the Royal Commission to state the views of the Association on the subject of medical reform, has decided to call a representative meeting of the profession to discuss the question and pass resolutions thereon. The meeting will be held at St. James's Hall, on Friday, 29th inst., and the chair will be taken by the President, Dr. B. W. Richardson, F.R.S., at 4 o'clock, p.m. The Council trusts that independent members of the profession will attend in large numbers, as their representations at this critical moment may have the most important influence on future legislation.

FROM diseases of the zymotic class in the large towns last week measles showed the largest proportional fatality in Liverpool and Sheffield; scarlet fever in Hull, Nottingham, Sunderland, and Leicester; and whooping-cough in Leicester, Newcastle-upon-Tyne, and Manchester and Salford. Diphtheria caused 6 more deaths in

Portsmouth; and the highest death-rate from fever occurred in the same town. Small-pox caused 56 more deaths in London and its outer ring of suburban districts, 2 in Liverpool, and one in Brighton. The fatality of diarrhoea showed a further considerable increase, especially in London and Leeds; the annual death-rate from this disease was equal to 4.0 per 1,000 in London, and averaged but 1.7 in the provincial towns.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

GLASGOW UNIVERSITY—PRESENTATION TO DR. JAMES A. ADAMS.—On the 15th inst., being the termination of the summer medical session at the University of Glasgow, Dr. James A. Adams, demonstrator of anatomy, was presented, by Mr. Mavor, medical student, on behalf of his fellow students of the osteology class—about one hundred in number—with a handsomely-mounted and fitted oak secretaire, with a suitable inscription, in token of their warm personal regard, and of their high appreciation of his lectures on osteology. From what we know of Dr. Adams we feel quite persuaded that this gratifying acknowledgment is a well-merited one, and does equal credit to the students, who, as a class, are kind-hearted and generous, and not slow to appreciate merit and gentlemanly courtesy.

EDINBURGH—HEALTH OF THE CITY.—Only 66 deaths (exclusive of 9 country deaths) were reported during the week ending 16th inst., equivalent to an annual mortality of 15 per 1,000. This number is 24 below the weekly average of last year. Of the 66, 10 occurred in the southern suburbs, 33 in the Old Town, and 23 in the New Town. Only 4 deaths were due to zymotic causes.

PEARLES HYDROPATHIC ESTABLISHMENT.—This magnificent institution was formally opened on Friday, the 15th inst. It is situated in a charming country, is a model of perfection in all its arrangements, no less a sum than £80,000 having been expended on the house and grounds, and is under the able medical superintendence of an accomplished medical gentleman, Dr. Donald MacGregor. We feel confident that such attractions as the house and locality present will be duly appreciated by the public.

PRESENTATION TO PROFESSOR SPENCE.—On the 18th inst., Professor Spence was presented with his portrait in the Hall of the Royal College of Surgeons of Edinburgh. Mr. Imlach, President of the College, in the chair. The portrait is the gift of "the members of the profession of Great Britain and Ireland, and the Colonies." Dr. Haldane, President of the Royal College of Physicians made the presentation. He said that it had been resolved that the most appropriate form their movement could take would be that of presenting Professor Spence with his portrait, and without the least effort, and by appealing only to the members of his profession, a sufficient sum was raised to fulfil all they desired, and now they had the portrait before them by one of the leading artists. It was no ordinary honour now conferred on Mr. Spence, for to be held in such esteem by such a circle of friends showed that the man must be in the highest degree worthy of such an honour. After referring to Professor Spence's distinguished career as a surgeon, Dr. Haldane, in the name of the subscribers presented the portrait. Professor Spence suitably acknowledged the gift. A vote of thanks having been given to Mr. James Irvine, the artist, and to Mr. Imlach, and the

committee, the proceedings terminated. A replica of the portrait is to be hung in the Royal College of Surgeons, and each subscriber is to receive an etching of the work by Durand of Paris. We beg to congratulate Professor Spence. His reputation and the esteem in which he is held, are "based on none of the ephemeral visions of modern surgery," but on long and honorable faithfulness to duty, and a genuine loyalty of science properly so-called.

EDINBURGH UNIVERSITY COURT.—At a meeting of this court, held on the 18th inst., Dr. Sampson Gamble was recognised as a teacher of medicine in Glasgow, whose course of lectures on practice of medicine should qualify for graduation in medicine in the University under ordinance No. 8, section 6. Arrangements under which Dr. Blair Cunningham had been appointed to act as examiner in pathology at the July examination were approved. Likewise, arrangements under which Dr. H. Alleyne Nicholson had been appointed to conduct the class of natural history for Professor Wyville Thomson during the current session were approved.

THE ABERDEEN MILK EPIDEMIC.—Readers will probably remember that in the beginning of April last an epidemic of a peculiar nature broke out in Aberdeen among a large number of families who were supplied with milk from a certain dairy. The attacks were sudden and severe, among the symptoms of the disease being a shivering followed by violent fear, a swelling and pain of the glands and muscles of the neck. It was also attended with biliousness, sickness, often with vomiting, and a great degree of febrile excitement. The disease, which was new to the faculty in Aberdeen was regarded by them as being dependent on organic poison in the milk. The Board of Supervision sent down two commissioners to inquire into the outbreak, previous to which important microscopic observations had been made as to the nature of the organic poison by Professor Cossar-Ewart, and Dr. Walker, of Aberdeen, specimens of the milk secured at the time of the outbreak and the fluids, &c., obtained at the *post mortem* examination of one of the fatal cases being thus examined. It was subsequently considered necessary for the due prosecution of these observations that experiments on some of the lower animals should be instituted, and for this purpose licences were obtained for both observers. These experiments were of a delicate nature, requiring time for their adequate investigation, and it was the delay thus occasioned which has prevented the commissioners from making their report earlier. A record of Professor Ewart's observations was received by the commissioners a few days since, and when Dr. Walker's completed analysis reaches them a joint report will be issued.

Literary Notes and Gossip.

VISITORS to the International Medical Exhibition at South Kensington will find medical literature fairly represented. The three principal medical publishers, Messrs. J. and A. Churchill, Messrs. Baillière, Tindall, and Cox, and Messrs. Smith and Elder, have stands at the end of the Western Quadrant—a novelty in exhibitions which we never remember to have previously seen. At these stands bibliophiles may examine books without any interruption or attempt at sale. Other classes of literature are scarcely represented at all. Messrs. Trübner and Mr. Bogue have small stands, but the great scholastic houses—Longmans, Macmillans, &c.—are conspicuous by their absence.

SPEAKING to an American surgeon, who is over here for the International Medical Congress, on the subject of literary plagiarism, he remarked, "Few of us pretend to write anything original; we either haven't the time or we

haven't the mind. You Europeans leave us nothing to do, and so instead of pretending to take you down a stripe we take a book that we guess will suit our purpose, make a few foot-notes, and stick another name on the title-page. The book is none the worse for it, and its new author is helped like a lame dog over a tall stile."

THIS admission has certainly the merit of frankness, and although we took it as it was probably meant, truth, nevertheless, underlies many a joke. A stronger illustration of this cannot be found than by referring to the last number of the *American Journal of the Medical Sciences*, page 233, for July. The reader will here find a criticism of an "Illustrated Descriptive Anatomy," a book brought out as original in 1881 by Dr. Ranney, adjunct professor of anatomy in the University of New York, whereas the same book, almost *verbatim, et literatim, et punctuatim*, was published in 1845, as a translation by Dr. Pattison of Professor Masse's celebrated "Anatomical Plates."

THE writer of the said criticism winds up his most crushing review by saying that he had just received a circular from the publishers to the effect that the omission of the late author's name was omitted "through a clerical error." A remarkable clerical error certainly to have escaped the notice of the type-setter, proof-reader, Dr. Ranney himself, and the publisher; a remarkable clerical error, too, which substituted the *soi-disant* author's address at the foot of the preface for that of the deceased writer. We are glad Dr. Ramsey is not to deliver the address on "Our Literature" at the coming Congress!

A RIVALRY of some importance to the surgical world and to students between the two principal medical publishers in the United States is about to result in the publication of two encyclopedias of surgery. Messrs. Lea and Co. are, with the assistance of about thirty surgeons, editing the last edition (1872) of "Holmes's System of Surgery," whilst Messrs. Wood and Co. announce an "International Surgery," by various authors. The former will be ready in the autumn, complete in three volumes; the latter will be published quarterly, after the manner of Zeimssen, and will be complete in six volumes.

A YEAR or so ago Messrs. Wood and Co., of New York, announced the publication of "A Library of Standard Medical Authors." The idea was to issue a series of volumes monthly by various authors and on various subjects for a subscription price of so much for the whole year. In the first series published, many of the works were by English authors and had already appeared in this country, but success attended the enterprise in the States, and a second series has been started, this time in the United Kingdom and America simultaneously, Messrs. Wood and Co., being the publishers in New York and Messrs. Sampson Low and Co. the agents for this country. The first eleven volumes are now ready for delivery, and the price of the twelve complete is four guineas.

NONE of the present issue are works of English authors, which is an advantage to intending subscribers, many of whom would probably already possess them. Of the eleven volumes ready for delivery (together or monthly, at the option of the subscriber) five are translations from the French, two from the German, and four are American. Of course, much may be said both for and against the issue of a series of miscellaneous works unpurchasable separately. On payment of his subscription of £4 4s. in advance the subscriber gets each volume for seven shillings, which for several of them is decidedly cheap. On the other hand, there may be but one of the whole which interests him, and to get this he must subscribe for the dozen. Publishers can hardly expect that an oculist will have a gynaecological work forced on him, or a pure physician one on operative surgery, for which reason we consider the system objectionable.

WE presume it is too late now to counsel the publishers to issue each volume on its own merits. Why should the

production of some unknown aspirant to fame be dragged in on the coat-tails of Trousseau? Doubtless, the method will attain notoriety for some whose books might be lost in oblivion, but it is somewhat hard on Trousseau. We doubt the wisdom of issuing this "Library of Standard Medical Authors" unless readers are allowed to choose and to pay for what they require; to attempt to compel them to subscribe for others than those they need will, we feel sure, result in failure; and the better books of the series will as a consequence remain unread. For the information of those interested we annex a list of eleven out of the twelve volumes to hand for 1881-82: "A Treatise on Therapeutics," by Drs. Trousseau and Pidoux, vols. I., II., III.; translated by D. F. Lincoln, M.D. "A Treatise on Foreign Bodies in Surgical Practice," by Alfred Poulet, M.D., vols. I., II. "A Treatise on Diseases of the Nervous System," by M. Rosenthal; translated by M. Putzel, M.D. "Diagnosis and Treatment of Ear Diseases," by A. H. Buck, M.D. "Minor Surgical Gynaecology," by Paul F. Mundé, M.D. "The Materia Medica and Therapeutics of the Skin," by Henry G. Piffard, M.D. "The Venereal Diseases," by E. L. Keyes, M.D.

MRS. ERNEST HART contributes to the *Quarterly Journal of Microscopical Science* an interesting paper on the enumeration of the blood corpuscles under the microscope. The practical value of an exact enumeration of these corpuscles in the diagnosis and prognosis of anæmia is of considerable importance in medical practice. What was wanted was a reliable method of counting these minute and variable bodies, and this difficulty has at length been overcome. Mrs. Hart explains the several methods proposed by Melasser, Hayem, and Gowers, and in what particulars these fail to ensure accuracy. The first-named, the best of the three, she has improved upon, and will doubtless come into general use, from the fact that it can be depended upon when used with any microscope and without specially arranged apparatus.

UNDER the editorship of Dr. Frank Crisp, the *Journal of the Royal Microscopical Society of London* maintains its high position, as an able exponent of the science. The current number, equal in bulk to most ordinary sized octavo volumes, furnishes the microscopist with a complete *résumé* of all that pertains to his favourite study, as well as to the various allied departments of natural history, as zoology, botany, &c., which, from being widely scattered throughout serials, would otherwise remain almost inaccessible to the student and general reader. Besides this we find, *in extenso*, numerous valuable papers: one "On the Estimation of Aperture in the Microscope," by Professor Abbe, who has treated the subject in so exhaustive a manner as to leave no longer room for doubt on the increased value of aperture obtained by the immersion system. There are other articles of interest, "On a New Rhizopoda Dialines discovered in the London Clay," &c.; and what is of some interest to the profession, the experiments of Dr. Thin, to develop the spores of *Trichophyton tonsurans*, the ringworm fungus, and the method of distinguishing between a growth of adventitious fungus, and that of *Trichophyton*. The fact is an important one, that "the spores of the latter will not grow when immersed in vitreous humour, or other fluid of like density, whilst they do grow when only moistened by it," explains why inflammatory exudation from the blood-vessels cures ringworm of the scalp.

A LOVING hand has here reproduced (Lectures, by Professor Cryan, F.K.Q.C.P.I., M.R.I.A., edited with a memoir, &c., by Robert Reilly. Dublin: M. H. Gill and Son, medium 8vo, pp. 81) two Public Addresses, delivered by the late lamented Professor Robert Cryan, and which, at the time, attracted marked attention and favourable comment. The little volume begins with an interesting biographical sketch of their author, in which the career of one who rose to public esteem and professional eminence by honest hard work, is described in terms of simple truthfulness. Throughout a long progress, Robert Cryan made hosts of attached friends, and not a single enemy; and, if his retiring and unassuming merits were principally recognised by his own profession, that circumstance will not strike a less responsive chord in the hearts of his old colleagues and pupils, when they read Mr.

Reilly's touching "In Memoriam" Ode. One of these addresses was delivered to the medical staff and students of St. Vincent's Hospital on the opening of the Session 1871-2, in the presence of a large number of the lay friends of the Institution, Lord O'Hagan, Lord Chancellor of Ireland, in the Chair, and deals with the (at that time) recent advances in clinical medicine. The other was addressed to the Faculty of Medicine, and the medical students of the Catholic University, on the inauguration of their Seventeenth Session, and treats of the general humanitarian aspects of the medical profession. At the time we listened with gratification to both these addresses, and, it is now with pleasure, mingled with deep regret, that we once more go over the words of "a voice that is still." The lectures are illustrated with suitable and interesting foot notes by the editor, who has brought to his task an amount of feeling and judgment, of which Dr. Cryan's friends will all approve.

NEW BOOKS AND NEW EDITIONS.—The following have been received for review since the publication of our last list, June 22nd:—"Rheumatism: its Nature, Pathology, and Treatment." By T. J. MacLagan, M.D. "On Cancer: its Allies and other Tumours." By F. A. Parcell, M.D. "The Use of the Laryngoscope." By Gordon Holmes, L.R.C.P. Ed. "How to make the Best of Life." By J. Mortimer Granville, M.D. "Therapeutic and Operative Measures for Chronic Catarrhal Inflammation." By T. F. Rumbald, M.D. "Retrospect of Medicine," vol. lxxxiii. Edited by Drs. W. and J. Braithwaite. "The Harrogate Waters." By G. Oliver, M.D. "Venereal Diseases." By E. L. Keyes, M.D. "Minor Surgical Gynaecology." By Paul F. Mundé, M.D. "The Diseases of the Nervous System." By M. Rosenthal. Translated by L. Putzel, M.D., 2 vols. "Materia Medica and Therapeutics of the Skin." By H. J. Piffard, M.D. "Diagnosis and Treatment of Diseases of the Ear." By A. H. Buck, M.D. "Trousseau's Therapeutics." Translated by D. F. Lincoln, M.D., 3 vols. "Treatise on Foreign Bodies in Surgical Practice." By Alfred Poulet, M.D.

Correspondence.

CALF LYMPH.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The interesting correspondence which my letter has evoked, and your extremely able leader on this subject, show that the questions I ventured to raise were not altogether inopportune; for while on the one hand Dr. Warlomont, Dr. Wyld and Mr. Fleming agree in condemning Mr. Ceely's "small-pox lymph," Dr. Drysdale on the other hand, with "nearly all, if not all, the medical authorities" in this country at his back, affirms his belief in the essential identity of small-pox and cow-pox, and declares Mr. Ceely to be right and the Lyons Commission to be wrong.

The careful perusal of Mr. Fleming's recent work, and the recent report of the Lyons Commissioners, can, I think, leave no reasonable doubt in an unbiassed mind, that a great blunder has been committed, that a vast amount of this "small-pox lymph" has been disseminated under the name of vaccination, and the law for enforcing vaccination made the means of breaking the law forbidding inoculation; a procedure which cannot fail to strengthen the hands and augment the agitation of the anti-vaccination party.

With regard to retro-vaccination, your correspondents are unanimous in their disparagement of it, Dr. Wyld believes it to be impossible, Dr. Drysdale says it is non-protective, while Dr. Warlomont "damns it with faint praise."

The only points which are not so clear to me as they seem to your correspondents, are those of the safety and efficacy of the "spontaneous cow-pox," for let it be remembered, Jenner's opinions, though by no means infallible, were nevertheless arrived at by inoculating with small-pox those who had been previously vaccinated; have Dr. Warlomont and Wyld submitted their prophylactic to this very critical test? Negative evidence however extensive, cannot be placed on an equality with positive experiment, and I may add, that I for one, am aware of at least two cases in which fatal small-pox followed vaccination with calf lymph.

That the lymph of spontaneous cow-pox is innocent of syphil.

its contamination is a great and indisputable advantage. The other dangers with which it has been charged are Mr. Fleming considers "unworthy of consideration," with the possible exception of one—viz., tuberculosis. That bovine tuberculosis may be communicated to man through the milk, has been pointed out by Dr. Creighton in his admirable monograph; that it cannot be communicated by the inflammatory lymph of a vaccine vesicle remains to be proved.

In conclusion, I would remark that, considering the rigour with which the Vaccination Acts are enforced, it is at least reasonable to demand that the vaccination provided, should be at once genuine in its source, harmless in its action, and thoroughly protective against small-pox.

I am, Sir,

Yours obediently,

W. J. COLLINS, B.Sc. M.R.C.S.

St. Bartholomew's Hospital, E.C.

July 14th, 1881.

CALF VACCINE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—With regard to Dr. Drysdale's remarks that the best authorities are now agreed that vaccine is only a modified form of human variola, I would beg to say:—

1. The analysis of this question is very difficult.
2. The continental interpretation is, that the two viruses are distinct.
3. It is difficult to inoculate a heifer with human small-pox; that only one attempt in ten succeeds.
4. The result is the production of modified variola, not vaccinia.
5. This seems to be proved, by the fact that, although you can easily inoculate a second heifer from the first, you have very great difficulty in inoculating a third from the second, and you cannot succeed in inoculating a fourth heifer from the third heifer.
6. It is quite the reverse with spontaneous vaccinia, for from this source, you can vaccinate an endless succession of calves or heifers without any difficulty.

I am, Sir,

Yours obediently,

GEORGE WYLD, M.D.

12 Great Cumberland Place,
Hyde Park.

THE ORIGIN OF VACCINIA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Mr. Warlomont's letter has interested me most extremely, and the more so, because when I last had the honour of conversing with that illustrious authority on animal vaccination at Cambridge, last autumn, he had not made up his mind as to the origin of vaccination. Neither had I at that date, as I knew what had been written by the Lyon's physicians. However, it happened that I had a very long conversation with the late Mr. Ceely, of Aylesbury, at Cambridge, and he most kindly went into the subject of the production by himself of true vaccine vesicles on the cow by the inoculation of the matter of small-pox on the udders. Again and again did he assure me that he had on several occasions succeeded in this experiment, and that he had afterwards vaccinated many children with the lymph from these vesicles. A sceptic before, I remained convinced; and, therefore, unless Mr. Warlomont has something more to tell us than we have heard from MM. Chauveau, Viennois, and Meynet, I can only say that the positive experiments of Ceely must be taken to have proved the point that vaccinia is merely human small-pox modified in some way by transmission through the cow.

Mr. Badcock, of Brighton, is the only other living witness to this truth with the exception, I think, of Dr. Greene, of Birmingham. Both of these gentlemen, I would suggest, should be asked to take part in your debate.

Some two years ago I was so full of enthusiasm about this interesting question as to propose to the Council of the Medical Society of London that it should appoint a committee to carry out further experiments to settle the question; but the members of the Council were not equally interested

and would not take it up. And yet, in the country of Edward Jenner, it is strange that the matter remains undecided.

Your obedient servant,

CHARLES R. DRYSDALE, M.D.

17 Woburn Place, London, W.C.

July 22, 1881.

CALF-LYMPH.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The more the relation between vaccinia and small-pox is discussed, the more it is to be expected will the belief in their identity be exposed as erroneous. The practical difficulty of inoculating cows with variola matter, and the vast difference of the products of cow-pox, the speedy deterioration and death in subsequent generations of the product, if any, in the case of variolation, as well as the occasional coincidence of quite regular small-pox and vaccinia in the same individual are certainly highly important differential features. But the proof becomes conclusive by the fact that when human beings inoculated with the products of variolation of heifers, not vaccinia but small-pox was the result in the first and following removes. The expected transformation of the small-pox virus into vaccine virus had not taken place, and could not take place because it is not possible to transform one specific virus into another virus of different character.

Propagating vaccinia is therefore widely different from practising inoculation. The value of vaccination is based upon the remarkable and indisputable fact of their antagonism by which an attack of the one protects against the other, and although vaccinated persons are no more submitted to the test of inoculation, they have stood the test of their immunity by exposing themselves in the natural way to the infection with small-pox during epidemics. This test is perhaps more conclusive than the experiment which requires a certain skill and carefulness in the operator, and not unfrequently fails. The protection afforded by true animal vaccination is evident from the vast experience of Drs. Warlomont and Martin, which extends over many years and many thousands of cases. I have personally heard from Dr. Martin that he took great pains to find out whether small-pox had ever followed vaccination performed by himself, and that he did not find one case. This can certainly not be called a negative evidence, but is at least equal to positive experiment. Your correspondent, Mr. Collins, states that he knows of two cases in which fatal small-pox followed vaccination with calf-lymph. As he evidently takes great care in studying the question, he certainly knows that his statement without particulars cannot claim any value. If, for instance, the small-pox in his case broke out before the protection of vaccination was established, or if the operation had been unsuccessful for some reason or other, there is nothing unusual in his assertion, which as it stands is very apt to mislead and produce misapprehension as to the alleged dangers of cow-pox lymph. Professor Fleming does not under-estimate them when he considers that supposed to arise from entozootic asthma "to be unworthy of consideration," for the simple reason that such a disease does not exist.

There are certainly transferable diseases in the bovine species, which might give rise to dangers; but these are so easily recognised, that they are practically nil, if only ordinary care is employed in the selection of the animals. Besides, it is a general experience that whenever the vaccinated animals get out of health, no vesicles result, and sometimes even the animal remains susceptible, and can be successfully vaccinated after recovery. A simple diarrhoea is often sufficient to stop the development of vesicles.

The only possible exception is tuberculosis, which however, differs from the corresponding disease in man, inasmuch as it is extremely rare in the young, and this is the reason why I select young calves for vaccination in my establishment.

Finally, I heartily agree with your correspondent's conclusion, namely, that the vaccination should be at once genuine in its source, harmless in its action, and thoroughly protective against small-pox. And for this reason "animal vaccination" should be adopted by the profession and the Government!

Yours, &c.,

CHARLES RENNER, M.D.

228 Marylebone Road, London W.

NOTICES TO CORRESPONDENTS.

CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

DR. C.—We do not approve of such schemes, and do not care to lend countenance thereto by our presence.

MR. BARCLAY.—About sixty passed in the Honours division last month at the University of London, about 800 in the first division, and about ninety in the second division Matriculation Examination. We have not space for any lists but medical in our columns.

A DISGUSTED POOR-LAW OFFICER.—Your case reminds one of the story told of the late Frank Buckland, who, when endeavouring to carry a turtle by railway, and about to put it under the seat, was met by the guard's official ruling, "dogs is dogs, cats is cats, but turtles is insects." We fear that a change of guardians, with the possibility of a gentleman being amongst them, is your only hope.

MR. F. PERCIVAL.—It would be a tedious and withal an expensive process to submit every preparation to analysis. We are unaware of the composition of "Myocum" advertised in our columns, but we have applied to it a very practical test, and find it perfectly answers the purpose for which it is sold—viz., an effective fly-catcher. We believe there is nothing Japanese about it except in name; it has the appearance of liquid caoutchouc, appears to have an attractive aroma for flies and insects of all kinds, and sticks them most firmly the moment of contact.

MR. S. GIBSON.—The discussion was approvingly referred to in our issue for July 13.

"CORONER'S INQUESTS."

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Might I trouble you to answer the following queries in your issue for next week.

1. Is it legal for a coroner or a crown sergeant of the police to remove the body of a person accidentally killed, a distance of about three miles from the place where the accident occurred to a livery stable, instead of the nearest house licensed for the sale of spirits (as stated in the Coroner's Ireland Bill) and which would be a distance of about half a mile from where the body was found?

2. Having done so, to summon the medical dispensary officer of the adjoining district to give evidence at the inquest instead of the medical officers of the district, in actual practice at, or near, the place where the death had occurred, and who had first examined the body.

3. If this practice is illegal what steps should be taken to prevent its recurrence?

I remain, Sir, yours faithfully,
H. D.

[1. Under the Coroner's (Ireland) Act, sec. 86, "it shall, and may be lawful for the coroner to direct that the dead body shall be brought to the nearest convenient public house," and to fine the owner if he refuses to allow it to remain there. We believe this section binds the coroner, and that removal of the body elsewhere is illegal. 2. The medical officer of an adjoining district, unless he be the nearest to the place of inquest, is not, in our opinion, the person whom the Act orders to be summoned. 3. Have the coroner's-mileage fees and the fees of the medical witness challenged before the Grand Jury and the Judge when they come up for *stat*. The principle involved is important, and the breach of the law by coroners is very common, so that the matter ought to be contested for the sake of the profession.—ED.]

MR. WM. YOUNG.—Your statistics on vaccination are both illogical and fallacious. Old reports which have been many times previously disproved are brought in as new facts; and inasmuch as men do not care to be continually taking the trouble of exposing the same, you pretend to assume that your *preaching* is gospel, and the *stence* of more sensible people acquiescence.

DR. HARRIS.—To hand at the moment of going to press; will refer to the subject in our next.

THE MEDICAL ACTS' COMMISSION.—At the meetings of the Commission, held July 22nd, 23rd, and 25th, the evidence of Prof. Spence, Prof. Gamgee, Dr. B. Hunter Semple, Dr. Pittman, and Mr. Christopher Heath was taken.

AWKWARD FOR ANTI-VACCINATORS.—At the meeting of the Bristol Sanitary Authority on Friday last the medical officer reported an outbreak of small-pox in Clifton College. A pupil belonging to a family which the medical officer says is "afflicted with a superstitious belief in the imaginary evil effects of vaccination," was allowed to visit his home in a neighbouring town. On his return to the College he became ill with small-pox, and was isolated.

MR. HAYES would do well to make an inspection of the exhibits in the sanitary section of the International Medical and Sanitary Exhibition, South Kensington, when he will see that his invention has been anticipated by at least two others.

A READER.—1. Messrs. Macmillan are the publishers. 2. We have not yet seen the book, but believe it was published by Messrs. Lea and Co., Philadelphia, last month. You will probably be able to get a copy at Baillière's or Trübner's.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Please inform in your next issue of the *Medical Press and Circular* whether one who had obtained, before the passing of the Pharmacy (Ireland) Act of 1875, the Degree of Licentiate of the College of Physicians and Surgeons, Edinburgh, can, according to that Act, keep a shop for the sale of medicine, and, if so, whether he can dispense or compound any other prescriptions except his own.

Yours truly,
QUARRERUS.

July 28, 1891.

[By sec. 30 of the Act, "Any person registered as a legally qualified medical practitioner who, in order to obtain his diploma, shall have passed an examination in pharmacy, is exempted from the prohibition against keeping open shop for retailing, dispensing, or compounding poisons" in Ireland. We presume the examinations of the Edinburgh Colleges include this subject. If so, the holder of their diploma may keep open shop and dispense prescriptions for all comers.—ED.]

ASSISTANT SURGEON.—Yes, the operation did take place and was successful; we are promised a detailed report.

DR. HENRY DRUMMOND (of Springsure, Australia) now in this country, will oblige by communicating his address to the London Editor of the *Medical Press*. An important letter is awaiting him.

A VISITOR.—Dr. Paul Mundé is, we believe, at present in Germany, we saw him a week since, he expects to be in London again at the Congress; a letter addressed to the American Exchange will find him.

MR. W. B. (Leeds) will receive a private note.

THE PRACTICAL TREATMENT OF DIPSO MANIA.—In Dr. Richardson's speech on the "Treatment of Dipsomania," reported in our last issue, an error occurs which requires correction. In the passage on the influence of religion on the dipsomaniac class, the reading given in our last should be corrected as follows: "He (Dr. Richardson) wished from his heart he could agree with those speakers who thought they found a panacea for drunkenness in religious influence. There was no doubt religion was most beneficial in some cases, but much depended on the kind of religion that was taught. If that were gloomy and threatening, and hopeless, it sometimes led back to the use of stimulants. He had noticed, notably, as a psychological fact, that the Catholic religion, which was most imperative of all in its teachings, and the ministers of which spoke with great decision, excited effect which was often a very determinate aid to reform. But the effects of religious brooding over doubtful points in theology were most injurious."

Vacancies.

Birmingham Queen's Hospital.—Resident Surgeon. Salary, £50, with board. Applications under cover to the Secretary by August 2.
Carnarvon Infirmary, Bangor.—House Surgeon. Salary, £100, with board. Applications to the Secretary before August 11.
Lambeth.—Medical Officer of Health for the Parish. Salary, £300. Full particulars of the duties on application to the Vestry Clerk.
North Stafford Infirmary, Stoke-on-Trent.—House Surgeon. Salary, £120. House Physician. Salary, £100. Each with board. Applications to the Secretary before August 17.
Ripon Dispensary.—Resident House Surgeon. Salary, £60, no board. Applications to the Hon. Sec.
Stockton-upon-Tees Hospital.—House Surgeon (non-resident, doubly qualified. Salary, £200 per annum. Applications to the Secretary by August 9.

Appointments.

MASSEY, W., L.R.C.P.Ed., M.R.C.S.E., Medical Officer for the Castle Donington District of the Shardlow Union.
MULLER, J. W., L.K.Q.C.P.I., Resident Medical Officer to the Wilton Fever Hospital, Salford.
NELL, E. F., M.R.C.S.E., Medical Officer for the Penarth District of the Cardiff Union.
NEWMAN, A. C., M.R.C.S.E., Medical Officer for the Harwell District of the Wantage Union.
PAUL, F. T., F.R.C.S.E., L.R.C.P.L., Honorary Surgeon to the Royal Southern Hospital, Liverpool.
PATNE, H., M.R.C.S.E., L.R.C.P.Ed., House Surgeon to the Ashdon-under-Lyne Infirmary.
ROSS, D., M.D., L.R.C.S.Ed., Medical Officer to the Parish of Fortree, Isle of Skye.
SHAPLEY, H. T., M.B., C.M., L.R.C.P.Ed., M.R.C.S.E., Surgeon to the Police of the Borough of Leamington.
SPREAFIELD, J. F., F.R.C.S.E., Professor of Clinical Ophthalmic Surgery at University College.
SYMES, J., L.R.C.P.Ed., L.R.C.S.I., Medical Officer of Health for the Briton Ferry Urban Sanitary District.
TREHARNE, J. L., M.R.C.S.E., Medical officer for the Spottlands District of the Cardiff Union.

Births.

DAVIS.—July 8, at Clare View, Newport, co. Mayo, the wife of Hugh A. Davis, M.D. of a son.
HOLDER.—July 19, at Sudbury, Suffolk, the wife of J. Sinclair Holder, M.D. of a son.
SANDERS.—July 18, at Sharow, near Ripon, the wife of Surgeon-Major E. C. Sanders, Indian Medical Department, of a daughter.
SAUNDERS.—July 15, at Pietermaritzburg, Natal, the wife of Surgeon W. E. Saunders, A.M.D., of a son.
SMITH.—July 21, at 15 Imperial Square, Cheltenham, the wife of W. Robert Smith, M.D., F.R.S. Edin., of a daughter.

Marriages.

WOOD—HOLBERTON.—July 20, at the Church of St. Peter and St. Paul, Teddington, Edward J. Wood, M.B. Cam., of Yalding, Kent, to Ethel Vaughan, eldest daughter of Vaughan Holberton, Esq., of Hampton, Middlesex.

Deaths.

WALSH.—July 9, at Brewod, Stafford, Samuel Walsh, B.A. (T.C.D.), M.B., L.R.C.S.I.

WITH MEDICO-SANITARY SUPPLEMENT.

INTERNATIONAL MEDICAL CONGRESS.

INAUGURAL ADDRESS,

Delivered in St. James's Hall, Wednesday, August 3rd, by the President,

Sir JAMES PAGET, Bart., F.R.S.;

Serjeant-Surgeon to Her Majesty the Queen; Surgeon to His Royal Highness the Prince of Wales; Consulting Surgeon to St. Bartholomew's Hospital.

It is not necessary to defend the meeting of an International Congress. Such meetings have become one of the general customs of our time, and have thus given evidence that they are generally approved. Let me rather suggest to you some thoughts as to the work which, being in Congress, we have to do, and the spirit in which it may best be done, so that the good effects of our meeting may last long after our parting.

In the largest view of our design it may seem to be that of bringing together a multitude of various minds for the promotion and diffusion of knowledge in the whole science and art of medicine, in their widest range, in all their narrowest divisions, in all their manifold utilities. And this design, I cannot doubt, will be fulfilled; for, although the programme tells of selected subjects for discussion, and defines the order of our work, yet knowledge will be promoted in a much wider range in the meetings without order, which will be held every day and everywhere—meetings of men with all kinds of mental powers and all forms of knowledge and skill; everyone ready, alike to impart and to acquire knowledge.

It is safe to say that in the casual conversations of this coming week there will be a larger interchange and diffusion of information than in any equal time and space in the whole past history of medicine. And with this interchange will be a larger increase, for in the mart of knowledge he that receives gains, and he that gives retains, and none suffer loss.

The increase will be the greater because of the great variety of minds which will meet. As I look round this hall, my admiration is moved not only by the number and total power of the minds which are here, but by their diversity—a diversity in which I believe they fairly represent the whole of those who are engaged in the cultivation of our science. For here are minds representing the distinctive characters of all the most

gifted and most educated nations; characters still distinctly national, in spite of the constantly-increasing intercourse of the nations. And from many of these nations we have both elder and younger men; thoughtful men and practical men; men of fact and men of imagination; some confident, some sceptic; various, also, in education, in purpose and mode of study, in disposition and in power. And scarcely less various are the places and all the circumstances in which those who are here have collected and have been using their knowledge. For I think that our calling is pre-eminent in its range of opportunities for scientific study. It is not only that the pure science of human life may match with the largest of the natural sciences in the complexity of its subject matter; not only that the living human body is, in both its material and its indwelling forces, the most complex thing yet known; but that in our practical duties this most complex thing is presented to us in an almost infinite multiformity. For in practice we are occupied, not with a type and pattern of the human nature, but with all its varieties in all classes of men, of every age and every occupation, in all climates and all social states; we have to study men singly and in multitudes, in poverty and in wealth, in wise and unwise living, in health and all the varieties of disease; and we have to learn, or at least to try to learn, the results of all these conditions of life while, in successive generations and in the mingling of families, they are heaped together, confused and always changing. In every one of all these conditions man, in mind and body, must be studied by us; and every one of them offers some different problem for inquiry and solution. Wherever our duty or our scientific curiosity, or, in happy combination, both, may lead us, there are the materials and there the opportunities for separate original research.

Now, from these various opportunities of study, men are here in Congress. Surely, whatever a multitude and diversity of minds can, in a few days, do for the promotion of knowledge, may be done here. Everyone has something he may teach, much more that he may learn; and, in the midst of an apparent utter confusion, knowledge will increase and multiply. It has been said, indeed, that truth is more likely to emerge from error than from confusion, and, in some instances, this is true; but much of what we call confusion is only the order of nature not yet discerned, and so it may be here. Certainly it is from what seems like the confusion of successive meetings such as this that that kind of truth emerges which is among the best moving and directing forces in the scientific as well as in

the social life—the truth which is told in the steady growth of general opinion.

But it is not proposed to leave the work of the Congress to what would seem like chances and disorder, good as the result might be; nor yet to the personal influences by which we may all be made fitter for the work, though these may be very potent. In the stir and controversy of meetings such as we shall have there cannot fail to be useful emulation; by the examples that will appear of success in research, many will be moved to more enthusiasm, many to more keen study of the truth; our range of work will be made wider, and we shall gain that greater interest in each other's views, and that clearer apprehension of them, which are always attained by personal acquaintance and by memories of association in pleasure as well as in work. But as it will not be left to chance, so neither will sentiment have to fulfil the chief duties of the Congress.

Following the good example of our predecessors, certain subjects have been selected, which will be chiefly, though not exclusively discussed, and the discussions are to be in the sections into which we shall soon divide.

Of these subjects it would not be for me to speak, even if I were competent to do so; unless I may say that they are so numerous and complete that—together with the opening addresses of the Presidents of Sections—they leave me nothing but such generalities as may seem commonplace. They have been selected, after the custom of former meetings, from the most stirring and practical questions of the day; they are those which must occupy men's minds, and on which there is, at this time, most reason to expect progress, or even a just decision, from very wide discussion. They will be discussed by those most learned in them, and in many instances by those who have spent months or years in studying them, and who now offer their work for criticism and judgment.

I will only observe that the subjects selected in every section involve questions in the solution of which all the varieties of mind and knowledge of which I have spoken may find their use. For there are questions, not only on many subjects, but in all stages of progress towards settlement. In some the chief need seems to be the collection of facts well observed by many persons. I say by many, not only because many facts are wanted, but because in all difficult research it is well that each apparent fact should be observed by many; for things are not what they appear to each one mind. In that which each man believes that he observes there is something of himself; and for certainty, even on matters of fact, we often need the agreement of many minds, that the personal element of each may be counteracted. And much more is this necessary in the consideration of the many questions which are to be decided by discussing the several values of admitted facts and of probabilities, and of the conclusions drawn from them. For, on questions such as these, minds of all kinds may be well employed. Here there will be occasion even for those which are not unconditionally praiseworthy, such as those that habitually doubt, and those to whom the invention of arguments is more pleasing than the mere search for truth. Nay, we may be able to observe the utility even of error. We may not, indeed, wish for a prevalence of errors; they are not more desirable than are the crime and misery which evoke charity. And yet in a Congress we may palliate them, for we may see how, as we may often read in history, errors, like doubts and contrary pleadings, serve to bring out the truth, to make it express itself in clearest terms, and show its whole strength and value. Adversity is an excellent school for truth as well as for virtue.

But that which I would chiefly note, in relation to the great variety of minds which are here, is that it is characteristic of that mental pliancy and readiness for variation which is essential to all scientific progress, and which a great international Congress may illustrate and promote. In all the subjects for discussion we look for the attainment of some novelty and change in knowledge or belief; and after every such change there must ensue a change in some of the conditions of thinking and of working. Now for all these changes, minds need to be pliant and quick to adjust themselves. For all progressive science there must be minds that are young, whatever may be their age.

Just as the discovery of auscultation brought to us the necessity for a refined cultivation of the sense of hearing, which was before of only the same use in medicine as in the common business of life; or, as the employment of the numerical method in estimating the value of facts required that minds should be able to record and think in ways previously unused; or, as the acceptance of the doctrine of

evolution has changed the course of thinking in whole departments of science; so is it, in less measure, in every less advance of knowledge. All such advances change the circumstances of the mental life, and minds that cannot or will not adjust themselves become less useful, must, at least, modify their manner of utility. They may continue to be the best defenders of what is true; they may strengthen and expand the truth, and may apply it in practice with all the advantages of experience; they may thus secure the possessions of science and use them well; but they will not increase them.

It is with minds as with living bodies. One of their chief powers is in their self-adjustment to the varying conditions in which they have to live. Generally, those species are the strongest and most abiding that can thrive in the widest range of climate and of food. And, of all the races of men, they are the mightiest and most noble who are, or by self-adjustment can become, most fit for all the new conditions of existence in which by various changes they may be placed. These are they who prosper in great changes of their social state; who, in successive generations, grow stronger by the production of a population so various that some are fitted to each of all the conditions of material and mode of life which they can discover or invent. These are most prosperous in the highest civilisation; these whom Nature adapts to the products of their own arts.

Or, among other groups, the mightiest are those who are strong alike on land and sea; who can explore and colonise, and in every climate can replenish the earth and subdue it; and this not by tenacity or mere robustness, but rather by pliancy and the production of varieties fit to abide and increase in all the various conditions of the world around.

Now, it is by no distant analogy that we trace the likeness between these in their successful contests with the material conditions of life and those who are to succeed in the intellectual strife with the difficulties of science and art. There must be minds which in variety may match with all the varieties of the subject-matters and minds which, at once or in swift succession, can be adjusted to all the increasing and changing modes of thought and work.

Such are the minds we need; or, rather, such are the minds we have; and these in great meetings prove and augment their worth. Happily, the natural increase in the variety of minds in all cultivated races is—whether as cause or as consequence—nearly proportionate to the increasing variety of knowledge. And it has become proverbial, and is nearly true in science and art, as it is in commerce and in national life, that, whatever work is to be done, men are found or soon produced who are exactly fit to do it.

But it need not be denied that, in the possession of this first and chiefest power for the increase of knowledge, there is a source of weakness. In works done by dissimilar and independent minds, dispersed in different fields of study, or only gathered into self-assorted groups, there is apt to be discord and great waste of power. There is, therefore, need that the workers should from time to time be brought to some consent and unity of purpose; that they should have opportunity for conference and mutual criticism, for mutual help and the tests of free discussion. This it is which, on the largest scale and most effectually, our Congress may achieve; not, indeed, by striving after a useless and happily impossible uniformity of mind or method, but by diminishing the lesser evil of waste and discord which is attached to the far greater good of diversity and independence. Now, as in numbers and variety the Congress may represent the whole multitude of workers everywhere dispersed, so in its gathering and concord it may represent a common consent that, though we may be far apart and different, yet our work is and shall be essentially one; in all its parts mutually dependent, mutually helpful, in no part complete or self-sufficient. We may thus declare that as we who are many are met to be members of one body, so our work for science shall be one, though manifold; that as we, who are of many nations, will, for a time, forget our nationalities and will even repress our patriotism, unless for the promotion of a friendly rivalry, so will we in our work, whether here and now or everywhere and always, have one end and one design—the promotion of the whole science and whole art of healing.

It may seem to be a denial of this declaration of unity that, after this general meeting, we shall separate into sections more numerous than in any former Congress. Let me speak of these sections to defend them; for some maintain that, even in such a division of studies as these may encourage, there is a mischievous dispersion of forces. The science of

medicine, which used to be praised as one and indivisible, is broken up, they say, among specialists, who work in conflict rather than in concert, and with mutual distrust more than mutual help.

But let it be observed that the sections which we have instituted are only some of those which are already recognised, in many countries, in separate societies, each of which has its own place and rules of self-government and its own literature. And the division has taken place naturally in the course of events which could not be hindered. For the partial separation of medicine, first from the other natural sciences, and now into sections of its own, has been due to the increase of knowledge being far greater than the increase of individual mental power.

I do not doubt that the average mental power constantly increases in the successive generations of all well-trained peoples; but it does not increase so fast as knowledge does, and thus, in every science, as well as in our own, a small portion of the whole sum of knowledge has become as much as even a large mind can hold and duly cultivate. Many of us must, for practical life, have a fair acquaintance with many parts of our science, but none can hold it all; and for complete knowledge, or for research, or for safely thinking-out beyond what is known, no one can hope for success unless by limiting himself within the few divisions of the science for which, by nature or by education, he is best fitted. Thus, our division into sections is only an instance of that division of labour which, in every prosperous nation, we see in every field of active life, and which is always justified by more work better done.

Moreover, it cannot be said that in any of our sections there is not enough for a full strong mind to do. If anyone will doubt this, let him try his own strength in the discussions of several of them.

In truth, the fault of specialism is not in narrowness, but in the shallowness and the belief in self-sufficiency with which it is apt to be associated. If the field of any specialty in science be narrow, it can be dug deeply. In science, as in mining, a very narrow shaft, if only it be carried deep enough, may reach the richest stores of wealth and find use for all the appliances of scientific art. Not in medicine alone, but in every department of knowledge, some of the grandest results of research and of learning, broad and deep, are to be found in monographs on subjects that, to the common mind, seemed small and trivial.

And study in a Congress such as this may be a useful remedy for self-sufficiency. Here every group may find a rare occasion, not only for an opportune assertion of the supreme excellence of its own range and mode of study, but for the observation of the work of every other. Each section may show that its own facts must be deemed sure, and that by them every suggestion from without must be tested; but each may learn to doubt every inference of its own which is not consistent with the facts or reasonable belief of others; each may observe how much there is in the knowledge of others which should be mingled with his own; and the sum of all may be the wholesome conviction of all, that we cannot justly estimate the value of a doctrine in one part of our science till it has been tried in many or in all.

We were taught this in our schools; and many of us have taught that all the parts of medical science are necessary to the education of the complete practitioner. In the independence of later life, some of us seem too ready to believe that the parts we severally choose may be self-sufficient, and that what others are learning cannot much concern us. A fair study of the whole work of the Congress may convince us of the fallacy of this belief. We may see that the test of truth in every part must be in the patient and impartial trial of its adjustment with what is true in every other. All perfect organisations bear this test; all parts of the whole body of scientific truth should be tried by it.

Moreover, I would not, from a scientific point of view, admit any estimate of the comparative importance of the several divisions of our science, however widely they may differ in their present utilities. And this I would think right, not only because my office as President binds me to a strict impartiality and to the claim of freedom of research for all, but because we are very imperfect judges of the whole value of any knowledge, or even of single facts. For every fact in science, wherever gathered, has not only a present value, which we may be able to estimate, but a living and germinal power of which none can guess the issue.

It would be difficult to think of anything that seemed less likely to acquire practical utility than those researches of the few naturalists who, from Leeuwenhoek to Ehrenberg, studied the most minute of living things, the Vibronides. Men boasting themselves as practical might ask, "What good can come of it?" Time and scientific industry have answered, "This good: those researches have given a more true form to one of the most important practical doctrines of organic chemistry; they have introduced a great beneficial change in the most practical part of surgery; they are leading to one as great in the practice of medicine; they concern the highest interests of agriculture, and their power is not yet exhausted."

And as practical men were, in this instance, incompetent judges of the value of scientific facts, so were men of science at fault when they missed the discovery of anaesthetics. Year after year the influences of laughing gas and ether were shown: the one fell to the level of the wonders displayed by itinerant lecturers, students made fun with the other; they were the merest practical men, men looking for nothing but what might be straightway useful, who made the great discovery which has borne fruit not only in the mitigation of suffering, but in a wide range of physiological science.

The history of science has many similar facts, and they may teach that any man will both be wise and dutiful if he will patiently and thoughtfully do the best he can in the field of work in which, whether by choice or chance, his lot is cast. There let him, at least, search for truth, reflect on it, and record it accurately; let him imitate that accuracy and completeness of which I think we may boast we have, in the descriptions of the human body, the highest instance yet attained in any branch of knowledge. Truth so recorded cannot remain barren.

In thus speaking of the value of careful observation and records of facts, I seem to be in agreement with the officers of all the sections; for, without any intended consent, they have all proposed such subjects for discussion as can be decided only by well-collected facts and fair direct inductions from them. There are no questions on theories or mere doctrine. This, I am sure, may be ascribed, not to any disregard of the value of good reasoning or of reasonable hypotheses, but partly to the just belief that such things are ill-suited for discussion in large meetings, and partly to the fact that we have no great opponent schools, no great parties named after leaders or leading doctrines about which we are in the habit of disputing. In every section the discussions are to be on definite questions, which, even if they be associated with theory or general doctrines, may yet be soon brought to the test of fact; there is to be no use of doctrinal touchstones.

I am speaking of no science but our own. I do not doubt that in others there is advantage in dogma, or in the guidance of a central organising power, or in divisions and conflicting parties. But in the medical sciences I believe that the existence of parties founded on dominant theories has always been injurious; a sign of satisfaction with plausible errors, or with knowledge which was even for the time imperfect. Such parties used to exist, and the personal histories of their leaders are some of the most attractive parts of the history of medicine; but, although in some instances an enthusiasm for the master-mind may have stirred a few men to unusual industry, yet very soon the disciples seem to have been fascinated by the distinctive doctrine, content to bear its name, and to cease from active scientific work. The dominance of doctrine has promoted the habit of inference, and repressed that of careful observation and induction. It has encouraged that fallacy to which we are all too prone, that we have at length reached an elevated sure position on which we may rest, and only think and guide. In this way specialism in doctrine or in method of study has hindered the progress of science more than the specialism which has attached itself to the study of one organ or of one method of practice. This kind of specialism may enslave inferior minds: the specialism of doctrine can enchant into mere dreaming those that should be strong and alert in the work of free research.

I speak the more earnestly of this because it may be said, if our Congress be representative, as it surely is, may we not legislate? May we not declare some general doctrines which may be used as tests and as guides for future study? We had better not.

The best work of our International Congress is in the clearing and strengthening of the knowledge of realities; in bringing, year after year, all its force of numbers and varieties of minds to press forward the demonstration and diffusion

of truth as nearly to completion as may from year to year be possible. Thus, chiefly, our Congress may maintain and invigorate the life of our science. And the progress of science must be as that of life. It sounds well to speak of the temple of science, and of building and crowning the edifice. But the body of science is not as any dead thing of human work, however beautiful; it is as something living, capable of development and a better growth in every part. For as in all life the attainment of the highest condition is only possible through the timely passing-by of the less good, that it may be replaced by the better, so is it in science. As time passes, that which seemed true and was very good becomes relatively imperfect truth, and the truth more nearly perfect takes its place.

We may read the history of the progress of truth in science as a paleontology. Many things which, as we look far back, appear, like errors, monstrous and uncouth creatures, were, in their time, good and useful, as good as possible. They were the lower and less perfect forms of truth which, amid the floods and stifling atmospheres of error, still survived; and just as each successive condition of the organic world was necessary to the evolution of the next following higher state, so from these were slowly evolved the better forms of truth which we now hold.

This thought of the likeness between the progress of scientific truth and the history of organic life may give us all the better courage in a work which we cannot hope to complete, and in which we see continual and sometimes disheartening, change. It is, at least, full of comfort to those of us who are growing old. We that can read in memory the history of half a century might look back with shame and deep regret at the imperfections of our early knowledge if we might not be sure that we held, and sometimes helped onward, the best things that were, in their time, possible, and that they were necessary steps to the better present, even as the present is to the still better future. Yes—to the far better future; for there is no course of nature more certain than is the upward progress of science. We may seem to move in circles, but they are the circles of a constantly ascending spiral; we may seem to sway from side to side, but it is only as on a steep ascent which must be climbed in zig-zag.

What may be the knowledge of the future none can guess. If we could conceive a limit to the total sum of mental power which will be possessed by future multitudes of well-instructed men, yet could we not conceive a limit to the discovery of the properties of materials which they will bend to their service. We may find the limit of the power of our unaided limbs and senses; but we cannot guess at a limit to the means by which they may be assisted, or to the invention of instruments which will become only a little more separate from our mental selves than are the outer sense-organs with which we are constructed.

In the certainty of this progress, the great question for us is what shall we contribute to it? It will not be easy to match the recent past. The advance of medical knowledge within one's memory is amazing, whether reckoned in the wonders of the science not yet applied, or in practical results in the general lengthening of life, or, which is still better, in the prevention and decrease of pain and misery, and in the increase of working power. I cannot count or recount all that in this time has been done; and I suppose there are very few, if any, who can justly tell whether the progress of medicine has been equal to that of any other great branch of knowledge during the same time. I believe it has been; I know that the same rate of progress cannot be maintained without the constant and wise work of thousands of good intellects; and the mere maintenance of the same rate is not enough, for the rate of progress of science should constantly increase. That in the last fifty years was at least twice as great as that in the previous fifty. What will it be in the next, or, for a more useful question, what shall we contribute to it?

I have no right to prescribe for more than this week. In this let us do heartily the proper work of the Congress, teaching, learning, discussing, looking for new lines for research, planning for mutual help, forming new friendships. It will be hard work if we will do it well; but we have not met for mere amusement or for recreation, though for that I hope you will find fair provision, and enjoy it the better for the work preceding it.

And when we part let us bear away with us, not only much more knowledge than we came with, but some of the lessons

for our conduct in the future which we may learn in reflecting the work of our Congress.

In the number and intensity of the questions brought before us, we may see something of our responsibility. If we could gather into thought the amounts of misery or happiness, of helplessness or of power for work, which may depend on the answers to all the questions that will come before us, this might be a measure of our responsibility. But we cannot count it; let us imagine it; we cannot even in imagination exaggerate it. Let us bear it always in our mind, and remind ourselves that our responsibility will constantly increase. For, as men become in the best sense better educated, and the influence of scientific knowledge on their moral and social state increases, so, among all sciences there is none of which the influence, and, therefore, the responsibility will increase more than ours; because none more intimately concerns man's happiness and working power.

But, more clearly in the recollections of the Congress, we may be reminded that in our science there may be, or, rather, there really is, a complete community of interest among men of all nations. On all the questions before us we can differ, discuss, dispute, and stand in earnest rivalry; but all consistently with friendship, all with readiness to wait patiently till more knowledge shall decide which is right. Let us resolutely hold to this when we are apart: let our internationality be a clear abiding sentiment, to be, as now, declared and celebrated at appointed times, but never to be forgotten; we may, perhaps, help to gain a new honour for science, if we thus suggest that in many more things, if they were as deeply and dispassionately studied, there might be found the same complete identity of international interests as in ours.

And then, let us always remind ourselves of the nobility of our calling. I dare to claim for it, that among all the sciences, ours, in the pursuit of truth, offers the most complete and constant union of those three qualities which have the greatest charm for pure and active minds—novelty, utility, and charity. These three, which are sometimes in so lamentable disunion, as in the attractions of novelty without either utility or charity, are in our researches so combined that, unless by force or wilful wrong, they hardly can be put asunder. And each of them is admirable in its kind. For in every search for truth we can only exercise curiosity, and have the delight—the really elementary happiness—of watching the unveiling of a mystery, but, on the way to truth, if we look well around us, we shall see that we are passing among wonders more than the eye or mind can fully apprehend. As one of the perfections of nature is that, in all her works, wonder is harmonised with utility, so is it with our science. In every truth attained there is utility either at hand or among the certainties of the future. And this utility is not selfish; it is not in any degree correlative with money-making; it may generally be estimated in the welfare of others better than our own.

Some of us may, indeed, make money and grow rich; but many of those that minister even to the follies and vices of mankind can make much more money than we. In all things costly and vainglorious they would far surpass us if we would compete with them. We had better not compete where wealth is the highest evidence of success; we can compete with the world in the nobler ambition of being counted among the learned and the good who strive to make the future better and happier than the past. And to this we shall attain if we will remind ourselves that, as in every pursuit of knowledge there is the charm of novelty, and in every attainment of truth utility, so in every use of it there may be charity. I do not mean only the charity which is in hospitals or in the service of the poor, great as is the privilege of our calling in that we may be its chief ministers; but that wider charity which is practised in a constant sympathy and gentleness, in patience and self-devotion. And it is surely fair to hold that, as in every search for knowledge we may strengthen our intellectual power, so in every practical employment of it we may, if we will, improve our moral nature; we may obey the whole law of Christian love, we may illustrate the highest induction of scientific philanthropy.

Let us, then, resolve to devote ourselves to the promotion of the whole science, art, and charity of medicine. Let this resolve be to us as a vow of brotherhood; and may God help us in our work.

Original Communications.

CALCULUS IN THE FEMALE BLADDER. (a)

By ANGUS MACDONALD, M.D., F.R.C.P., F.R.S.E.
Physician to, and Clinical Lecturer on, Diseases of Women, Royal Infirmary, Edinburgh.

THE following case presents several points of interest which appear to me such as warrant its being brought before the notice of this Society, and being made the text of some observations upon this important subject.

The patient was a domestic servant, residing at Bathgate, et. 18. She was admitted into ward 23, Royal Infirmary on the 28th of February, 1881, complaining of frequency of micturition, which was at the same time associated with great pain.

The increase in frequency had been progressive, the act being now performed every half-hour or thereabouts. The pain also had gradually become more intense.

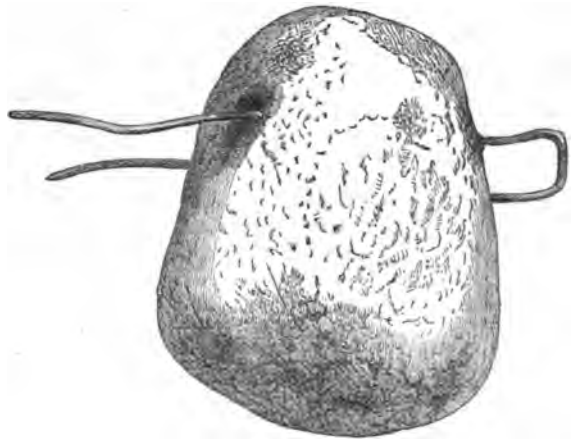

Her menstruation began at sixteen; was of a twenty-eight days type, and usually continued a week. With the exception of the urinary system, the patient on admission presented a clean bill of health. On physical examination it was observed that both labia minora were loose, long, pendulous, and prominent. The hymen, though only slightly notched on right and left, was readily distensible, and annular in shape. The patient, notwithstanding these peculiarities, denied emphatically the practice of masturbation. The urethral orifice appeared perfectly normal. There was some scalding of the insides of the thighs, and a urinous disagreeable odour about the patient and her clothes.

The vagina was observed to be loose and roomy, admitting two fingers. The uterus was felt to be displaced towards the right and posteriorly. The vaginal portion of the cervix was soft, and the outer os patulous, but so far as uterus could be explored, it seemed otherwise normal. The sound entered its cavity $2\frac{1}{2}$ inches, and caused no pain.

Projecting against the anterior vaginal wall, but situated more towards the left than the right, and displacing the uterus, as above described, there was found a mass of stoney hardness, about the size of a goose's egg, somewhat flattened from before backwards. This mass projected close to the upper end of the urethra, and over its surface the bladder wall appeared to be moveable. On touching the mass with a sound introduced through the urethra, a grating noise was heard, and the instrument was felt to impinge against a rough stony surface. Examination of the urine proved that its reaction was alkaline, and that it contained a copious amount of crystals of the triple phosphate, some pus cells, and also a few crystals of oxalate of lime.

It being now clear that we had to deal with a vesical calculus, the question how it should be removed had to be determined. It was clearly too large to think of removal by dilatation of the urethra. The operation of lithotripsy might have been tried, but would have been somewhat difficult on account of the size of the stone. Further, it would have been fraught with danger on account of the extreme condition of irritability in which the mucous membrane of the bladder was found; and, moreover, we feared the presence of a troublesome nucleus, as so frequently occurs in such cases. The operation of vaginal lithotomy, on the other hand, being exceedingly easy in the adult female, presented the most favourable solution of the problem. Accordingly, the last proceeding was resolved upon, and on the 2nd of March proceeded with in the following manner:—The patient having been anaesthetised, was placed in the semi-prone position. The perineum was drawn back by means of a Sim's speculum. A sound was introduced through the urethra, and its point made to project against the base of the bladder in the mesial line, half an inch or so from the neck of the organ. The point of the sound was now cut down upon

by the stroke of a pair of scissors. The one blade of a probe-pointed straight scissors was now passed through the opening into the bladder, while the other occupied the vagina. The opening was extended backwards in the mesial line in the direction of the cervix uteri for fully $1\frac{1}{2}$ inches. I ought to have observed that when the patient was put under chloroform for the operation, and I was able to manipulate the tumour freely (which I could not do on the day of her admission, on account of the excruciating pain complained of), it was noticed that the anterior lower part of it was more moveable than the rest. The impression conveyed to my mind was that a portion had broken loose from the main mass of the calculus, or that there were two stones. On opening the bladder, however, I found I had been mistaken, for so soon as I passed my finger into its cavity I found it pricked through coming in contact with one of the sharp ends of this hair-pin (stone shown, *vide* drawing). With some difficulty I

managed to guide the two ends of the pin so as to bring them both out at the wound. Originally they had pointed more forwards than the anterior angle of the incision, and after an ineffectual attempt to remove the stone by an ordinary lithotomy forceps, I grasped the two free ends of the hair-pin in a strong needle holder, and was able to utilise them so as to facilitate the removal of the stone.

On effecting this object it was found that the mucous membrane of the bladder was so unhealthy, and so encrusted with calcareous deposits, that I resolved not to sew up the wound at once. I washed out the bladder thoroughly with a weak carbolic acid solution, and then had the patient put to bed. The bleeding during the operation was quite inconsiderable, and after the operation it was positively *nil*.

From this date the patient was entirely relieved of her pain. The wound gradually contracted of itself, but after waiting for four weeks in expectation of a complete closure we found there was still an opening at the anterior end of the incision to the extent of about half an inch in length. Accordingly, I then rawed and brought together the edges by means of several twisted silver sutures. A winged catheter with tubing attached to it was passed into the bladder and remained there without causing any inconvenience till the 8th day, when the stitches were removed. The wound was now found to have completely healed. When coloured fluid was passed into the bladder not a trace of it escaped per vaginam. The patient was able to retain her water for four or five hours at a time, had no pain, and was dismissed cured.

The patient at first denied all knowledge of how the hair-pin could have entered her bladder, but on being pressed with questions she confessed to having introduced it about fifteen months previously. At first it gave her little or no annoyance, but gradually she began to experience difficulties in connection with micturition, as already explained.

(a) Read before the Obstetrical Society of Edinburgh.

This case, otherwise interesting in several particulars, appears to me the more appropriate as a contribution to this Society, inasmuch as it represents a subject which has never been considered by it. With the exception of a case of stone in the female bladder successfully removed through the urethra by Dr. Peter Young, an account of which was communicated by him to this Society in May, 1861, the question does not seem to have been dealt with in the course of the existence of the Society.

The fact that stone is a rare affection in the female partly accounts for this. The readiness with which stones of an ordinary size may be removed through the urethra may also be credited with a certain amount of the omissions. There is little doubt that the shortness of the female urethra and its comparatively large calibre, as also the anatomical conditions of the female bladder, which do not give rise to a stagnating pouch as is the case in adult men, are important elements in determining the relative infrequency of the disease. At any rate, there is no question about its being very rare. Various estimates of its relative infrequency are given, most being agreed with Mr. Pollard (a) that it is more than twenty times less frequent in the female than in the male. It would further appear that the infrequency would be still greater were it not for the introduction of foreign bodies into the bladder, which foreign bodies ultimately become nuclei round which calcareous matters are deposited. During the four years in which I have served in the Edinburgh Royal Infirmary and during which a multitude of female disorders have come under my notice, this is the only case of stone in the bladder which I have seen.

I would like in a single line to draw attention to the striking fact that this hair-pin could have lain in this woman's bladder fifteen months, and during some ten of these should have given rise to little uneasiness. This fact is certainly a strange one and goes to support the view which I have held for years, and which was so ably advocated of late before this Society, viz., that the female bladder when empty is not in a state of active contraction but rather of loose collapse. For it stands to reason that if this patient's bladder had been powerfully, or even forcibly, contracted the first time it was emptied after this hair-pin was introduced, it could not fail to have been penetrated by the sharp free ends of the pin. The history of foreign bodies in the bladder includes many similar structures, yet penetration of the bladder wall seems very rare. Thus, needles of various kinds, pins, &c., are frequently found in the bladders of both sexes. Donné, *Moniteur des Hôpitaux* No. 126-7-8, for 1856, adds to the account of a woman who had introduced the handle of a stiletto into her bladder, the particulars of 391 cases. An odd list it makes in all conscience. It includes 78 portions of catheters and lithotripsy instruments, 82 needles, pins, or tags, 6 bone or ivory needles, 6 ear-picks, 3 ivory whistles, 1 ivory spindle, 1 ivory stiletto handle, 15 leaden balls, 3 small keys, and 8 metallic fragments of various kinds, 12 bones or splinters of bone, 10 pieces of pebble or chins, 6 penholders, 15 needle cases, 10 pieces of tobacco pipes, and 4 portions of glass tubing, besides other curious structures that we need not stay to mention. Of course, the catheters and lithotripsy instruments would find their way into the bladder by accident, but the greater portion of the others must have been intentionally introduced under depraved sexual excitement, or for some other foolish reason. It has to be observed that Donné's cases refer to both sexes.

From some more recent observations recorded, as, for instance, *Medical Times and Gazette*, vol. ii., 1865, p. 284, a hair-pin seems a favourite foreign body in the female bladder.

(To be continued.)

(a) Holmes's System of Surgery.

NOTES ON GOUT. (a)

By ANDREW SCOTT MYRTLE, M.D.,
Consulting Physician to the Harrogate Bath Hospital.

I SHALL take it as granted that we are all thoroughly conversant with the cause, symptoms and natural course of an honest acute attack of gout, as it appears in its favourite resorts; certain impurities, principally uric acid, get arrested in their passage through the small vessels, a block is established and the result local inflammation of a specific character, with this there is more or less functional disturbance of the digestive, circulatory and nervous systems, but if left to itself the disease runs a pretty uniform course, the patient's sufferings not being so much in keeping with the severity of the local symptoms as his idiosyncrasy; by and by pain, heat, redness and swelling disappear, and the person is not only as well as ever but, as Dr. Cullen wrote ages ago, "enjoying greater ease and alacrity in the functions of mind and body than he had done for a long time previously." In dealing with all such cases of acute gout, I maintain that any attempt to mitigate the symptoms or cut short the fit by any kind of treatment whatever is a mistake, the patient should be asked to grin and bear, and told simply to rest the part and wrap it up in cotton wool; if the appetite is normal I do not make the slightest change in diet, in fact, I act on the principle of fanning the flame so that the fire shall burn itself out in a legitimate manner and place. By adopting this course, I find patients make good and rapid recoveries, and enjoy better health and a longer interval between their attacks than by any other. Treat such cases with purgatives, alkalies, colchicum, and I grant that the symptoms will be quickly ameliorated, cut short or arrested but what follows, the patient generally does not make so good or rapid recovery, and is more liable to a relapse; or the disease returns at an early date, it may be in a less violent, but also in a less healthy, fashion. The treatment has scotched not killed the snake. I have been speaking of acute gout, as it affects the joints of the hands and feet, we must bear in mind that it does not always confine itself to these parts, but not infrequently seizes on some internal and important organ. The stomach, bowels, kidneys, bladder, heart and brain may suddenly become its seat, the symptoms when such happens are most alarming, and require prompt and powerful measures to be immediately resorted to for their subjugation, unfortunately they are not so readily recognised and thus may be allowed to run a fatal course; one of the most constant features of internal gout is the very marked depression of the ganglionic centres, the patient looks as if he had been the subject of *shock*, such as we witness in severe accidents. What is called flying gout I have generally found associated with a loaded condition of portal system with decided hepatic derangement, and speedily removed by treatment directed to remedy this condition.

Suppressed or poor gout is one of the most unsatisfactory forms either to have or treat—and as far as rheumatic gout goes I have only one remark to make and that is the value I attach to glycerine given instead of sugar with tea, coffee, milk, puddings, or even whiskey punch. It never turns acid, as you know, is miscible with all kinds of food and drink, and as a hydro-carbon acts both as a food and fuel, many have been enabled by its use to pass better winters, and escape attacks of bronchial mischief, which before using it they were prone to.

I need say nothing as to the strong hereditary nature of gout, or to the fact that it frequently appears for the first time in families.

The causes which favour its development are good living, excessive use of stimulants, especially those of a saccharine sort, and indolence, to these I would add bad air—these are allowed to be the common factors of the gouty diathesis, but they are by no means the only ones. I have met with lots of cases where we have neither had

(a) Paper read before the Yorkshire Branch, June 29th, 1881.

hereditary tendency, gross living or intemperate habits with slothfulness to account for it, men and women who have become martyrs to it because they have been subjected to bitter trials, sorrow, anxiety and worry with physical exhaustion, anything which depresses the vital powers may prove the exciting cause of gout, whether one is predisposed to it or not.

Dr. Clifford Allbutt in his address to the Medical Chirurgical Society of the West Riding last session spoke to the fact that gout was frequently found to exist as a neurosis; this year I met with a case which exemplifies this in a remarkable way. During the Indian Mutiny in 1857, a powerful smart young officer was chosen to perform a most difficult, dangerous and arduous duty—he was given important dispatches, and had to carry them 70 miles, through a district infested by rebels; he had to accomplish his journey in one day and return with the answer the next; this he did, but on his reaching headquarters, he was so prostrate he had to be lifted from his horse and carried to his bed; next morning he was removed to the hospital, and shortly after was attacked with acute gout in both great toes, ankles and thumbs. No member of his family was ever known to have suffered from any form of gout, and he has never been very long free from it since. I have several times seen children weakened by acute illnesses, show all the signs of acute gout during the early days of their convalescence without their parents ever having exhibited the slightest trace of being of gouty constitution.

I would ask the question, is gout more frequently met with now in proportion to the increase of the population, than in our own recollection? Like myself some of you may be able to carry your minds back 20, 30 or even 40 years. I shall tell you my professional experience; from 1839 till 1844 I was daily in the habit of seeing patients, as an apprentice and student, in private and hospital practice in Edinburgh—during that time I don't remember seeing one case of acute gout. I never heard one word regarding it from my master or teachers, and in my text books I found it once spoken of as having some connection with stone in the bladder.

From 1844 till 1859, when I was in practice in Scotland, I met with one case of acute primary gout and one case of recurrent. Since 1859 I have been in practice in Harrogate, where gouty patients are sent in hundreds, but these I shall leave out of my calculation, and confine myself to my resident practice, and here I find I have seen on an average about 7 fresh cases per annum, among a class in every way similar to my patients in Scotland, where in 15 years I saw two cases, here I have seen in the same term 105. Among the visitors, I find that Scotland and Ireland furnish more gouty cases than England. I mention this because, about the year 1760 Dr. Gregory, the most celebrated physician of his day, and Professor of Practice of Physic in Edinburgh University, whilst on a visit to London, assured his medical friends that, during his life he had only seen two cases of gout. All this time it was very common in London. The fact that Dr. G. only saw two cases shows that the disease must have been almost unknown in the North a hundred years ago, and now every Scotch village surgeon is as familiar with it as we are. Has gout increased in like ratio in England? I am fully persuaded it has, and is rapidly on the increase. What can we attribute this increase to?

1st. I would observe that English and Scotch have been for centuries given to strong drink, and, whenever they could get it, fond of good living. Too much value has been attached to Abernethy's remedy against gout—"Live on sixpence a day, and earn it." We must fall back on other factors of gout than alcoholic drinks and generous diet, and ask ourselves, Are there at present any conditions of life in operation which did not exist during our grandfathers' time, and can those conditions in any way account for the increase of certain diseases, among which gout holds a prominent place? I think the answer is not far to seek; our whole conditions of life and mode of

transacting both public and private business have changed. Our ancestors led comparatively sleepy lives; they had none of that constant mental excitement and physical hurry-scurry which must be kept up in these days if any one desires to be in the race; consequently, they felt nothing of the strain put on mind and body, and the exhaustion induced in both, which we commonly meet with; and to this exhaustion of nerve force I think we may reasonably attribute a portion of the victims of gout.

I would point to another possible cause, one which, in my own mind, I have little doubt about, and that is, excessive tea-drinking. Let me call your attention to the following facts in regard to the increase of gout and the consumption of this article. Tea, you all know, was introduced into this country about 200 years ago. For long it was only to be met with as a curiosity, and was not found in any but the houses of the rich as a common beverage, early in this century—in fact, until the monopoly, which the East India Company held regarding its importation, was abolished in 1833, tea-drinking was not to be seen in every dwelling, and it is at least remarkable that since 1833 gout has increased enormously. I must confess that I think Richard Cobden was not far wrong when he expressed his opinion that tea was a slow poison which would lead to the rapid degeneracy of the race, and I have long felt convinced that I have seen as much mischief result from intemperance in tea-drinking as I have from dram-drinking.

In conclusion, let me say a few words on a new tap opened for the sole benefit of the thirsty public. I shall be curious to watch what may happen during the next ten years after we have got our systems fairly saturated with those marvellous drinks which Limited Liability introduces to us, those beautiful, sparkling, refreshing, and invigorating beverages at 5s. 6d. per dozen, more agreeable than champagne, and, in my opinion, a hundredfold more injurious. In those trashy compounds I believe we shall find a new source of dyspeptic torments and an additional factor of gout. I once was bullied into tasting some stuff with a fine sounding name and gorgeous get-up—from the little sip I took I can honestly advise every one who has any respect for his inside to avoid all drinks whose names, whatever their beginnings, end with the letters L. N. E., O. N. E., or A. D. E., and stand by the good old-fashioned beverages of our youth. If stimulants are to be taken, and I believe to a certain extent they are necessary, you will find sound beer, good wine, and old spirit more wholesome, more suitable to the climatic conditions under which we live, than any other and not one whit more gouty.

ANOREXIA NERVOSA.

By THOMAS STRETCH DOWSE, M.D., F.R.C.P., Ed.
Physician to the Hospital for Epilepsy and Paralysis; formerly
Physician Superintendent Central London Sick Asylum.

SIR WILLIAM GULL, in an address on medicine delivered at Oxford in the autumn of 1868, (a) was the first physician in this country to draw the attention of the profession to the more special features and correct treatment of this disease, and again in the year 1874 we find in the *Clinical Society's* "Transactions" another paper on this subject by the same physician. Dr. Lacéque wrote upon anorexia hysteria about the same time, and his observations may be found in the *Medical Times and Gazette* for September 27, 1873. Dr. Whytt, in his works, writes of a "nervous atrophy." He says a marasmus or sensible wasting of the body, not attended by sweating or any considerable increase of the excretions by urine or stool, a quick pulse or feverish heat, may deserve the name nervous, and this disease seems to proceed in a great measure, if not solely, from some change in the nerves of the stomach and bowels. Dr. Fenwick, in his excellent work "On Atrophy of the

(a) *Lancet*, August 1868.

Stomach," devotes a chapter or two to "anorexia nervosa," and he gives notes of many cases which go to prove how little is known of this affection. For instance, Dr. Fenwick cites the case of a girl, of 15 years, suffering from this disease, and who was stated by a physician to be dying of consumption, but who rapidly recovered upon being compelled to take nourishment frequently. He also quotes the case of a girl, aged twelve years, who was admitted into the London Hospital, and said to be suffering from tubercular meningitis, but she got perfectly well after forcible feeding was had recourse to. Dr. Fenwick states that anorexia nervosa seems to be confined to young persons, the oldest he has met with being only 25 years of age. I have, however, seen exceptions to this statement, and I shall give one case at the end of my paper. Dr. Forbes Winslow has considered this affection from a psychological point of view (and so have most psychologists) in his recent work entitled "Fasting and Feeding Psychologically Considered." This work is full of literary and general information, but it does not refer especially to the particular class of cases which we now have under consideration.

Sir William Gull says that the subjects of this affection are mostly of the female sex, although it may occasionally be found in males, and Dr. Fenwick states that it is much more common among the wealthier classes than amongst those who have to procure their bread by daily labour. In reference to the pathology of this disease very little seems to be known. In a case of Dr. Fenwick's (a young man of 19 years), on post-mortem examination all the organs were found healthy excepting the cæcum, where a small ulceration existed.

In a case of Dr. Wilks, where death occurred, he says: "On a most careful search through the body not a particle of disease of any kind was found, the intestine was healthy throughout, and indeed from the necropsy alone it would have been difficult to have discovered the cause of death." Sir William Gull (Clinical Society's "Transactions," 1874) says: "Although the two cases I have given have ended in recovery, my experience supplies one instance at least of fatal termination to this malady, where the post-mortem examination itself revealed no more than thrombosis of the femoral veins, which appeared to be coincident with œdema of the lower limbs." Death apparently followed from starvation alone.

In the recorded post-mortem examinations of the distinguished physicians whom I have just quoted, I do not think sufficient attention has been paid to the microscopical examination of the nervous system, and particularly of the medulla oblongata, and although I consider the term "anorexia nervosa" very appropriate, yet I cannot help thinking that in many of these cases there is some functional derangement of the pneumogastric nerve, such in fact as may warrant the use of the term "pneumogastric neurose," but I cannot lay stress upon this point from any other than clinical observation, and a few rare instances where the pneumogastric nerve upon post-mortem examination has been found diseased. Dr. Johnson, in the year 1837, publishes in the "Economy of Health," a very interesting case of anorexia nervosa, which appeared to be due to organic disease of the brain. "The sister," he says, "of the celebrated Mrs. Siddons (Mrs. Whitlock) died under my care from starvation without its attendant sufferings of hunger and thirst. An aneurismal enlargement of the vessel in the brain pressed upon the origins of two particular nerves—the eighth and ninth—those which give power to speech, swallowing, and digestion; the consequence was an inability to speak, to swallow, and to digest. Fortunately, the paralysis of one of these nerves (the eighth) prevented the sense of hunger, and though this unfortunate lady lived five weeks after the failure of swallowing was complete, she suffered not from hunger or thirst." Dr. Forbes Winslow, in his work just referred to, says: "The student of mental diseases is in a good position for estimating the effect of fasting on the animal frame. There are few among the patients who pass under his notice that do not at some

time or other exhibit the features peculiar to this condition; the records of asylum physicians are full of them; and there are to be found in them the accounts of phases and moods that will repay minute investigation.

Dr. Fenwick, in writing upon the pathology of "Anorexia Nervosa," says: "The emaciation forms a remarkable contrast to the large amount of fat always present in the subjects of atrophy of the stomach, whereas in the disorder we are now considering the blood is starved of all its constituents, whilst in degeneration of the gastric glands only the albuminous materials are defective, and the fat consequently accumulates on the tissues."

From the statements which I have just made relative to the observations of others concerning the nature of this disease, I think there can be little doubt that it is engendered through an arrest of function on the part of certain nerves, similar to what we find in hysteria, catalepsy, and some forms of melancholia, and that this arrest of function is more pronounced in these cases in the pneumogastric nerves, and possibly in the medulla oblongata itself.

Schroeder Van der Kolk (a) states that in cases of melancholia, with increased desire for food, he has generally, at the same time, observed a great irritation of the medulla oblongata, so that pressure on the upper part of the neck could not be borne; also that he has proved pathologically that when the pneumogastric nerves have been inflamed, irritated, or softened, there has been a more or less complete absence of the feeling of hunger. This learned psychologist believes that these conditions of anorexia and melancholia are not unfrequently brought about by an overloaded state of the colon with retained fæces and masses of scybala, and with a general engorgement of the chylopoietic circulation, or from undue sexual excitation. I should say, from my own experience, that such a conclusion is highly probable, and I believe that if many of these cases were treated primarily by aloetic purgation, and less sympathy on the part of immediate relatives, we should hear very little more about them.

The following case, which came under my care in the summer of last year, is highly interesting and extremely typical in its main features of anorexia nervosa.

A. T., æt. 14, was admitted into the Hospital for Epilepsy and Paralysis on July 6, 1880, with the following history:—

Her parents are healthy and strong persons, so are her brothers and sisters.

There was no difficulty about her birth, but she was considered a very delicate child; and during infancy cod-liver oil was given to her because of weakness.

Although delicate, thin, and weak, she has never, until the affliction from which she has, it is hoped, now permanently recovered, suffered any serious illness, excepting the measles when about 8 or 9 years of age.

About two years ago, however, a number of small boils erupted upon several parts of her body, particularly about the region of the anus and the back of the thighs. She also at the same time had a swelling from the throat. She was taken to a medical man, and he said the nature of her "constitution" caused the eruptions. Some medicine was given to her, and the swelling from the throat was painted; and in a short time the eruption and the swelling disappeared, never having been seen before, and have not been seen since.

In the early part of last summer she began to decline, said that she could not swallow food, and exhibited great obstinacy of disposition. The advice of a doctor was obtained, but she refused to take his physic; or if she did take any at all it was at very irregular periods, few and far between. She would cry at the slightest opposition to her wishes, and often without any apparent reason. Being a delicate child, she had always been treated with more indulgence than the rest of the family. She had, in fact, been allowed to do nearly as she liked; and in her sullen fits at this time she would never speak to her mother

(a) Mental Diseases, Schroeder Van der Kolk.

except in tones of the greatest insolence. She grew from bad to worse; and in February last she went thirteen days without taking anything besides a little water—at least, not to anybody's knowledge. She became so weak that her parents sat up with her for nearly a week; and one night they thought she was dying. It is supposed she had a fit on one occasion, and it was thought she was dead. After this, her mother used an enema to her; but this caused her great pain, and its use was discontinued. Somehow or other, after this she grew stronger, and was able to partially dress herself, and later on to come down stairs with only slight assistance, while for some time before she had been carried up and down. As before remarked, she was very sullen. She would never begin a conversation, nor join in one; and it would sometimes be difficult to get a reply from her, even in a monosyllable.

Her father proposed several times on doctors' advice and his own judgment to obtain admission for her into the County Hospital at Colchester; but his propositions came to nought, for it was protested right and left that the girl would never endure the journey.

She remained in the same condition for some time—sometimes a little better, sometimes a little worse, sometimes eating a little, but oftener nothing at all for days—till about the middle of May last, when she expressed a strong wish to go to London to see her brother. The doctor advising that her wish should be gratified, she accordingly was brought to London, having to be supported and lifted in and out of the different conveyances. Her brother and his wife tried what a little firmer treatment would do, and as far as it went it succeeded pretty well. They resolved to try her with beef-tea. At first she resolutely declined, as usual, to take it; and quiet means failing, they proceeded to employ force. And the girl struggled violently, so much so that she laid on the floor before she was overcome, causing them to be greatly astonished at such an unlooked-for display of strength. Eventually the liquid was forced down her throat. After this scene she took beef-tea twice a day, freely, though slowly; but she could not be induced to take more solid food. Gentle persuasion and stern command were equally unsuccessful. She would cry incessantly, and moan and whine in a most distressing manner, particularly when her mind was unoccupied. It was found she was better when her mind was engaged, and she was therefore kept employed as much as possible.

(To be continued.)

Clinical Records.

ST. BARTHOLOMEW'S HOSPITAL.

Two Cases of Sarcoma of the Maxilla—Removal—Recovery.

Under the care of Mr. MORRANT BAKER.

Reported by SIDNEY DAVIES, B.A.

1. *Sarcoma of Lower Jaw—Removal—Apparent Recurrence in Upper Jaw.*—William B., æt. 16, was first admitted into St. Bartholomew's Hospital on Aug. 16, 1878, under the care of Mr. Baker. He was a sailor by occupation.

The patient stated that whilst in Japan a tumour was taken away from the right side of his lower jaw; that was about the middle of April. He didn't notice any return of it until after he returned to England.

On admission he was found to have a scar just below the body of the jaw of the right side, which ran from near the angle to the mental foramen. The bone could be traced without interruption from the symphysis to the angle, and the whole moved together when he opened and shut his mouth. It was thought that there might be some loss of bone on the outer side of the jaw, but it could not be certainly determined. The molar teeth were gone. The cheek was full and soft, much more prominent than on the right side. In the parotid region there was a slight swelling of

firm consistence, very ill defined. No distinct tumour could be felt. There was no enlargement of the neighbouring glands. The patient did not complain of any pain, nor did he give any history of injury. The family history was good, and he himself had enjoyed previous good health.

A linseed poultice was ordered to be applied to the right cheek.

On the 22nd August the patient was taken into the theatre for a consultation. The general opinion was that the swelling was due to inflammatory infiltration and thickening of the soft parts, and it was decided to continue poulticing and to watch the case. Some of Mr. Baker's colleagues, however, thought that there was a recurrence of the tumour that had been removed.

The following notes were subsequently made on the case:—

Sept. 4th.—The right cheek is slightly warmer than the left. The swelling has slightly increased during the last few days.

12th.—The cheek is evidently more swollen than on admission. A firm swelling projects from the entire outer surface of the right ramus of the lower jaw, which is most prominent just below the coronoid process. The cheek is not adherent to the tumour.

Mr. Baker again took the patient to the theatre for consultation with his colleagues, when an unanimous opinion was expressed that the swelling was a recurrent tumour of the lower jaw, and it was advised to remove the entire right half of the jaw.

14th.—Mr. Baker removed the right half of the inferior maxilla from the lateral incisor to the condyle. There was very free hæmorrhage from the deep parts after the removal, which was stopped by the application of the cautery and perchloride of iron. The usual mode of operating for removal of the lower jaw was adhered to, and carbolised catgut sutures were used. A tolerably firm sarcomatous tumour occupied the ramus of the jaw; it was about 2½ inches long and ¾ inch thick. The bone was expanded in the form of a thin shell on either side of it, and between the bone and the tumour was a thin layer of cartilage.

15th.—Temp., 102.3; pulse, 121. No hæmorrhage.

16th.—The cheek is somewhat swollen. Temp., 100.8; pulse, 108.

17th.—Cheek rather more swollen. The incision looks a little red and tense. Temp., 102; pulse, 108.

18th.—Temp., 101.

20th.—Temp., 101.1. The cheek is less swollen. There is a purulent discharge through the centre of the incision.

22nd.—Tumour examined microscopically; it consisted of a somewhat abundant connective tissue reticulum, enclosing small round cells. There were numerous small hæmorrhages into the substance of the tumour. *Diagnosis*—Round-celled sarcoma. There were no myeloid cells.

Oct. 14th.—Wound nearly healed. Patient is up. To-day an erysipelatous blush was noticed about the wound. The patient recovered from the erysipelas and was discharged cured. He remained well for two years.

On May 11th, 1881, he was again admitted into the hospital. He said that about six months ago he noticed a swelling on the front of the right superior maxilla. It increased in size slowly, and on admission formed a rounded prominence of the cheek.

The tumour appeared to spring from the front of the maxilla. It could be felt in the mouth external to the alveolus, but it made no swelling on the palate. The right nostril was free, and the floor of the orbit was not invaded. The tumour was firm, and even on the surface not movable, and not adherent to the soft parts over it. There was no glandular enlargement, and the patient's health was robust. The scar of the last operation was sound. There was no reproduction of bone. At a consultation it was unanimously recommended to remove the upper jaw.

18th.—Operation. Mr. Baker laid back the cheek as for the major operation for removing the upper jaw. The tumour, however, which was attached to the scar of the former operation, was chiefly seated in the pterygo maxillary and spheno-maxillary fossæ, and, after some trouble, the tumour, which had well-defined walls, was enucleated quite clearly from the parts in which it was embedded. The superior maxilla was not itself affected; the appearance of its being affected, which existed before the operation, was due to the tumour having pressed on and flattened the pos-

terior and external walls of the bone, so that the convex surface had been made concave.

23rd.—Wound quiet and closing well.

June 4th.—The wound has healed throughout, leaving very little deformity. Patient discharged healed.

Remarks.—The interest of this case mainly centres in the apparent recurrence in the upper jaw of a sarcomatous growth removed with the lower jaw. The event proved that the anomaly was only apparent. Mr. Baker made his incisions such, that, in the event of the tumour being, as it proved to be, disconnected with the upper jaw, it might be separated without injuring the jaw; the result showed that he was right in so doing.

2. *Sarcoma of Upper Jaw encroaching on Orbit—Removal—Recovery after Abcission.*—Miles C., st. 48, gunsmith, was admitted into St. Bartholomew's Hospital on May 26, with the following history:—

In February last he first noticed a swelling on the cheek. Early in May he went to the Leicester Infirmary where he was advised to have the upper jaw removed; but as the senior surgeon of the Infirmary thought the disease cystic, a puncture was made in the palate, and blood was evacuated. He refused, however, to be operated on in Leicester Infirmary.

Condition on admission.—There is a tumour of the right upper jaw. It forms a prominent swelling on the cheek, which extends backwards to the zygomatic suture. It deflects the nose to the left, and the outer wall of the right meatus is seen to be in contact with the septum. The tumour is felt to encroach to a slight extent upon the floor of the orbit. The right eye is raised so that the lower border of the right iris is on a level with the lower border of the left pupil. There is some œdema of the lower lid. The conjunctiva is slightly suffused, and the patient says that the eye pricks when the lids are long open. The tumour encroaches on the gums corresponding to right alveolar border, and all the upper teeth of that side are loosened. There is a rounded swelling on the hard palate close to the right alveolus, and when one finger is laid on the cheek and another on the swelling of the palate, fluctuation is obtained between the two. All other parts of the tumour are firm. There is no glandular enlargement. The patient suffers occasional pains in the cheek. There was no family history of cancer or tumour.

The patient had always been well until the time of the Afghan campaign, when he got intermittent fever.

On May 30th Mr. Baker removed the upper jaw by the major operation under chloroform. Three lint plugs were inserted, and the lips of the wound united by silver and horse-hair suture, and one hair-lip pin. Patient was very faint after the operation.

31st.—The three plugs were removed in the afternoon. The wound was syringed with solution of Condy's fluid. Temperature rose after the operation from normal to 100° 3. To-day, morning temperature, 100° 5; evening, 102° 2.

June 1st.—Temp., morning, 101° 6; evening, 104° 4. Slept well. Hair-lip pin removed.

3rd.—Temp., 102. There is a small ulcer on the upper segment of the cornea. Slight conjunctivitis. Ordered weak solution of atropine to eye, and

Hausus quina. ter die

Wound quiet.

4th.—Conjunctiva more inflamed. Ulcer spreading; some tumefaction of eyelids. Temp., 101° 3.

6th.—Much œdema of the lids. The corneal ulcer is extending. Temp., 99° 5.

7th.—Mr. Power, Ophthalmic Surgeon, saw the patient, and reported as follows on the eye: "Ulcer of cornea circular, occupying the superior internal segment of the cornea; not very deep; base transparent, margin defined by a layer of puriform mucus; not much pain. A weak carbolised oil to be applied, and the cornea protected by a watch-glass."

The general condition of the patient is not satisfactory. Temp. normal.

9th.—Condition improved. His last two nights have been good. Corneal ulcers extending.

11th.—œdema of eyelids unchanged. Lymphatic glands at the right angle of the jaw much enlarged and tender. Temp. rose again to 104 in the evening.

12th.—The ulcer of the cornea now appears to implicate the whole of that structure. The wound is doing well. It is now healed.

The patient was removed to the ophthalmic ward, when abscission was performed by Mr. Vernon. He now gets up and goes out.

Translations.

ON PARACENTESIS THORACIS BY ASPIRATION IN ACUTE PLEURISY.

Par Dr. GEORGES DIEULAFOY,

Professeur Agrégé à la Faculté de Médecine de Paris; Médecin des Hôpitaux; Lauréat de l'Institut (prix Montyon).

Translated by C. A. OWENS, M.D., L.R.C.P. Ed.,
L.R.C.S.I., &c.

(Continued from page 73.)

CHAPTER IV.

Method of performing Paracentesis Thoracis by Aspiration in Acute Pleurisy.

AFTER having considered the indications for puncture of the chest in acute pleurisy, and discussed the objections which have been raised against it, I now come to the operation of paracentesis thoracis by aspiration. Up to the year 1869 there was one mode of procedure: it was that bequeathed to us by my respected master Trousseau. He punctured in the 6th or 7th intercostal space counting from above downwards, about 1½ or 2 inches from the external border of the great pectoral muscle, that is in the axillary region. He first made a small incision in the skin to facilitate the entry of the trocar, then, at one stroke, he pierced the chest wall by means of Reybard's trocar. This trocar was fitted with a valve of gold-beaters' skin to prevent the entrance of air into the chest on inspiration. The fluid escaped from the chest at first by jerks and then by dribbling, and in the course of the operation the patient was generally seized with a fit of painful coughing; sometimes "violent, unyielding, and severe," which Trousseau considered useful to favour the flow of the fluid externally, and which, in certain patients, was prolonged through a portion of the day. It must be added that not seldom towards the end of the operation the fluid was found to be coloured red by its mixture with blood. Thus performed paracentesis of the chest without being a very difficult or painful operation, required nevertheless some ability on the part of the surgeon and some resignation on the part of the patient; it was, moreover reserved for urgent cases and was practised by a comparatively small number of medical men.

In 1869 when I applied the principle of aspiration to the treatment of morbid fluids, effusions of the pleura were the first to benefit by it; there was no pain; the trocar, &c., and primary incision were replaced by the prick of a needle which was so insignificant that when the operation was finished there remained not a vestige of it, and the fluid instead of being forced out in jerks during very painful fits of coughing, passed out, almost without the patient's knowledge, from the thoracic cavity into a receptacle in which a vacuum had been prepared. Thus simplified paracentesis became numbered among the resources of the most timid and most inexperienced practitioners; it became the easiest of all operations; and I ought to add that in my wards, there is no student, however little advanced in his studies, who does not perform it under my guidance. But, bear in mind, the extreme simplicity of the operation does not preclude the necessity for observing certain rules which must not be departed from, and possibly it is because they have not been sufficiently followed that accidents have arisen which should have been prevented. How, and according to what principles should the operation of paracentesis be performed on a patient with pleurisy?

The patient should be seated on his bed, with his arms crossed on his chest, or better stretched out before him. The operator first marks on the skin in ink or pencil the spot on which the puncture should be made, and I recommend the 8th intercostal space, in a line dropped from the inferior angle of the scapula. It may be seen that the spot chosen is placed lower and further back than in the old operation; I find it offers the advantage of reaching the fluid in a more dependent position, and also of avoiding the risk of encountering the lung which floats much above this level. The operation should be

done with No. 2 needle, and not with a needle or trocar of larger diameter. Its permeability is to be ascertained by means of a silver wire and a jet of water; then the needle cleaned and oiled is attached to the aspirator by means of an india-rubber tube—the necessary vacuum is made in the apparatus, and the operator proceeds to make the puncture. To do this, the index finger of the left hand is placed in the intercostal space decided upon, so as to press the upper rib with its lower edge; thus making use of the nail or end of the left index finger as a conductor, and holding the aspirator needle in the right hand like a pen, it is made to penetrate the intercostal space and pleura at one sure stroke. Therefore it is the left index finger upon which devolves the most delicate part of the operation, since it is this which defines the intercostal space and which also forms a conductor for the needle. When introduced into the tissues the needle is thrust in for about an inch in depth, the corresponding tap of the aspirator is opened, and the fluid having passed through the crystal index appears in the apparatus. If the fluid does not come, the needle has not been put in far enough, and it may be pushed in without fear, because the vacuum will show the moment the fluid is reached, with certainty. At the moment the puncture is made the needle is introduced perpendicularly to the wall of the thorax, but as it is thrust in its point should be inclined upwards and outwards: upwards because of the upward curvature of the convexity of the diaphragm; and outwards because the lung is pressed inwards. When the aspirator is full it is emptied by shutting and opening the corresponding taps, and this pause of a few seconds is beneficial to the lung, which for an instant suspends its movement of expansion, and is thus not induced to unfold itself too rapidly. This manoeuvre is repeated six or eight times according to the size of the aspirator, and when about a pint and a half of fluid has been withdrawn, which is easily known, as the aspirator is graduated, the flow must be stopped. When the operation is finished and the needle withdrawn it is hard to find any traces of the prick in the skin, and no dressing, not even a piece of diachylon, is required.

With the rack-aspirator holding $4\frac{1}{2}$ ounces a pint and a half of fluid may be removed without hurry in twelve minutes; and when the operation is performed methodically, the patient should not have the slightest cough, nor experience the least pain, nor any uneasiness whatever. If the pleurisy is complicated, if the field of aeration is narrowed by cardiac or pulmonary lesions, if pleural adhesions are supposed to exist, if *above all* during the operation the patient experiences a sensation of tearing or of *pain within the chest*, it is preferable, seeing we can operate again to-morrow, to suspend the flow even if only 10 or 12 oz. have been withdrawn. But these precautions, which cannot be too closely observed in complicated pleurisy, constitute the exception in the simple form. The operation is hardly finished before the patient begins to feel benefit from it; respiration becomes easier and deeper, and the signs on percussion and auscultation are modified. What is to be done now, and what steps are to be taken with regard to fluid left in the chest? If the effusion is very large, if it exceeds 4 or 5 pints, the operation should be repeated the next day, or the next day but one, another pint and a half being withdrawn, and so on till the whole of the effusion is removed. But if the quantity of fluid as frequently happens does not amount at first to more than $2\frac{1}{2}$ or 3 pints, what is to be done? Is it necessary to repeat the operation for a few ounces of fluid? To this I reply that it has frequently occurred to me, in dealing with effusions estimated at about 2 or $2\frac{1}{2}$ pints, to remove only a pint and a half or so, and to leave the remainder, and this proceeding has not prevented a rapid cure taking place. I consider therefore that another operation is only indicated when the fluid left in the pleura reaches half a pint; below that figure we must refrain.

(To be continued.)

The annual rates of mortality last week in the principal large towns of the United Kingdom were—Bradford 14, Oldham 15, Edinburgh 15, Brighton 16, Bristol 17, Norwich 17, Salford 17, Plymouth 18, Birmingham 18, Wolverhampton 18, Sheffield 19, Portsmouth 19, Manchester 22, Hull 22, Sunderland 22, Glasgow 22, Liverpool 22, Dublin 24, Newcastle-on-Tyne 25, Leicester 25, Leeds 25, London 26, and Nottingham 29 per 1,000 of the population.

Special.

THE INTERNATIONAL MEDICAL CONGRESS.

The following is the daily programme, complete up to our going to press:—

Tuesday, Aug. 2nd.

- 10 a.m. to 6 p.m. : Registration of Members.
- 3 to 6 p.m. : Informal Reception at the College of Physicians.
- 9.30 p.m. : Conversazione given by President of Odontological Society to the Members of the Odontological Section.

Wednesday, Aug. 3rd.

- 11 a.m. : General meeting at St. James's Hall; Chairman Sir William Jenner. The Prince of Wales will declare the Congress open. Inaugural Address by Sir James Paget.
- 3 p.m. : Meeting of the Sections.
- 4 to 7 p.m. : Musical Promenade in Royal Botanic Society's Gardens.
- 4.30 p.m. : General Meeting. Address by Professor Virchow.
- 9.30 p.m. : Conversazione at South Kensington Museum.

Thursday, Aug. 4th.

- 10 a.m. to 1 p.m. : Meetings of Sections.
- 1.30 p.m. : Visits to Hospitals.
- Demonstration of Natural History Collection at South Kensington by Professor Owen.
- 2 p.m. : Meeting of Sections.
- 4 p.m. : General Meeting. Reading of the late Professor Raynaud's Address by his friend Dr. Féréol.
- 6.30 p.m. : Banquet given by the Lord Mayor at the Mansion House.

Friday, Aug. 5th.

- 10 a.m. to 1 p.m. : Meetings of Sections.
- 12.45 p.m. : Visit to Mr. Penn's Works at Greenwich.
- 1.30 p.m. : Visits to Hospitals.
- Demonstration of Natural History Collection at South Kensington by Professor Owen.
- 2 p.m. : Meetings of Sections.
- 4 p.m. : General Meeting. Address by Dr. Billings.
- 8 p.m. : Conversazione at the Guildhall.
- Soirée at the Royal College of Surgeons, free to members of the Congress.

Saturday, Aug. 6th.

- 10 a.m. to 1 p.m. : Meeting of Sections.
- 12.15 p.m. : Excursion to Croydon Sewage Farm.
- 1.45 p.m. : Excursion to Folkestone—Unveiling of Harvey Memorial Statue.
- 2 p.m. : Excursion to Hampton Court, and Garden Party at Normansfield, given by Dr. Langdon Down.
- 4 to 7 p.m. : Reception at Kew Gardens by Sir J. D. Hooker. Garden Party at Hampstead, Given by Mr. and Mrs. Spencer Walls. Garden Party at Wimbledon, Given by Mr. and Mrs. Saunders.
- 6.30 p.m. : Dinner at Richmond, given by the United Hospitals Club.
- Reception by the Foreign Secretary to the Foreign Members of the Congress.

Sunday, Aug. 7th.

- 10 a.m. : Full Choral Service and Sermon in Westminster Abbey.
- 3.15 p.m. : Full Choral Service, and Sermon by Canon Liddon, in St. Paul's Cathedral.
- 1.30 p.m. : Excursion to Boxhill, Luncheon at the Residence of Sir Trevor Lawrence.
- The Gardens of the Royal Botanic Society, Zoological Society, and at Kew and Hampton Court, will be open to Members of the Congress.

Monday, Aug. 8th.

- 10 a.m. to 1 p.m. : Meetings of the Sections.
- 11 a.m. : Visit to the Docks.
- 2 p.m. : Meetings of Sections.
- 4 p.m. : General Meeting. Address by Professor Huxley.
- 6.30 p.m. : Dinner given by the Master and Wardens of the Society of Apothecaries.
- 9.30 p.m. : Conversazione given by the Royal College of Surgeons.

Tuesday, Aug. 9th.

10 a.m. to 1 p.m. : Meetings of Sections.

2 p.m. : General Meeting.

4 p.m. : Visit to Crystal Palace; informal Dinner, and Display of Fountains and Fireworks, &c.

The General Meetings will all be held in St. James's Hall; the Sections meet in the University of London, Burlington House, the Royal Institution, the Asiatic Society's Rooms, and the Royal School of Mines; the various Offices of the Congress are in the Rooms of the Royal College of Physicians, Pall Mall East. Members will be required to show their tickets at each meeting.

FRANCE.

[FROM OUR SPECIAL CORRESPONDENT.]

URETHRAL FISTULA.—At a recent meeting of the Société de Chirurgie M. Poncet related the case of a man who came to him with a lesion of the penis producing a urethral fistula. This individual, suffering from hypospadias, introduced into his urethra certain foreign bodies, amongst others a gold watch-chain, which caused considerable swelling of the prepuce and a fistula. M. Poncet was able to close the fistula by paring the edges and introducing deep and superficial sutures. This treatment succeeded admirably, but the patient on leaving the hospital deliberately tore open the cicatrix.

HERMAPHRODISM.—Another member reported a very curious case of hermaphroditism. A man, born of healthy parents, was registered in his district as belonging to the female sex. At the age of thirteen menstruation commenced, and at the same time the breasts were seen to develop themselves, and "she" was observed to have inclinations common to her sex at that period. She got married, but copulation was never able to take place. Her husband died in 1871. Since that time her ideas changed; she had several mistresses with whom coit was regularly accomplished. She shaved every second day; the face is not very masculine, yet the body in its outline approached nearer that of the male sex. The penis is no larger than that of a child twelve years old. There is hypospadias. In each labium can be felt a rudimentary testicle. There is no vagina nor uterus. This hermaphrodite belongs to the class of the imperfect bi-sexual hermaphrodites of Geoffrey St. Hilaire. M. Pozzi believed it was more the case of a man with hypospadias than a true hermaphrodite. The infundibulum between the labia was due to the attempts at copulation. The feminine voice and the voluminous breasts were not astonishing as the same are observed in eunuchs. He believed that hermaphroditism is getting very rare. For the last twenty years not one true case was demonstrated. M. Pozzi was sustained in his views by all the other members with the exception of M. Tilleux, who thought that hermaphrodites really existed.

BROMIDE OF POTASSIUM IN EPILEPSY.—In a classical book styled "Nouveaux Eléments de Matière Médicale et de Thérapeutique," the authors declare that in the treatment of epilepsy in adults drachm doses of bromide of potassium should be given daily, and gradually increased to two or three or even six drachms in the twenty-four hours. This opinion, constituting a grave error and fraught with danger, induced M. Ferraud, who has been a close observer of the results obtained at the Salpêtrière Hospital by M. Sequard de Saulle, devoted his *thèse* to the treatment of this disease as followed by this physician. In comparing the years 1879 and 1880 M. Ferraud divides the epileptics into three categories; the first comprises those patients who for some considerable time have had no more attacks; the second in which the attacks have sensibly diminished by half or more; and the third group comprises those who have been only slightly relieved. Of seventy-nine patients twelve belong to the first group, fifty-one to the second, and sixteen to the last. M. de Saulle commences with thirty or forty grains, at the most, of bromide of potassium in the twenty-four hours, and after the first fortnight according to the case increases it by eight grains. At the end of the second fortnight another slight increase was made so that at the end of from three to six months the daily dose of from sixty to ninety grains for women and

eighty to one-hundred-and-twenty grains for men was attained. These doses should if possible not be exceeded. Under any pretext the salt should not be increased too rapidly for fear of inducing bromism. As soon as a patient remained one year without an attack the medicine was given every second day during the first fortnight of each month and every day for the second. At the end of two years if the patient still remained free from attack the bromide was given but every fourth day during the first fortnight of each month and every day during the second, and so on. M. de Saulle believes that the reason that medical men are so much discouraged in the treatment of this disease lies in the fact that, as soon as a slight amelioration is observed the dose is diminished progressively. He has at present four epileptics who for more than twelve years have not had one attack yet they have not entirely suspended treatment. Bromide of potassium has been accused of weakening the memory, but this effect is only observed where the daily dose exceeds three or four drachms. In any case M. de Saulle when he reaches the dose of ninety grains orders two or three cups of strong coffee to be taken in the day as a preventive. He has thus never seen any evil results from the salt.

The Mineral Waters of Europe.

THE "MEDICAL PRESS"

ANALYTICAL REPORTS ON THE PRINCIPAL BOTTLED WATERS.

By CHARLES C. R. TICHBORNE, LL.D., F.C.S., F.I.C.

President of the Pharmaceutical Society of Ireland, Lecturer on Chemistry, Carmichael College of Medicine, &c.

WITH

NOTES ON THEIR THERAPEUTICAL USES.

Lecturer on Materia Medica and Therapeutics at the London Hospital, Physician to the Hospital for Diseases of the Throat, &c.

(Continued from page 74.)

BIRRESBORN.

THIS spring, which is used as a table water, is situated in the Eifel Mountains, in Rheiniah Prussia. It was analysed in 1875 with great care by Fresenius, and we give his figures, calculated to grains per gallon :—

Bicarbonate of sodium	199.570
Bicarbonate of lithium	0.231
Carbonate of calcium	19.103
Carbonate of barium	} 0.010
Carbonate of strontium... ..	
Carbonate of magnesiium	76.501
Carbonate of iron	2.458
Carbonate of manganese	0.046
Biborate of sodium, trace	
Sulphate of potassium	3.646
Sulphate of sodium	9.514
Chloride of sodium	25.033
Bromide of sodium	0.025
Iodide of sodium	0.0003
Phosphate of sodium	0.015
Nitric acid, trace	
Phosphate of alumina, trace	
Silicic acid	1.717
Total solids	337.869
Free carbonic acid	

Skeleton Analysis of 10 oz. fluid (½ pint).

Solids.	Antacids.	Salines.	Purgatives.
21 grains.	18 grains.	1½ grains.	1 grain.

This is a table water of very marked alkaline character, and slightly purgative.

HARROGATE KISSINGEN.

Although this water is almost strong enough to be considered a medicinal water, we have inserted it here owing to two causes. It is based on the lines of a table-water, although rather concentrated (604 grains per gallon), and is also artificially aerated, to make it more palatable. We believe that this last is done at the suggestion of Prof. Attfield, who has lately examined this water. He reports as follows:—"After my experiments on the modes of keeping out the mischievous oxygen of the air, and of adding solvents of the chalybeate components of the Harrogate waters, I have no hesitation in recommending simple aëration of the waters by a due quantity of carbonic acid gas immediately they come from the spring, and, of course, immediately bottling. Aërated Harrogate waters would take immensely with the public."

This spring has been repeatedly analysed. In 1845, by West, in 1854, by Hofmann, in 1867, by Muspratt, and by Attfield in 1879. There has been very little change, as evidenced by these analyses, which were all performed by reliable men.

The total solids in the pure spring seem to have come back to the old figures of the original analyses performed in 1845, namely, about 875 grains, whilst they fluctuated to 908 and 991 in 1854 and 1867. It is interesting to remark in connection with this spring that excessive rainfalls do not, from the records, appear to influence the composition. It would, probably, be the case in most of the similar mineral springs which, in nine cases out of ten, come from considerable depths. If a water were influenced by such rainfalls, it would give indications of surface drainage. The water is fairly chalybeate, but still this chalybeate character seems to be steadily increasing, although we have not found quite as much iron present as given in Prof. Attfield's analysis. Thus the iron in 1854 was 1·34; in 1867, 1·79; and in 1879, 4·6.

It contains in the mild bottled form—

Chloride of sodium	465·63
Chloride of potassium	15·00
Chloride of magnesium	45·42
Sulphate of barium	0·35
Sulphide of sodium	trace
Carbonate of barium	1·46
Chloride of strontium	0·59
Chloride of calcium	61·18
Carbonate of calcium	6·09
Carbonate of iron	6·09
Silica	2·50
Lithium
Ammonia	0·10
Total	606·62

Skeleton analysis of 10 ounces fluid (½ a pint.)

Total Solids.	Salines.	Antacids.	Purgatives.	Iron.
38 gra.	34 gra.	1 gr.	3 gra.	½ gr.

The presence of sulphides, although very naturally to be expected, is here observed for the first time. The Harrogate Kissingen is a mild chalybeate water, possessing very little aperient properties; in fact, only what would be about sufficient to control the action of the iron. The Harrogate Kissingen is perfectly pure, gives only an alkaline reaction with phenol-phtalein after boiling some time, and even that is not permanent. It has no action upon diphenylamine or metaphenylene-diamine, proving the absence of nitrates, or nitritis. Nor does it contain any nitrogenous organic matter. It is artificially aerated by carbonic acid gas.

From the next analysis it will be seen that this spring bears a remarkable resemblance to the Bavarian Kissingen, and is a bitter water.

KISSINGEN (BAVARIA).

Rakoczy.

Chloride of sodium	407·543
Chloride of potassium	20·008
Chloride of magnesium	21·265
Chloride of lithium	1·401
Sulphate of magnesium	41·187
Sulphate of calcium	27·225
Carbonate of magnesium	1·192
Carbonate of iron (ferrous oxide)	2·210
Phosphate of calcium	·392
Silica	·903
Nitrate of sodium	·651
Bromide of sodium	·586
Carbonate of calcium	74·267
Total solids	599·64

Skeleton Analysis of 10 oz. fluid (½ pint).

Solids.	Salines.	Antacids.	Purgatives.	Iron.
37½ gra.	29 gra.	4 gra.	3½ gra.	14 gra.

In the principal foreign cities the rates of mortality according to the latest official weekly return, were in—Calcutta 17, Bombay 30, Madras 32; Paris 32; Brussels 27; Amsterdam 20, Rotterdam 23, The Hague 20; Copenhagen 23, Stockholm 19, Christiana 11; St. Petersburg 59; Berlin 37, Hamburg 22, Dresden 26, Breslau 44, Munich 32; Vienna 27; Prague 32; Buda-Pesth 35; Rome 29, Turin 25, Venice 18; Alexandria 30; New York 39, Brooklyn, 30, Philadelphia, 19, and Baltimore, 33 per 1,000 of the various populations.

We are asked to state that the Consumption Hospital, Brompton, will be open to-morrow (Thursday), at 2 p.m., to members of the International Medical Congress; and the committee of management and physicians will be present to receive visitors and conduct them over the new hospital, where there are 137 beds, and show the various new appliances for the treatment of chest diseases.

WELCOME.

It is with a feeling of the liveliest satisfaction that we address a hearty welcome to the distinguished visitors who will, for the next week, be our guests and companions. The sense of England's indebtedness to those very foreigners who are at this moment in our midst, of the benefits that we, in common with the whole world have derived from the achievements they have perfected, and of the inestimable value of the work they have accomplished, suffices to raise in us a more than usual warmth of feeling, and to cause us to regard the foreign members of the International Medical Congress as doubly our brothers and our friends. The fame of British hospitality has penetrated to every nook and corner of the world, and from almost every crevice of the globe have there come to our shore members of the profession of medicine, ready to accept what they full well know will be offered to them with eager hands and willing hearts. We trust, indeed, that the keenest recollection our friends from abroad will take away with them from us, may be the remembrance of the universal goodwill they have experienced; and that their first regret on departing may be heralded with a sigh that the pleasures they have enjoyed are past. We have on every hand, made far reach-

ing preparations for the comfort of our visitors. We have had in view their interest also, and a magnificent co-operation of many able hands and minds has resulted in arrangements whereby pleasure may be amply secured by such as will accept it, along with the labour that engages them. Let our guests then receive the offerings made to them in the generous spirit that has prompted them; and by availing themselves to the utmost of the invitations and opportunities showered on them, may they rest assured they will most fitly and amply repay the anxious endeavour to do them the honour they so richly deserve.

We cannot help but feel a not inconsiderable pride on the array of names that went to make the list of those who were present at to-day's opening ceremony; and we would have their owners be convinced that the representatives of English medicine are conscious of the dignity that is conferred on our great national centre of professional interests, by the presence in it of the men who have in America, and in Europe, striven hard in honourable rivalry with our own pioneers of progress. Indeed, the association together of leaders boasting different nationalities, leaders whose pursuit has the same aim, and who are actuated by the same ennobling motives, is no small part of the triumphs pointed by such a meeting as the Congress promises to be. We are glad that this is fallen to us to say; and we are more than happy in the consciousness that every individual who takes part in the proceedings of the meetings is alike certain with ourselves of the truth of these remarks.

We have, it almost seems to be forgotten, a national Association of medical men in the British Medical Association, the annual meetings of which are a periodical proof of the strength and reality of professional brotherhood. Among native practitioners this however could not be supposed to exert more than a local influence on the scientific progress of medicine; but that it has been an important influence results sufficiently testify. Similarly, it has been the case also with international works in other countries; and though we can occasionally judge how much is due to these limited combinations of workers, we are able to gauge its full value only when, as at present, we have in one united gathering, what are really the choice spirits of all the smaller, more circumscribed ones.

England welcomes and is proud to receive this great band of workers in a common cause; and every visitor to the Congress may be satisfied to know how it is the earnest wish of all, that for this week he will regard London as his home, and every Londoner as his friend.

REFORM OF MEDICAL EDUCATION IN IRELAND.

A PEACEFUL revolution in the educational prospects of the coming generation of the profession in Ireland—not the less thorough and comprehensive because it has been peaceful—has been completed by the Council of the Irish College of Surgeons in Ireland within the past week. The new scheme of education and examination to which we have frequently referred in these columns in the course of the past two years, has been at length finally

revised and adopted by the Council, and ordered to be promulgated as the future law of the College; and, inasmuch as a considerable majority of the medical students who obtain their education in Ireland pass through the portals of that Institution, we are justified in attaching the first importance to the reform which the new scheme embodies. The space at our disposal does not enable us to give the text of the future educational code of the College, but—for the better understanding of what has been decreed, and of the effect of it upon the Irish student of the future—it is necessary that we should sketch the chief principles of the scheme.

The Irish College of Surgeons will admit no future candidate to its license—who commences his studies after this date—unless he is over twenty-one years of age, nor will it recognise any certificate of medical study unless the student has passed his preliminary examination, and has registered himself as a student in the books of the Branch Medical Council. Heretofore, this latter proceeding has been discouraged by certain teachers and school registrars, and neglected by the student, and that neglect has been connived at by the Branch Medical Council, so that, as far as Ireland is concerned, the Medical Student's Register had come to be altogether unreliable, in consequence of its omitting from its columns a large proportion of the Irish student class. The teachers discouraged registration because they did not wish to be tied down to any fixed time for the entry of students for lectures, and it is notorious that certain school registrars did not hesitate to accept entries of students in January, February, or March for courses of lectures which commenced in the previous November, which were certainly never attended, and probably never paid for. Such a proceeding as this cannot be characterised in any other terms than as a disgraceful and dishonest evasion, and we repeat that its frequent occurrence in certain Irish schools was notorious, and yet, though its prevalence must have been well known to the Irish members of the General Medical Council, that body looked on and took no steps whatever to enforce either antecedent preliminary examination, or student registration, or adult age, or four actual years of medical study, all of which were "recommended" by them as requirements to be strictly enforced.

To these four years of study the new scheme of the Irish College of Surgeons now, for the first time, gives reality. Heretofore, the student entering his name for the first time in the November of any year might (and often did) obtain his final qualification in thirty-three months (or two years and nine months) afterwards. Henceforth he will not be admitted to the final examination until forty-five months have expired from his registration as a student.

The regulations to which we have as yet referred are all in the direction of increased but necessary stringency, and, for the first time, these requirements, which have existed in name only for many years, will be strictly enforced. There is really, however, no increased incubus placed upon the average student thereby, because, notwithstanding the laxity which has prevailed, it was comparatively rare for a student to qualify before he had attained his majority, or to complete his education before

his fourth year; and, therefore, these regulations will really operate not against the student, but against the teacher, school registrar, or apprentice farmer who has hitherto profited by the non-enforcement of these rules.

For the student himself the new scheme is intended to be, and, we doubt not, will prove to be, an immense relief to the student, while it will afford a powerful incentive to him to work steadily and educate himself, without any one excessive effort, to be a good working practitioner. Heretofore, the whole of the student's labours and anxieties were concentrated in the last six months of his third year. Even the first, or preliminary "half" of his examination, could not be taken until his third winter had closed, and from the day he entered his name as a student until that period, he had neither necessity nor inducement to work. Thus during his first two years and a-half idleness and dissipation were, so to speak, thrust upon him, and during the last six months superhuman effort and consequent failure were the result. Now we have too high an opinion of the Irish medical student to believe that this sort of thing is desired by him. Like other items of humanity, he will work or he will idle, according as facility and temptation to either course is held out to him. Under the existing system it would be wonderful if there were not many students who learn little, fail ignominiously and repeatedly, and ultimately abandon the profession as a hopeless aspiration, having spent the best years of their life, and much of the hard-gotten earnings of their parents, in the attempt to achieve admission to it. In future in Ireland every student will be encouraged and compelled to distribute his studies evenly over his four years. He will commence, fresh from school, and presumably in diligent mood, with the study of preliminary scientific subjects, such as he can study without entering at a medical school, and without which his medical study must be unintelligible and laborious to him. Of these subjects he must show his knowledge by examination before he goes on to elementary studies in medicine and surgery, from which he will advance by successive steps through the full arena of his professional subjects to the final clinical and practical tests which will qualify him to treat disease. From each stage he must pass by examination before he can enter upon the next, but he will have in all cases two chances of doing so, and in exceptional cases a further supplemental examination if he deserves it. Examinations will be held in the July and October of each year, immediately after the termination of his year of study; if he be prevented going for the first, or fail to pass, he can offer himself for the second, and, if he can show any sufficient cause for not having presented himself for the second, he may still be allowed to "supplementalise" and pass in a special subsequent examination. Considering that at each of these examinations he will be tested not, as at present, in a large number of advanced subjects, but in a few to which his attention has been specially devoted during his past year, we fully believe that the student himself will appreciate the relief which the system affords him, and will be anxious to avail himself of its provisions.

We have endeavoured to point out how much of medico-educational reform may be hoped for from the new system which the Irish College of Surgeons has de-

creed. We look to it, however, to produce another equally important change at which it has not been specially aimed, but which will follow as a necessary consequence. The scheme, we rejoice to believe, is the death-blow of the nefarious credit fee and apprentice-farming systems which were begotten by, and have flourished under, the existing arrangements. Henceforth every year's certificate must be produced, and, *ergo*, must be paid for, before the student can go for the examination of that year. The lecturer will at the latest receive at the end of the course the fee which he ought to have been paid on the entry of the student for the lectures, and there will no longer exist the monetary inducements to put off to the end of the third year the payments of the entire course of study. This reform—with all its attendant benefits to the student, to the teacher, and to medical education is, of itself, a sufficient justification for the new scheme, and a cause for heartfelt thankfulness.

We rejoice that—at length—the Irish College of Surgeons has done itself justice and thoroughly purged the “evil humours” of Irish medical education. Too long it has waited upon the faltering “recommendations” of the General Medical Council, and too long hesitated to grapple with the many interests which have sustained and perpetuated the gross abuses of the dying Irish system, but, at length, the work has been accomplished, uncompromisingly, honestly, and thoroughly, and, in our satisfaction at the prospect of the future, we desire to forget that, credit-fees, apprentice-farming, sham certificates, cramming, and student victimisation have ever existed in Ireland.

THE MEDICAL DEFENCE ASSOCIATION AND MEDICAL REFORM.

A MEETING of this Association, held for the purpose of eliciting the views of the profession upon the subjects respecting which evidence will be required by the Royal Commission, was held in St. James's Hall on last Friday, Dr. B. W. Richardson, acting as President, and many influential and earnest medical reformers taking part in the proceedings. We are obliged to content ourselves with publishing the following resolutions, which were adopted, omitting unavoidably the substance of the very forcible arguments adduced by the various speakers in their favour:—

1. That in the opinion of this meeting entrance to the Profession of Medicine should only be by the holding of a State License.
2. That in the opinion of this meeting there should be one Examining Licensing Board for each division of the United Kingdom; that the examinations of each such Board should be of uniform standard, and should include as subjects for examination Medicine, Surgery, Obstetrics, and Hygiene.
3. That any person who shall have passed the examination of any of the three Examining Boards should be entitled to receive a State License fully qualifying him to practise all branches of medicine.
4. That no one shall be entitled to practise for gain unless he is registered, and that no one shall be entitled to be registered unless he possesses the State License.

5. That in the opinion of this meeting, no scheme of medical reform will be acceptable to the Medical Profession which does not provide for the direct representation of the Profession on the General Medical Council; and for a reduction in the number of the bodies represented in the General Medical Council which are interested pecuniarily in granting diplomas.

It will be observed that these resolutions are upon the same lines, and declare the same principles, as those which the profession through other representative organisations have expressed. A “State” license is spoken of as the only adequate qualification for practice, but from the second resolution it would seem that a conjoint or co-operative license is intended to be included in this term, and that uniformity of educational standard throughout the kingdom is considered to be absolutely indispensable. The fourth resolution goes to the extent of absolutely prohibiting unqualified practice for gain, and thus expresses the opinion of the Association that Parliament ought not to be satisfied with forbidding the use of medical titles by unqualified persons. Lastly, the Association declares firmly for direct representation, and for the disfranchisement of certain effete medical licensing bodies. These are, substantially, but not in detail, the propositions upon which all medical reformers have insisted. If viewed as an expression of opinion of the Association, they are judicious and necessary. If viewed as the working policy of the Association in Parliament they will, we fear, not be realised. The licensing bodies are powerful; the disinclination of the House of Commons to interfere with vested interests is great, and the prejudice in favour of free trade in medical practice is strong among its members. “State” examination and quack annihilation are, no doubt, excellent in principle, but at present, we fear, unattainable; and we think the Association will act wisely if, having firmly expressed its opinion, it contents itself with achieving a good, practicable, conjoint examination—a stringent prohibition of all use of medical titles—and a good measure of direct representation. Above all things, we counsel unanimity of purpose within the profession. If every doctrinarian insists in having his own little corner no battle will be won; and as all medical reformers are agreed in great principles, we earnestly advise that details, however important, shall not be allowed to stop the way.

Notes on Current Topics.

The War Office Gazette.

FROM a medical point of view the great military *Gazette* of last week presents several points of importance. One of these is the very large number of officers compulsorily retired, the reduction thus occasioned in the very highest ranks being actual, as regards effectives; as regards all others not so, but rather that men in every respect physically fit for the performance of duties towards which their whole education, training, and experience have been directed, should be thrown into idleness with incompetent means, in order that younger and less ex-

perienced men should be promoted to, and paid for doing, the work of their several ranks. It is something new to learn that, as a rule, gentlemen are physically unfit for active life at forty, forty-two, fifty, or fifty-five years of age, as it would appear that regimental officers are considered to be. Look at professional men, merchants, and country gentlemen in England; see many such men in the hunting field, on the highland hills, or among the glaciers of Switzerland, and this view scarcely obtains support. Turn to the history of wars in India and elsewhere, but, best of all, turn to the results of actual experience, and these prove that the men who best withstand the fatigues and hardships of campaigns, whether as soldiers or as officers, are not the young, impulsive, full-blooded, but the older, more hardened, and more wary. In times of great sickness, too, and of epidemics, not only are the relatively young men more liable to become affected than the old, but in emergencies to be unequal to the occasion—in other words, to “lose their heads.” So on first arrival in the tropics. As with soldiers so with officers, sickness, inefficiency by medical reasons, and through indiscretions, occur for the most part among the young and less “seasoned” men.

There is no doubt whatever that not only in battle, and on field service generally, much mutual help has arisen from that feeling of *camaraderie* which in bygone times formed the strongest of all bonds between the several ranks composing a regiment. In the *Gazette* we look in vain for the entity once named and numbered as a regiment; and we wonder how can a sentiment depending upon that entity exist when the thing itself in which it is developed has ceased to be.

The Indian Medical Service.

THE Indian Medical Service Defence Committee have lately circulated a long letter addressed to the Secretary of State for India, pointing out where they consider that, in a recent dispatch from the Viceroy in Council, they have been misunderstood, and their “accuracy most unjustly impugned.” The Committee admit that in almost every instance their grievances, as expressed in previous communications, have been practically acknowledged by measures being taken for their removal, but they are still sore at the repudiation of their inferences that the Indian Medical Service will in future be practically subordinated to the Army Medical Department. They quote certain facts in support of this, the most telling being that, out of seven principal medical officers in the second Afghan campaign, only one was an Indian officer, a proportion certainly not in accordance with the respective strength of the two services. It appears, too, that the names of the Indian medical officers mentioned in dispatches were originally suppressed, it is said, by an oversight, and that out of seven C.B.’s the Army Medical Department monopolised six.

The inequality of pay between the two services, and the effect on promotion by the suppression of certain administrative appointments, are also insisted on. It is satisfactory, however, to learn that while some further modifications on these points are prayed for, the opposition with which the Indian Medical Service was threatened by the teaching and examining bodies is now

withdrawn. It is admitted that the Civil Branch has been undoubtedly improved, although, according to the belief of the Committee, the Military Branch has been seriously depreciated. The latter was to some extent inevitable in amalgamating the two services, and so doing away with a dual administration in each of the three Presidencies.

But in their representation the Committee scarcely dwell sufficiently, we think, upon the comparative comfort of a career in India and that in the Army Medical Department, involving rapid changes from country to country; from bad to worse, and to the intense unpleasantness of duty at home under the present order of things. As for the civil duties, the sooner a local service becomes united the better.

No Accounting for Taste.

IN the interesting and instructive paper on “Calculus,” which Dr. Angus MacDonald contributes to our columns, he gives an analysis of the cases of introduction of foreign bodies into the urethra which were collected by M. Donné and published in the *Moniteur des Hopitaux*. He adds to the account of a woman who had introduced the handle of a stiletto into her bladder, the particulars of 391 other cases. An odd list it makes in all conscience. It includes 78 portions of catheters and lithotripsy instruments, 82 needles, pins, or tags, 6 bone or ivory needles, 6 ear-picks, 3 ivory whistles, 1 ivory spindle, 1 ivory stiletto handle, 15 leaden balls, 3 small keys, and 8 metallic fragments of various kinds, 12 bones or splinters of bone, 10 pieces of pebble or china, 6 pen holders, 15 needle cases, 10 pieces of tobacco pipes and 4 portions of glass tubing, besides other curious structures that we need not stay to mention. Of course, the catheters and lithotripsy instruments would find their way into the bladder by accident, but the greater portion of the others must have been intentionally introduced under depraved sexual excitement, or for some other foolish reason. It must be observed that Donné’s cases refer to both sexes.

“Pass and Pluck” at the College of Surgeons.

THE vicious system of publishing annual returns of the numbers of candidates from the various schools of medicine, passed and plucked by the Examiners of the Royal College of Surgeons of England, has been followed in the present year, and the result has just been officially announced. Real friends of medical reform had hoped that this utterly useless proceeding might have been allowed to decline into disuse, but in vain. That the whole arrangement is an utter farce but few venture now to deny, the more especially since absolutely no gain has resulted from it so far as the progress of education is concerned. An amusing proof of the nonsensical character of the returns is afforded in the fact, that the two centres which occupy admittedly the highest position as teaching institutions, are among those placed, by the vagaries of the College Examiners, in the lowest place on the list. It is almost time that the warnings more than once repeated by eminent teachers of medicine and surgery, to the effect that the College of Surgeons should reflect on the injury it is doing to the cause of medical education in this country, should be heeded, and the consequences

be delayed that are the certain outcome of the policy that is being pursued. For most that is bad in connection with the teaching of students here, the College of Surgeons is certainly to be blamed, and it would be of the utmost benefit to scientific medicine if the pernicious influence it exerts could be effectually checked.

The President of the United States.

THE wound which the would-be assassin of President Garfield inflicted on his illustrious victim has not yet been so far advanced on recovery as to remove the doubt, felt from the outset, that there was the gravest danger to be apprehended from it. The intense sympathy universally experienced with the sufferer has naturally created a general desire to believe the best; and even the surgeons in charge of the case would seem to have shared this feeling, if we may judge from the very meagre accounts afforded by them of their patient's progress. The nature of the injury, however, is such as to prevent any reliable prognosis in regard to it. The bullet fired at the President still remains in his body, and in such a position that it can hardly fail to be an excitant of inflammation so long as it occupies its present site. That this recurrence of inflammatory attacks is to be anticipated, has been already shown by the experience of the past ten days; and with the existence of such a cause of disturbance, allied very possibly with other foreign bodies, such as shreds of clothing, there must continue a risk that the natural consequence of suppressed suppuration, pyæmia, will at some time arise. Against this gloomy view, we have the extraordinary constitution of the patient, and the recognised skill of his attendants, to combat the influence of the disease; and with a fervent wish that ultimate success may attend the efforts made in his behalf, we can do no more than anxiously await the evidence that a favourable turn has been taken; this being probably to be looked for either with the actual removal of the embedded bullet, or its effectual encapsulation within the body.

Mesmeric Hypnotism.

MM. BOURNEVILLE and REGNARD have investigated this phenomenon in the Salpêtrière Hospital, and have shown that the so-called mesmeric sleep can be produced by gazing fixedly on almost any object, particularly in young impressionable females. They relate curious instances of the power so acquired over patients; and we are glad to see a subject up to this time abandoned to charlatans now scientifically investigated. The whole thing appears to us to be a form of hysteria—male or female; but it is at present the subject of a great sensational trial going on in the French metropolis, in which a French lady of very high rank is endeavouring to annul the marriage of her daughter with the son of Musurus Bey, the well-known Turkish ambassador in London. The young lady corresponded in the most affectionate terms with Musurus, junior, who induced her to go to London and marry him before a registrar. The mother states that she was under mesmeric influence throughout the whole affair. M. Charcot is engaged as an expert to investigate and give evidence in the case.

Increase of Poor Law Medical Work in Ireland.

It appears from the report of the Irish Local Government Board just issued, that during the year 1881 there has been in Ulster an increase of 9,627 cases prescribed for at the dispensaries, and an increase of 1,813 of those attended at their own houses.

In Munster there has been an increase of 8,847 cases prescribed for at the dispensaries, and of 5,736 of those attended at their own houses.

In Leinster there has been an increase of 2,241 cases prescribed for at the dispensaries, but a decrease of 2,373 of those attended at their own houses.

In Connaught there has been an increase of 7,198 cases prescribed for at the dispensaries, and an increase of 4,066 of those attended at their own houses.

The totals show a net increase of 37,155 cases for all Ireland, including both classes, as compared with previous years.

Papaya and Papaina.

DR. E. BOUCHUT on these medicines reports that he injected a solution three times into an adenoma of the neck, into one point and into many points according to the size of the tumour. At the end of two hours the pain was very great and attended with a violent fever. After three days the ganglia softened and were converted into abscesses, which may be opened with a bistoury. In three days more the abscess healed.

In three cases of cancer of the breast and in one of the inguinal ganglia, after castration in the hospital of St. Louis, the injections of papaina were efficacious.

M. Bouchut, in further experiments with papaina, finds that it is a tæniifuge, for after administration to a child, segments of tapeworm, 25 c.m. long, and in a partially digested state, were voided. In the Mauritius it has long been known as a remedy for round worm, and it seems probable that this new remedy may have a future before it as an anthelmintic.

Royal College of Physicians, London.

AT an ordinary meeting of the Royal College of Physicians of London held on Thursday last, July 28th, Dr. Pitman read a communication from the Medical Act Amendment Commission, in which the opinion of the college was requested as to

1. Whether it is desirable to make any alteration in the present licensing system; and, if so, to state of what nature such alteration should be.

2. Whether the present constitution of the General Medical Council is satisfactory.

Dr. Pitman then submitted, for the consideration of the College, a letter which he had drafted in answer to this communication. This letter stated in effect, in answer to the first question, that the College adhered to the well-known conjoint scheme; and to the second, that the College had no opinion to offer. Dr. Pitman explained his answer to the second question by the probability that the opinions of the Fellows on this subject would be so numerous as to be practically useless.—Drs. Quain and Priestley supported the adoption of this letter, with the amendment that the words "does not desire to offer an opinion" should stand,

instead of the original wording.—Dr. West considered that the opinion of the majority should be taken on this important question.—Dr. Wilson Fox questioned the necessity of the College adhering to the conjoint scheme.—Sir Wm. Jenner pointed out that there was no alternative between the conjoint scheme and a Government Board, independent of the Corporations.—Dr. Barnes proposed, and Dr. Shepherd seconded, that the words "is not prepared" should be substituted for "does not desire," in the answer to the second question. Dr. Barnes argued that it was to be regretted if the College should seem to preclude all discussion of a matter which was of so great interest and importance to the public and to the profession.—Dr. Barnes's amendment was lost by 22 to 18; and Dr. Pitman's letter, with Dr. Quain's amendment, was then adopted.

Drs. Sieveking, Greenhow, Andrew Clark, and Beale were elected censors; Dr. F. J. Farre, treasurer; Dr. Pitman, registrar; and Dr. Munk, Harveian librarian; and the examiners in the various departments were appointed.

A Monotony of Diet as a Cause of Fever Epidemic.

In the lately issued report of the Irish Local Government Board it is stated that the attention of the Board was drawn by inspectors to the fact that in districts where the fever was prevalent one of the predisposing or exciting causes had been the monotony of diet; the staple article of food appeared to be Indian meal made into stirabout, always cooked in the same way, while few were able to get flour, bread, or potatoes; the power of resisting contagion was said to have been lowered by this circumstance, and as the germs were carried from house to house the disease was easily propagated. The Board therefore, addressed a circular to the boards of guardians recommending them, when out-door relief was given, to vary the food as much as possible, substituting oatmeal for Indian meal on some days of the week, bread on other days, and to make such other change in the daily food as might be practicable.

A New Test of Intelligence.

DR. DELAUNAY, of Paris, says that, to ascertain the qualities of a cook, it is sufficient to give her a plate to clean, or sauce to make, and watch how she moves her hand in either act. If she move it from left to right, or in the direction of the hands of a watch, you may trust her; if the other way, she is certain to be stupid and incapable. Similarly the intelligence of people may be gauged by asking them to make a circle on paper with a pencil, and noting in which direction the hand moved. The good students, in a mathematical class, draw circles from left to right. The inferiority of the softer sex (as well as of male dunces) is shown by their drawing from right to left; asylum patients and children do the same. In a word, *centrifugal* movements are a characteristic of intelligence and higher development; *centripetal* are a mark of incomplete evolution. A person, as his faculties are developed may come to draw circles the opposite way to what he did in youth. Delaunay has some further extraordinary conclusions as to the relative positions of races in the scale of development from the way they wind their watches and make their screws.

The Royal Commission on Medical Reform.

THE Commission met for the last time until after the recess on Friday, Saturday, and Monday last. The witnesses on the list for hearing were Mr. Charles Macnamara, of the Westminster Hospital, one of the chief members of the Medical Reform Committee of the British Medical Association; Dr. Pocock, of Notting Hill, who is heard on behalf of the foreign graduates; Professor Gairdner, as spokesman for Glasgow University; Mr. Thomas Cooke, of the well-known School of Anatomy in London; and Dr. Billings, of New York, who, it was anticipated, was able to afford the Commission valuable evidence as to American diplomas. The taking of evidence will be resumed in October, in order that a report may be ready before Parliament meets. We do not believe that any definite conclusion has been arrived at upon either principle or detail of that report, but there is, we have reason to think, a strong leaning in the minds of certain of the most influential members in favour of establishing a "Staats Examen," either by the co-operation of licensing bodies or by Government intervention, leaving the licensing bodies to give their higher degrees on what terms they please, but restraining them from giving any qualification to practise.

The Cost of Irish Pauperism.

In the year ending March 31st, 1881, there has been an increase of £37,774 in "in-maintenance and clothing," an increase of £36,311 in "out-door relief," an increase of £361 in cost of "deaf, dumb, and blind," an increase of £1,203 in "salaries and rations of officers," and an increase of £6,363, in all other expenses, making a total increase of £82,012. The increase in the total number relieved has been 158,622.

WE learn that sporadic cases of yellow fever have occurred in Demerara, and that an increase of the disease is apprehended by the medical officers in charge.

ON reference to the weekly official returns of the rates of mortality in foreign cities, it would seem that St. Petersburg, Breslau, New York, Naples and Berlin show much the highest death-rates at the present time, whilst Prague, Paris, and Baltimore are close upon their heels.

THE President of the Local Government Board, Mr. Dodson, has arranged to receive a deputation from the medical officers of health, the Social Science Association, and the Parliamentary Bills Committee of the British Medical Association, on the subject of the tenure of office of medical officers of health, on Thursday next, at 2.30, at the offices of the Local Government Board.

WE are asked by the Secretary-General to announce that there will be a clinical morning for rare cases of skin diseases in the Skin section of the International Medical Congress on Saturday, August 6th, commencing at 10 a.m. Gentlemen are invited to communicate with Dr. Thin, 22 Queen Anne Street, W., as soon as possible, their intention to demonstrate rare cases of skin disease.

MEDICAL PRESS AND CIRCULAR SPECIAL REPORT

ON THE
INTERNATIONAL MEDICAL & SANITARY
EXHIBITION,
SOUTH KENSINGTON.

Continued from page 78.)

PHARMACEUTICAL PREPARATIONS, DRUGS, &c.

BURROUGHS, WELLCOME, AND Co., No. 2 Western Gallery and No. 147 West Quadrant.—This is one of the most extensive and interesting collections in the whole Exhibition, it consists of many new and practical improvements in medicine and pharmacy.

This firm represents the principal drug houses of America, and, in introducing their "latest improvements in pharmacy" to the profession, have adopted a line of practice not hitherto followed by English firms—viz., that of presenting examples of new preparations to practitioners who desire to test them, and by not advertising in any but medical and pharmaceutical journals. This latter will commend itself, as members of the profession are thus assured that their expressions of approval of any preparation will not be published in the lay press. The exhibits of this firm comprise—

Hazeline, the active principle of Witch Hazel (*Hamelis Virginica*), is a valuable astringent remedy, wonderfully efficacious in checking internal or external hæmorrhages, and for allaying inflammation; it is particularly valuable in the treatment of bleeding-piles, and, as a surgical dressing, it deserves attention.

The *Burroughs' Beef and Iron Wine* is a very valuable nourishing tonic, especially desirable for delicate patients who cannot retain ordinary foods; its flavour has been greatly improved and is very agreeable.

The *Burroughs Inhaler* is an ingenious and convenient device for inhaling chloride of ammonium fumes; by its use the chloride of ammonium is brought in more intimate contact with the mucous surfaces of the passages of the nose and throat than by any other form of inhaler.

The following houses are also represented:—

JOHN WYETH AND BROS., Philadelphia.—*Wyeth's Compressed Hypodermic Tablets* are entirely new, and are now shown for the first time. Each little tablet contains as a vehicle quarter of a grain of sulphate of sodium, with morphia, atropia, and other alkaloids usually employed for hypodermic medication.

The use of sulph. soda is an advantage over other vehicles, as it promotes absorption without causing pain or irritation, and acts as a disintegrator, forming an almost instantaneous solution with three drops of water.

Wyeth's Compressed Tablets, Chlorate of Potash, Muriate of Ammonia, and various other drugs for throat affections. They are vastly superior to the ordinary sugar or paste lozenges, and on account of their very small size may be easily retained beneath the tongue while using the voice.

Dyalised Iron.—Wyeth's Iron has an established reputation, and is a thoroughly reliable preparation; it has steadily gained favour with the profession.

MCKESSON AND ROBBINS, New York. *Capsuled Ovoid Pills*.—The ovoid shape is a positive advantage over the round form, as patients, even small children, take them easily after finding it impossible to swallow round pills, even if coated. These pills are completely and hermetically sealed by the continuous covering of gelatine, they do not have pin holes or other openings penetrating the covering as we have noticed in some other pills. They are quickly soluble, and certainly the most important improvement yet made in the manufacture of pills.

KEPLER EXTRACT OF MALT Co., London.—The Kepler Malt is very delicious to the taste, and has been found by analysis to be exceedingly rich in diastase, and consequently is a valuable digestive agent. The Kepler Malt, combined with cod-liver oil, is the most palatable and easily digested of any form we have yet seen for administering cod-liver oil.

LAWTON AND Co., Boston, U.S.A.—*Lawton's Absorbent Cotton* has been pronounced by some of our most eminent surgeons the very best absorbent for taking up discharges; it is very fine and soft, and acts instantly.

FELLOWES AND Co., New York.—*Comp. Syrup of Hypophosphites* is a decided nerve tonic.

ALFRED BISHOP, London.—*Bishop's Granular Effervescent Citrate of Caffeine* is gaining favour as a remedy for headache.

SYMES AND Co., Liverpool.—*Lac Bismuthi and Lac Bismuthi et Cerii*.—A desirable form for administering these valuable remedies.

MURRAY AND LANMARE, New York. *M. and L.'s Florida Water*.—This hygienic toilet water possesses decided antiseptic properties. When sprayed through the sick room it destroys offensive germs, purifies the atmosphere, and leaves a delicious and refreshing fragrance.

SURGICAL INSTRUMENTS AND APPLIANCES.

THE collection of surgical instruments and appliances which has been brought together at this Exhibition is one of the strongest proofs that could be afforded of the progress that is being continually made in the art of surgery, and of the ever active endeavours of inventors and mechanicians to perfect the means whereby operations on the living subject may be more readily and more successfully conducted. Apart, moreover, from the actual instruments of action, those of precision are here exhibited in number and variety to excite the admiration and interest of the observer, and to demonstrate the rapidity with which the limits of diagnosis are being constantly extended. We do not doubt, indeed, that very many visitors to the Exhibition will experience a degree of astonishment at the array of novelties and improvements presented to their gaze; while a feeling of surprise, also, will be excited at the number of beautiful objects which, from a practical surgeon, will claim both interest and attention. Nor, though the exhibitors are of both home and foreign nationalities, need the English exhibitor feel any danger of comparison between the articles that are the produce of makers here and abroad. The instruments of English manufacture possess their own special features of excellence, as do those sent from other countries. There is much to admire in all, and their association in contiguity brings them only into honourable rivalry; and it cannot, from their very perfections, exhibit them in invidious distinction.

It is a somewhat difficult matter to decide how best to arrange a description of the articles to be dealt with in this place; but we shall, perhaps, best succeed in directing attention to the most important objects by pursuing the plan hitherto selected, and treating of them under the heading of the exhibitor's name. At No. 231 will be found the stall of

MR. P. BOURJEAURD, inventor of the elastic spiral appliances, who shows a case full of the apparatus in connection with which his name is so honourably known. The special air pads perfected by Mr. Bourjeaurd, and adapted for use in the various forms of hernia, have been widely acknowledged as presenting many features of superiority; but even these admirable instruments have received additional improvements, by the adjustment to the pad of a screw-spring, by which the pressure of the cushion can be accurately regulated, and which, in conjunction with the accessory supporting apparatus of the truss, converts the whole apparatus into the most perfect and ingenious arrangement ever devised for the relief of ruptures. The truss should receive the careful inspection of

every surgical visitor to the Exhibition. Another special improvement of the same exhibitor is his spiral elastic stocking, which is made in such a way as to avoid the defects of the ordinary knitted stocking, and which, further, is so constructed that the actual compression is exerted chiefly over the affected part. This is effected by constructing the stocking in sections of varying strength, and the whole is so beautifully and evenly made, that by means of it the best possible results of treatment can be secured. A special suspensory bandage, and respirator, to be found on the same stall, will repay examination; but we would especially recommend that the truss and stocking be not neglected.

Messrs. W. B. HILLIARD AND SONS.—The silver *Trachea Tubes* designed by Dr. Foulis are exhibited by this firm; these tubes are made of silver, without any projections to cause irritation of the wound, and being so simply adjusted as to present no difficulties, are well adapted to assist the comfort of the patient on whom tracheotomy has been performed; and the shape of the instrument also is adapted to secure the best results. Dr. Foulis's *Laryngoscope*, consisting of a glass globe filled with clear water fixed on a stand, and surmounted by a small mirror (see figure), is an admirable

substitute for the more complicated apparatus, while the results achieved by its employment after practice will compare very favourably with those following the use of expensive instruments. It is extremely cheap, being sold for 7s. 6d. complete. The *Hospital Foot Spray Machine*, made by Messrs. Hilliard, is an efficient and ingenious little apparatus for disinfecting during change of dressings, &c., and may advantageously replace the larger machine, except in important operations. The bellows is worked by the foot while the left hand holds the bottle and directs the spray, the right being left free. Dr. Pinkerton's *Splinting* is a light, elegant, durable, and universally serviceable material, out of which any form of splint can be cut with a pocket-knife, and for making rectangular splints, &c., Messrs. Hilliard manufacture a special screw and nut, of which a supply can be carried in the waistcoat pocket. Dr. Gray's *Metrotome* contains four

Fig. 1.

concealed blades running on a uterine stem, each blade cutting-surface measuring half-an-inch; it is a decidedly improved form of the instrument, and with the *Uterine Anchor* of the same inventor is a thoroughly reliable in-

Fig.

2.

strument. We append a figure of Dr. Whittaker's *Disarticulating Stethoscope*, which is a compact and useful variety of the instruments capable of being carried in the waistcoat pocket, and occupying no more room than a

coin and an ordinary pencil. It is not in any way a complicated instrument, and cannot get out of order. Of the many improved portable stethoscopes invented of late, it is probably the most easily carried.

Messrs. KROHNE AND SESEMAN exhibit on stand 45 a collection of the surgical instruments manufactured by them, many of which combine mechanical improvements over which this firm exercises control. The implements here shown are all most finished specimens of cutlery, and are many of them very elegant models of surgical instruments. Among these, special attention should be given to the *endoscopic instruments* devised by Lieter for examining the hollow viscera; to an instrument invented by Prof. Hughes to test the sense of hearing, and named after him, *Hughes's Audiometer*; and to an aluminium hip-splint (Thomas's) in which extreme lightness is combined with rigidity. A large number of other objects are to be seen on the stall, many of them likely to be of considerable interest, such as stricture dilators, splints, camps, dressings, &c., &c. Messrs. Krohne and Seseman are the only manufacturers of *Lieter's* patent pliable metal temperature regulators, by means of which any required part of the body can be submitted to any particular constant temperature. These regulators consist of pliant metal tubing, which can be shaped to fit any part of the body, and through which water of the required temperature can be passed, syphon-fashion, from a raised receiver. In connection with it a special heating apparatus is also made, and the whole contrivance affords one of the most elegant and useful apparatuses we have seen for some time; the subjoined figures illustrate the contrivance. *Lieter's Patent Glass Irrigator* is shown by the same firm; it is an ingenious and useful arrangement for irrigating wounds and washing out cavities.

Messrs. ARNOLD AND SONS show several novelties introduced by them to the profession. Of these, the exploring aspirator, manufactured in accordance with the suggestion of Dr. Hensley, is already favourably known on account of its combining several distinct advantages over other instruments in use. The *Instantaneous Vaccinator*, for speedy performance of vaccination, and an ingenious combination of knife and fork, termed the *Desideratum*, and some admirable curved scissors, which can be depended on for doing their work when operating for vesico-vaginal fistula, all deserve to be noticed. Of the other exhibits, we would mention especially the

autopsy cases, which are well fitted for work, and also a bag containing most of the articles required in minor surgical operations.

Messrs. MILLIKIN and DOWN show a very interesting skeleton fitted with artificial ligaments of elastic webbing by means of which the mode of reducing dislocations may be demonstrated. Several articles suggested by Mr. Bryant are displayed, among them being improved *Talipes Shoes*, and a most useful and ingenious sinus scissors. A very interesting exhibit, too, is Mr. Howse's new flexible silver-wire trachea tube, which combines flexibility with rigidity; and also Mr. Golding Bird's trachea dilator. Messrs. Millikin and Down have several admirably arranged patterns of pocket cases, the contents of which in many instances present novel features of great improvements. The whole stall is well filled with interesting objects, and the visitor will do well to give it a considerable share of his attention.

Messrs. MAYER & MELTZER exhibit a remarkable novelty in the form of a *registering clinical thermometer*, with which, it may be anticipated, unusually accurate observations may be made. This machine has the form of a watch, and possesses a glass-protected face, on which the temperature it records is marked by a delicate hand. By this most ingenious arrangement the inventor, Mr. Mayer, asserts that immediate and highly accurate observations may be made, while its durability and compactness give it a great superiority over the ordinary instrument in use. We cannot but think that if the readings are to be depended on in actual use, and this can be determined only by fair trial, this thermometer will prove of great service in clinical work; it undoubtedly reflects much credit on the inventor. An improvement in *tracheotomy tubes* is introduced by Messrs. Mayer and Meltzer, by constructing a stem to a gauge of four invariable sizes, thus ensuring accurate fitting of parts of tubes of the same size. A spray engine, with self-filling boiler, is worthy of notice, as also is a new *universal truss*, fitted with self-adjusting pads, a new elastic, hard, light, and durable substance termed *coraline*, being used in its manufacture. A very fine and delicate *forceps*, designed for extracting foreign bodies from the urethra, *meatus auditorius*, &c., is shown, and is so constructed as to permit freedom of action on the part of the operator, in an admirable manner. A *rhinoscopic mirror*, pessaries, and perforated leather splints, contained in this case, ought also to be carefully examined. *Mackenzie's œsophagoscope*, for examining the œsophagus in stricture of that organ, is a useful instrument; and for purposes of class demonstration, a pelvis or an adjustable stand, with a mannikin, will be found of much service.

Messrs. WEISS & SONS show a magnificent collection of instruments, the workmanship of which is of the most excellent description, and leaves nothing to be desired. In common with almost all the other exhibitors in this section, they have on their stall a number of carbolic spray producers, and with them a new lamp is combined, which, for the purpose of evolving a more intense heat, is provided with four or six wicks. The spirit from which the flame is derived is contained in a reservoir protected by a reflector. Another improvement consists in the dispensing of the separate reservoir for medicated lotions, &c., which are enclosed in an enlargement at the base of the spray. In another portable engine, by an ingenious arrangement the handle is fitted with a boiler, which, when empty, liberates a spring extinguisher to the lamp, whereby damage to the machine when all the water it contains is evaporated, is avoided.

The fitted cases of instruments for various purposes, shown by Messrs. Weiss & Son, are most beautiful examples of what such things should be, and especially would we commend to notice their ophthalmic and operating cases. The oculist can nowhere, perhaps, find himself so admirably provided for as by this firm, and the operating surgeon, too, will find nothing better for his purpose than the major and minor cases fitted by them. Among the more notable special instruments may be mentioned a convenient but powerful litho-clast, manufactured at the request of Sir H. Thompson, a very perfect and complete galvanic cautery, which, in spite of the disfavour into which this instrument is growing, might very well tempt to its use; an exploring knife, on a model suggested by Mr. Holden, and remarkable for length and great narrowness of blade; several improved *écraseurs*; and an assortment of rubber bandages and syringes, with hard vulcanite pistons.

MR. W. MARTINDALE shows a portable inhaler which is admirably adapted for inhalation, by its means, of hot medicated air. The apparatus is of tin, with an earthenware mouth-piece. It is provided with a woollen covering, which allows it to be handled without burning the fingers. It is in two parts, attached by means of a bayonet catch. When in use, the lower chamber is filled with water at the required temperature (about 140° to 150° F.),

until the holes, *c c*, establishing communication between the interior and the outside channel, are about a quarter of an inch below the surface of the liquid. *d d* is an earthenware mouth-piece; *e* is a ring handle. When charged for use, the patient will inhale medicated hot moist air, which has been fully charged and heated by passing through the hot medicated liquid in the interior. The act of inhaling, which will be accompanied by a gurgling noise, is done with great ease, as, although the liquid becomes thoroughly agitated, the column of water to be displaced is not deep, and the air passes freely through a number of holes. The exertion on the part of the patient is thus reduced to a minimum. The portable inhaler is light, not easily broken, and, including the thermometer, it packs in a parcel 7 in. + 5 in. + 5 in. For many purposes it will prove a most useful and efficient apparatus. Mr. Martindale also exhibits a number of articles connected with the practice of anti-septic surgery, among them being *chromic catgut ligatures*, made after the plan recommended by Mr. Lister. *Eucalyptus gauze*, which the same surgeon suggested as a non-irritating substitute for carbolic, and other articles, all of which will prove interesting to visitors, are exhibited.

Messrs. SOUTHALL, BROS., and BARCLAY, of Birmingham, are the proprietors of several very important and highly valuable specialties, specimens of which are to be seen on their stall, No. 225. The *Ladies' Sanitary Towel*, consisting of a pad of absorbent cotton wool, rendered antiseptic by boracic acid, is a very great advance on the old-fashioned napkin, and the use of it in lying-in hospitals and by the general public has already been attended by advantages which it is impossible to over-

estimate. The elegance and comfort combined in these towels is likewise as considerable as the safety conferred by their use. *Tenax*, an absorbent and antiseptic substance, is a vastly improved substitute for the old-fashioned oakum employed in dressing wounds, &c. It possesses the tarry smell of oakum, but is of a light brown colour and has a much softer and finer texture. Discharges are absorbed and retained by it, and offensive odours destroyed. Its inexpensiveness and efficiency should recommend it largely where economy is an object. *Absorbent and Antiseptic Pads* are made by this firm that perfectly fulfil the conditions implied by their name. They are well and suitably made, and are very absorbent, while they effectually disinfect the discharges with which they come into contact. They are also elastic, and thus facilitate the application of pressure on the part they are adjusted to. *Prepared Splints*, made from millboard, are exhibited by Messrs Southall and Co., which possess the advantage of drying rapidly, being easily softened and moulded, and admitting of repeated use after cleaning. They are cheap and useful substitutes for the more expensive splints. Improved *Hospital Strapping* is also shown, which remains pliable and may be applied without the necessity of previous warming.

Messrs EVANS and WORMULL have a *Folding-Double Inclined-Plane Splint*, made of galvanised iron, consisting of back-piece, sides, and foot-rest, an oval opening accommodating the tendo achillis and heel. Various movements are secured by means of joints and screw-bolts, and by its use bandages are rendered unnecessary, except for the foot. Dressing of the wound can be easily accomplished, and in most positions it is readily seen, while the use of a cradle is optional, the sides of the instrument sufficiently keeping off the bed-clothes. This splint will be found very useful for many purposes, and especially in hospital and tent practice. *Spanton's Hernia Instrument* is devised for the immediate radical cure of hernia. It consists of a screw which, the hernia having returned, is made to pierce the covering of the protruded intestine, and is after some manipulation left in a position where it will excite inflammation along the canal whence the hernia descended. From this it is removed after time has elapsed sufficient to set up an amount of induration which will prevent further descent of the intestine. The results obtained by Mr. Spanton have been very encouraging, and there seems good reason to think the operation may be generally resorted to with advantage, more particularly on young people and congenital cases. Mr. Spanton has also devised an *Improved Suture Needle*, which Messrs. Evans and Wormull manufacture. It is shaped, as is the hernia instrument, like a corkscrew, and is particularly adapted for use in situations where space is limited, as in operating for fistula, cleft palate, &c. The *Surgical Dressing Basins* made by the same firm are very useful appliances for the dressing of wounds, ulcers, &c., which require the application of fluids. They are made with a variety of curves, and in such a manner that they may be applied to any part of the body so as to catch the lotion or dressing with which the injured surface may be sponged. By use of them much unpleasantness, due to wet, &c., of bedding and clothing can be avoided, and for home employment particularly they are calculated to be of service.

Messrs. MATTHEWS BROTHERS display a large and beautiful assortment of steam spray producers, the workmanship and elegance of which will well repay careful examination. This firm has introduced several very important and excellent improvements in the construction of these engines, whereby their efficiency and appearance are both considerably added to. We would especially suggest examination of the "inflex apparatus," the only drawback to which is the price it has been necessary to put upon it. The other exhibits of Messrs. Matthews include their cases of instruments, hypodermic syringes with a lancet-shaped point of solid gold, an ingenious bullet forceps by means of which bullets of different sizes may be extracted, and some rubber-coated lead suture buttons provided with projections for the attachment of wires. There are very

many articles on this stall that will be found to repay inspection, but which need not be separately mentioned.

Messrs. JAMES ALLEN and SON.—This firm is well known in connection with the manufacture of portable Turkish baths, vapour and hot-air baths, bronchitis kettles, &c.; and the continual improvements introduced by them in the articles which constitute their specialities justifies the confidence with which they are everywhere regarded. A ventilating croup kettle and several varieties of bronchitis kettles are shown; the former is constructed to admit both air and steam to a bed, and is intended for use chiefly in cases of diphtheria. If needed, the steam can be medicated, a special apparatus being included with the kettle for this purpose. This kettle possesses many important advantages that should lead to its being generally used where the ordinary bronchitis kettle is made to do duty. The make and finish of all the goods exhibited by Messrs. Allen are of the first kind, and the spray engines shown by them, while being well manufactured, strong and good-looking machines, are also less costly than the majority of such instruments fitted with expensive accessories.

Dr. G. H. PHILIPSON, of Newcastle-on-Tyne, contributes a most interesting relic to the exhibition, in the shape of the *Original McIntyre's Splint*, the following description of which Dr. Philipson has been kind enough to write for us, specially:—The splint is made of brass throughout, and is perforated with holes in order to lighten it. The thigh-piece is lengthened by one plate sliding in the other, being fixed by a clamp screw. The leg-piece, consisting of thin rods, is lengthened by means of shifting the foot-piece, this working on a screw. The joint between the thigh and leg-pieces is double saddle-shaped, and is fixed by a clamp behind. There is a slot at the top of the foot-piece for attaching the tapes of the sock which suspends the foot and ankle. By the arrangement of altering the length of the thigh and leg pieces, the splint is applicable for the treatment of various fractures and injuries of the lower extremity.

FOSSILINE, a novel hydro-carbon jelly, which is superior to other petroleum preparations in consistence and smoothness, is shown by Messrs. Evans and Co., the inventor being Mr. Savar, whose name is adopted to distinguish the various articles into the composition of which fossiline enters. Among these we would especially commend the patent fossiline plaster, which immediately adheres without warming, and is an excellent form of adhesive; also the fossiline corn-plasters, these little pads being the most perfect and pliant of any we are acquainted with. We propose to speak further of these novelties after making trial of them in practice.

NOTIFICATION OF INFECTIOUS DISEASES.

At the far end of the Session of Parliament an attempt is being made to slip through the House of Commons a Bill to compel the profession to notify to the Sanitary authority the occurrences of each case of infective disease which comes to their knowledge. The Bill is introduced by Mr. Hastings, Sir Trevor Lawrence, and Dr. Farquharson, and is identical in terms with the Irish Bill to which we have so frequently referred, except that the notification fee is fixed at half-a-crown, instead of the symmetrical shilling at which Mr. Gray assessed the value of medical services in Ireland. The Bill has been read a second time and, if not blocked by an opposing motion, may get through before Parliament rises. As it does not extend to Ireland, the incompatibility of it with the wishes of the medical profession is not so evident, but as we know that the profession in England is by no means decided as to the expediency of such a measure, we think it necessary to warn them that the passing of the measure is imminent. We learn that the Irish Medical Association has taken steps to prevent the extension of the Bill to Ireland, apprehending that some enthusiastic member might steal a march by moving the omission of the clause which exempts that division of the kingdom.

Literature.

DISEASES OF CHILDREN. (a)

DR. DAY'S work on the Diseases of Children will be welcome to those who cannot find all they wish for in the manuals extant on this subject: such as have been written by West, Churchill, Hiller and Eustace Smith, in our own country, and by Bouchut, Vogel and Steiner abroad.

Instead of dealing with diseases of childhood individually and in detail, Dr. Day has chosen, and wisely we think, to discuss the more important among them. To the execution of this task, the author has devoted an extensive personal experience in clinical work, both in hospital and private practice. The student or practitioner, who needs a helping hand, strengthened by the knowledge of recent research, will not be disappointed if he turns to these pages; for he will find therein a painstaking collection of scientific facts reduced to practical usefulness, by being submitted to the judgment of an impartial and well balanced mind.

In the chapters before us, will be found such a mass of valuable information, derived from the best authorities, and illustrated by personal experiences, that it would be impossible to do justice to them by a short critical review. Suffice it to say, that, most of the essays will well repay a careful reading, and many a practitioner will find old hospital contemporaries quoted among recent authorities; this gives to Dr. Day's book an interest in perusal which many will be pleased to acknowledge. Conjointly with valuable theoretical information on children's diseases, the author supplies accurate and valuable assistance for the selection and use of therapeutical remedies.

In the chapter on "Milk, Diet, and Hygiene," especial reference is made to milk as a probably potent means of transmitting disease, where such milk has undergone putrefactive changes before ingestion into the body; as well as being the means of introducing as an aliment, germs of specific diseases. The researches of Professor Low, of Cornell University, the typhoid epidemic of 1873, and others similar in kind serving as illustrations.

Several valuable hints are given as to diet in infancy and childhood. The directions however, for the administration of cows' milk to infants are wanting in definition. We notice too, in other parts of the book, a want of definitions as regards treatment—the outcome probably of condensation. In the desire not to omit anything of importance, an author runs the risk of bewildering by an *embarras de richesses*. A student especially, and the practitioner in a less degree, wants to know the best treatment available and so far as may be the reasons for its employment. The directions for diet, are followed by a somewhat erratic section on the administration of drugs and remedies, which appears to supply the place of the information one looks for, and would gladly find on the important subject of hygiene.

In the chapter on Typhoid Fever, the author disavows "any belief in infantile remittent fever, as caused by a separate and distinct poison, or that the disease differs in its nature or causes from that of typhoid." He then enters upon an argument which appears to clash with the "belief" previously expressed. The knowledge of the strong tendency of all febrile diseases to remission during some part of the day, establishes emphatically the non-existence of any entity in disease, such as "infantile remittent," and it is difficult to realise the necessity of making an exception in favour of modified typhoid. Some medico-chirurgical questions, of great interest medically, are ably discussed, such as croup and diphtheria, the non-identity of which the author maintains. Intussusception and invagination are also carefully considered. The paragraph on the important subjects of typhilitis and peri-typhilitis, is surprisingly brief, and we can well imagine that surgeons will question the propriety of trusting to Nature if an abscess form, to establish an opening either into the bowel or externally through the abdominal wall, "even on the assurance of the chance of recovery being greater in the former than in the latter case." Even the opponents of Listerism will admit the immense advantage and safety it confers upon all abdominal affections needing surgical aid, and among these we doubt not may fairly be included suppuration within or about the cæcum.

(a) "On the Diseases of Children." By W. H. Day, M.D. London: J. and A. Churchill.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

PROFESSOR H. ALLEYNE NICHOLSON, AND HIS STUDENTS.—The students who have attended the natural history class of the University of Edinburgh during the Sessions 1879-81, on the 25th ult., presented Professor H. Alleyne Nicholson with an address as a token of their respect and esteem for him. On behalf of nearly 500 students who subscribed the address, which was beautifully illuminated, Mr. R. E. Horsley, Mr. J. S. Turner, and Mr. S. D. Hallows made the presentation. The address, after expressing the admiration of the students at the manner in which the Professor had conducted the class, said: "Your uniform kindness and tact in inciting your often wearied followers to fresh efforts have won their well-merited application. The interest you have imparted to your lectures, the fidelity with which you have endeavoured to remove the difficulties from our path have enabled us to follow the intricacies of zoological science more readily by far than we had ventured to hope. We are sure your example and perseverance will be a guide to many, and will ensure to them a solid foundation for their future studies." Dr. Alleyne Nicholson then returned thanks to the unexpected and handsome mark of their regard presented to him, which was an evidence, although that was not needed, of the complete harmony and good feeling which had always characterised their relations.

EDINBURGH.—HEALTH RETURNS.—The deaths in Edinburgh during the week ending with Saturday, the 23rd ult., numbered 61, deducting 8 country cases. This shows an annual death-rate of 14 per 1,000, and a decrease of 20 deaths as compared with the same week last year. Four deaths occurred from zymotic diseases, none of them occurring in the southern suburbs.

ARBROATH.—THE OUTBREAK OF SMALL-POX.—The Sanitary Inspector having reported to the Board of Supervision the outbreak of small-pox in Arbroath, Dr. Littlejohn, Medical Officer of the Board, visited Arbroath on the 23rd ult., and made inquiries into the matter. He inspected the temporary hospital, constructed of wood, to accommodate about twenty patients, which has been erected near the Infirmary, and is now ready for occupation. It is understood that he expressed himself satisfied with it. There are understood to be about twenty cases of small-pox at present in Arbroath, and it is thought they all originated from the recent case on board the Norwegian vessel in the harbour. Almost all the cases are mild. Three of these are under treatment in the cottage hospital, and the others in their own houses. On the recommendation of the local authority a considerable number of the inhabitants have been revaccinated. A case has occurred in Edinburgh in connection with this outbreak. A young man who left Arbroath to spend a few days in Edinburgh was taken ill of small-pox in the city. His case is being treated in the Edinburgh Small-pox Hospital.

ABERDEEN.—SMALL-POX.—Intimation was brought to the French Consul at Aberdeen, on the 27th ult., that a seaman on board the *St. Pierre*, fishing-boat, belonging to Boulogne, was suffering from small-pox. The latter was lying at the time some distance off the Aberdeen Harbour, and the Sanitary Inspector at Aberdeen having been communicated with, orders were given that the man should be removed from the ship to the Canningar Hill Hospital, at Aberdeen, and this was done in the course of the day. The

disease was well developed. The crew of the boat consisted of twenty-one persons.

MORTALITY IN GLASGOW.—The deaths in Glasgow for the week ending with Saturday, the 28th ult. were at the rate of 23 per 1,000 per annum, against 23 in the preceding week, and 25, 19, and 25 in the corresponding periods of 1880, 1879, and 1878.

HAWICK MILK SUPPLY AND ENTERIC FEVER.—An outbreak of enteric fever has taken place in the southern part of Hawick, where the houses are all new. At a meeting of the local authority, held on the 28th ult., the Superintendent of Police reported that in nearly every case the houses had taken in milk from the same farm, where the fever prevailed leaving no doubt whatever in the minds of the authority that the milk had been the medium of transmitting the disease; and it was resolved to prohibit the farmer in question from sending any further supply of milk to the town in the meantime.

GLASGOW HOSPITAL AND DISPENSARY FOR THE DISEASES OF THE EAR.—A meeting of the Directors of this Dispensary was held in the premises, Buchanan Street, on the 28th ult., Charles M. King, Esq., presiding. It was stated that upwards of 300 cases a month passed through the hospital and dispensary, and that brain diseases affecting the ear were on the increase. It was also mentioned, we think erroneously, that Glasgow was the first city out of London where an institution of the same kind had been established. The chairman, in the name of the directors and Dr. Cassells, the superintendent, then presented special certificates to the following four students:—Mr. James Robertson, senior assistant, Mr. John McCall, Mr. W. Bradley Violette, Mr. George Haddon. Mr. Richard Robb, Mr. John Wyllie, and Mr. Robert Steele were presented with certificates from Dr. Cassells. We are concerned as to the increase of ear diseases from affections of the brain; of the converse we have been a long time satisfied—that the influence of ear diseases on brain was decidedly on the ascendant!

CHARGE OF CIRCULATING OBSCENE LITERATURE IN GLASGOW.—It seems, after all, that the Glasgow authorities are capable of being roused to a sense of duty in the matter of quack leaflets. It is surely, however, unkind that an example should be made of a stranger when Dr. Samuel Levenston's bills continue to be largely circulated, as formerly. At the Central Police Court of Glasgow, on the 28th ult., an American "Professor" and two accomplices were charged with distributing indecent or obscene leaflets, in contravention of the Glasgow Police Act, section 135, which portion seems more honoured in the breach than in the observance. "Professor" Hale admitted circulating the leaflet, but pertinently added in extenuation that at the present time there are being sold and circulated in Glasgow leaflets and books far worse than his. On a promise to cease circulating the leaflets the charge was withdrawn. We are truly grateful to America, and have cause to be so, for much that has benefited the human race. We can do with the sewing-machine, and her magnificent bullocks; but she would command more universal gratitude if she retained such cattle as her quack ministers and quack doctors to luxuriate in the quietude of her own magnificent bosom.

THE EDINBURGH OBSTETRICAL SOCIETY.—An immense amount of native oratory seems to be lost to Glasgow (we noticed some of it last week) through the attraction of the Edinburgh Obstetrical Society. We are tempted to ask the questions, Are Glasgow audiences not sufficiently appreciable? Are they too critical? Or do they too justly value the lucubrations of the peripatetic men-mid-

wives, to be deemed worthy of inheriting the first-fruits of the juvenile scientific labours? When two nights, at a scientific society, are spent over the composition of a soap, one night over that of a lotion, and so on, the passing notice of a smile is hardly sufficiently significant of contempt. The "talkee talkee" resolves itself into the following phases: The "rising obstetrician" has listened with profit, pleasure, and admiration, to the paper just read. For his own information, however, he would like to ask a question: "Has his friend, Dr. ——— ever tried such-and such a drug? He does not quite agree with the conclusions drawn as to the ovarian hyperæsthesia, preferring rather the elucidation of Professor ———, of Jena or Vienna, whose practice it has been his good fortune to witness," and so on *ad infinitum*. We wish the Edinburgh Obstetrical Society joy of the contingent of rising Glasgow obstetricians who grace and adorn its meetings.

Medical News.

Royal College of Physicians of London.—The following candidates having passed the required examinations, were admitted members on July 28th.—

Anderson, James, M.D. Aberdeen
 Fenwick, Bedford, M.D. Durham
 Gulliver, George, M.B. Oxford
 Hadden, Walter B., M.D. London
 Uthoff, J. Caldwell, M.D. London
 Marriott, Peter W., M.D. St. And.
 Thurnfeld, T. W., M.D. Aberdeen
 Tooth, H. H., M.B. Cambridge

Admitted Fellow:—

Siordet, James Lewis, M.B. London, Meantons

The following were admitted Licentiates on July 28th.—

Barrat, Herbert James	Jones, Robert Dennett
Barton, William Edwin	Laimbeer, Frederick James
Bradshaw, Oswald George D x	Lewis, William Henry Phillips
Butler, Thomas Edward	Marsh, Frank
Clark, William	Neatby, Edwin Awdas
Clegg, Walter Thomas	Starling, Edwin Alfred
Copley, William Henry	Sutherland, William Rose, M.D.
Corlett, William T. M.D. Wooster	McGill
Crook, John S ddon	Sykes, Matthew Carrington
Hitch, Frederick	Tidswell, Herbert Henry
Inger, John William	Wells, Alfred Ernest

University of London.—The following have passed the first B.Sc. Examination:

FIRST DIVISION.

Beare, Thomas Hudson	Scott, Charlotte Angus
Bowman, Henry Claxton	Shore, Lewis Eric
Forsyth, John	Stroud, Henry
Hodgkinson, Mary	Tarn, Albert
Leon, Joseph Abraham	Waddell, John
Le Tall, Benjamin Bower, B.A.	Williams, Walter Collingwood
Mitchell, Alice	Winter, Henry Smith
Riley, John Thomas	Wright, Mark Robinson

SECOND DIVISION.

Barber, Charles Alfred	Morgan, Thomas Matthew
Benham, Wm. Bland Shoppee	Moul, Frank
Beak, Marian	Orchard, Henry Langhorne
Corner, Samuel, B.A.	Porter, John Wynne
H-y-s, Rowland George, B.A.	Estchious, Henry Andrew, M.A.
Hunton, Sidney Walker	Shipley, Arthur Everett
Jones, Samuel Cromwell	Small, Evan William
Lawson, Thomas Atkinson	Staples, Henry John
Moy, William Page	Tomaselli, Giovanni Domenico
Merson, John	Webb, Mary Isabella
Molony, John	

Edinburgh University.—MEDICAL EXAMINATIONS.—The following candidates have passed in the final examinations for medicine:—

J. F. Bateson, R. C. Bennett, Thos. Northwick, William Brydon, F. B. S. Corser, W. R. Dalzell, O. V. Delapina, Robert Fearas, J. M. Ferguson, Frank Fraser, W. B. Fry, J. L. Gibson, Alex. Grant, F. W. Grant, Wm. Harding, Alfred Harbey, S. Harwood, S. W. Haynes, J. M. Hoffman, E. J. Lawson, R. J. J. Macdonald, Samuel Mackay, T. G. McLaughlan, J. D. Malcolm, Jas. Mill, H. F. Mudie, T. F. Myles, B. O. Norfor, Jas. Orr, A. A. Paikell, G. C. S. Perkins, D. W. L. Ritchie, J. R. S. Robertson, G. V. E. Rhan, J. M. Ross, Johannes Sauer, W. O. Scholtz, W. J. Sinclair, S. W. Smith, John Sotley, B. T. Sutherland, A. H. Thomas, John Valentine, E. B. O. Walker, Alfred Ward, A. F. L. Wells, J. H. Williams, H. J. Wolsley.

The following have passed their examinations in anatomy and institutes of medicine:—

H. M. Hardcastle, E. B. Hector, R. D. Helm, D. de N. Hugo, H. Ley, G. M. Reid, A. A. Robinson, C. G. Thorp, J. E. Godfrey.

NOTICES TO CORRESPONDENTS.

CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 28 strings for holding each volume of the *Medical Press and Circular*, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

NOTICE TO SUBSCRIBERS.—We would ask the forbearance of our readers for the delay in issuing this week's number of the Journal. We have purposely withheld its publication for twenty-four hours in order to present those who were unable to be at the Congress with Sir James Paget's Inaugural Address, feeling confident that with this before them the delay would be of little moment compared with the pleasure experienced in reading it.

CORRESPONDENTS are asked to extend their indulgence for omissions in the present number, owing to pressure of Exhibition and Congress matter.

D^r. WORLDMONT (Bruxelles).—Proof of your communication not received at time of going to press.

DR. MILNER FOTHERGILL's paper shall appear in our next.

MR. STONE will find a very interesting paper in the August number of the *Spectalist* on "Abdominal Section" by Mr. Lawson Tait.

DR. MORTON.—We believe it has not yet been settled who is to deliver the sermon in Westminster Abbey on Sunday next in the place of Dean Stanley deceased.

MR. WOOD.—The practice is one which is open to very serious objections, and is certain eventually to become a source of grievous annoyance.

SANITARY INSPECTION OF HOTELS.—A correspondent asks if a great public need would not be served by the discussion at the International Congress of compulsory inspection of hotels. With so many foreign visitors over here, he thinks that it would be an assurance to them that their health and comforts were considered. To the suggestion we can only reply that such discussion, even if there was time for it, would be of no practical value, as our visitors will have left us before any resolution could be carried into effect. Moreover, the principal hotels of the metropolis are excellently provided with sanitary appliances that visitors need be under no fear of contagion, or other calamity incident to bad drainage or water. We would, however, caution them to be careful what hotels they select on the Continent, as sanitary arrangements are in many of them quite unknown. Inspection and registration has been recently introduced into some of the Roman hotels, and which we shall be glad to hear that a similar system has been established in other cities.

HOSPITAL FOR CONSUMPTION, BROMPTON.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—I enclose, with the committee's compliments, a card to view the new building on Monday next. I shall also be glad to send cards to any of your readers who may desire to be present on that day upon receipt of application.

Your very faithful servant,
HENRY DOBBIN, Secretary.

MR. W. B. (Infirmary, Leeds).—If the article is short and concise we shall be pleased to receive it.

MR. BAILLY WALKER.—The article "Dietetic Study," by Billinger, of Halle, has been received, and shall be noticed.

DR. CULLMORE's paper is unavoidably held over for want of space. Each week for the last month we have given an extra sheet, but have been unable to keep pace with the demand.

DR. A. C. will find the subject referred to in our issue for July 20.

NATIONAL DENTAL HOSPITAL.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Permit me, through your columns, to make known that all members of the International Medical Congress are cordially invited to inspect this hospital, which will be open daily from 9 a.m. to 7 p.m. during the season.

I have the honour to be, Sir,
Your obedient servant,

149 Great Portland Street, W.
ARTHUR G. KLUGH, Sec.

MR. TALBOT.—We tried to read Lord Clifton's absurd letter through, but stopped short at this passage: "The fact that the unvaccinated die in the high ratio of 85 to 50 per cent to cases is valueless, unless you can prove that the rate of vaccinated mortality has been sufficiently low to lower the original pre-vaccinal rate of deaths to cases. This is not the case, taking the grand total without reference to vaccination." We wonder what kind of argument would satisfy Lord Clifton and his followers in the Anti-Vaccination League.

A CHEAP AND EFFECTUAL DISINFECTANT.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—It may not be uninteresting to some of your readers to know that a mixture of the *nitrate of lead* and *common salt* constitutes a very inexpensive and effectual disinfectant. Take half a drachm of the *nitrate of lead* dissolved in a pint or more of boiling water, and add to it a bucket of water in which is dissolved two drachms of *common salt*; mix them together and the solution is ready for use.

A cloth or sheet dipped in it and hung up in a room will at once

purify it, and likewise, if thrown down a sink or closet, as it soon destroys all those unpleasant and noxious odours which are generative of disease.

The advantages consist in its cheapness and the facility with which it can be made. I am, Sir, yours, &c.,

West Cliff, Ramsgate. E. MARLETT BODDY, F.R.C.S.

A CALCULATION.—An American medical journal has found that there are from 100,000 to 200,000 hairs in a woman's head. The number of hairs in a man's head depends considerably on the time he has been married.

DR. S.—Branches of the Metropolitan Provident Medical Association are now in working order at 5 Lamb's Conduit Street, W.C., and at 3 Leicester Street, Leicester Square, London. Similar institutions are in existence in some provincial towns having an excess of income over expenditure.

A VISITOR.—You will be able to examine the work mentioned at the International Medical and Sanitary Exhibition at South Kensington.

Vacancies.

Carnarvon Infirmary, Bangor.—House Surgeon. Salary, £100, with board. Applications to the Secretary before August 11.

Hampstead Provident Dispensary, New End.—Medical Officer. Applications to be sent to the Secretary, J. W. Fenn, 23 High Street, Hampstead, not later than August 6.

National Dental Hospital, Great Portland Street, W.—Dental Surgeon and Lecturer on Dental Surgery and Pathology. Applications to the Secretary on or before August 10.

North Stafford Infirmary, Stoke-on-Trent.—House Surgeon. Salary, £120. House Physician. Salary, £100. Each with board. Applications to the Secretary before August 17.

Stockton-upon-Tees Hospital.—House Surgeon (non-resident, doubly qualified). Salary, £200 per annum. Applications to the Secretary by August 9.

Appointments.

BLANEY, J., M.R.C.S., Medical Officer of Health to the Falmouth Union Rural Sanitary Authority.

FOX, T. C., M.B. Lond., Physician to the Skin Department of the North West London Free Dispensary for Sick Children.

GAIRDNER, J., M.R.C.S., Medical Officer to the Welford and Alveston Districts of the Stratford-on-Avon Union.

GOULD, A. F., F.R.C.S. Eng., M.B. Lond., Surgeon to the North West London Free Dispensary for Sick Children.

GUNN, R. M., M.B., C.M. Edin., Surgeon to the Eye Department of the North West London Free Dispensary for Sick Children.

JONES, J. T., L.R.C.P. Ed., L.R.C.S. Ed., Medical Officer to the Llanelli District of the Oswestry Union.

KIRBY, T. C., L.K.Q.C.P.I., M.R.C.S., Consulting Physician to the North West London Free Dispensary for Sick Children.

LAYCOCK, G. L., M.B., C.M. Edin., Physician to the North West London Free Dispensary for Sick Children.

Ogilvie, L., M.B., C.M. Edin., Physician to the North West London Free Dispensary for Sick Children.

PRESTON, W., M.B., M.Ch. Edin., Medical Officer to the First District of the York Union.

RINGER, S., M.D., F.R.C.P. Lond., Physician to the North West London Free Dispensary for Sick Children.

Births.

HARRISON.—July 23, at 23 Gable Terrace, Liverpool, the wife of D Harrison, M.R.C.S., M.K.Q.C.P., of a son.

MILWARD.—July 24, the wife of W. Clement Milward, Surgeon A.M.D., of a son.

Deaths.

PHILLIPS.—July 29, at Woodbridge, Suffolk, Elizabeth, widow of B. Phillips, F.R.C.S., F.R.S., aged 84.

PROCTOR.—July 21, suddenly, Balhelvie, R. F. S. Proctor, M.B., C.M. Aber., aged 34.

RIORDAN.—July 18, at Ivy Bank Villa, Gravesend, the infant son of Surgeon-Major Riordan, A.M.D.

TAYLOR.—July 24, at the residence of his father, David Taylor, M.R.C.S., Kennington Park Road, S.W., Arthur Taylor, M.B., M.R.C.S., late of Wanganui, New Zealand, aged 37.

TIDY.—July 24, at 3 Mandeville Place, London, W., Violet, wife of Charles Meymott Tidy, M.B., and second daughter of Dr. Horace Dobell, of Harley Street, W., aged 27.

TURNBULL.—July 24, at Neckergat, Belgium, Alexander Turnbull, M.D. Ed., aged 86.

WILSON.—July 25, suddenly, at Stockton-on-Tees, John Wilson, L.F.P.S. Glas., L.R.C.P. Ed.

SOCIETY for the RELIEF of WIDOWS and ORPHANS of MEDICAL MEN.—Established 1758. Incorporated by Royal Charter 1864. Registered medical practitioners residing in London, or within a radius of twenty miles, may, in case of their death, secure their widow an income of £51, and as-bastance for their children up to the age of fifteen, by becoming members of the Society. Funded capital, £76,495 1s. 5d. For particulars apply to J. B. BLACKETT, Esq., Secretary, who attends at the office, 53 Berners Street, every Wednesday and Friday, from 4 to 5 p.m.

CASH ADVANCES MAY BE OBTAINED by Members of the Medical Profession who may desire temporary accommodation pending the collection of their accounts.

No charge of any kind unless the business is carried out. Apply to the Imperial Discount Company, Limited, St. Clement's Lane, E.C.

WM. BAKER, Manager.

CALCULUS IN THE FEMALE BLADDER. (a)

By ANGUS MACDONALD, M.D., F.R.C.P., F.R.S.E., Physician to, and Clinical Lecturer on Diseases of Women, Royal Infirmary, Edinburgh.

(Continued from page 94.)

DIAGNOSIS OF STONE IN FEMALE BLADDER.

The diagnosis is peculiarly easy. The modern practice of careful abdomino-vaginal examination renders the exploration of the bladder by touch both easy and thorough. In this way the existence of a foreign body in the bladder, its size and connections as also its mobility or otherwise can usually be determined with great accuracy. To confirm the diagnosis, if need be, in most adult cases the index finger may, without danger to the patient, be passed along the urethra and the stone felt. But that is only seldom necessary, and a better test of the character of the stone can be got by passing a sound and feeling the peculiar sensation which the calcareous matter communicates to the instrument as well as hearing a grating noise. This can be done without subjecting the patient to either the pain or the risks of forcible dilatation of the urethra. In addition to these means we have the indications afforded by the irritation which the stone causes in the bladder, the pain on micturition, and the occasional interruption of the flow caused by the stone when it happens to fall down against the entrance to the urethra. The condition of the urine, especially its microscopical characters, is also to be considered. In the present case the size of the stone and the disturbance it gave rise to rendered the diagnosis specially easy.

TREATMENT.

As to treatment, in our case the size of the stone precluded entirely any thoughts of removing it by the urethra; whilst at the same time it equally clearly showed that the supra-pubic operation was unnecessary. This being so, there remained only to decide between the operation of

lithotripsy and vaginal lithotomy. The looseness and largeness of the vagina were in favour of the latter. My own want of special skill in lithotripsy, and the fear that a troublesome nucleus would be found in the centre of the stone, which would render that operation difficult as well as dangerous, along with the unhealthy condition of the bladder, induced me to avoid lithotripsy; and the sequel proved that it was a happy circumstance for the patient that I did not have recourse to it. I accordingly determined to perform vagino-vesical lithotomy, which I effected as above described.

It is now universally agreed that in such cases, if the condition of the mucous membrane be healthy it is better to sew up the wound at once, as the edges readily heal; but in the present instance the mucous membrane was in an inflamed condition, and was coated over with a layer of calcareous debris, so that I did not deem it advisable to sew up at once, fearing that if I did so the patient would suffer from chronic cystitis, with all its drawbacks and disasters. It will be observed that Nature's efforts went far to fill up the huge gap through which the stone was extracted, so that the operation for final closure of the wound was a small one indeed.

A word or two, now, in conclusion, upon the general treatment of stone in the female bladder. First, as to removal of stone after forcible dilatation of the urethra. Notwithstanding the careful limitation by Simon and others of the amount of dilatation to which the female urethra may be safely exposed, I find among my professional friends a melancholy looseness of opinion still prevalent. I showed this stone to a good many professional friends, and I was particularly struck by the large number of them who, thoughtlessly, I daresay, yet with undoubted sincerity, asked me whether I had removed it by dilating the urethra. Now, I would wish to emphasize the fact that, though the female urethra is largely dilatable, yet it cannot be dilated beyond a certain tolerably well defined amount without landing the patient in incontinence of urine for life. The amount to which the urethra can be dilated with safety is given by Simon (a). For an

(a) Read before the Obstetrical Society of Edinburgh.

(a) Volkmann's "Sammlung Klinischer Vorträge," No. 88.

adult woman a circumference of 6 to 6.25 cms., or 2 3-8ths to 2 7-16ths inches, corresponding to a diameter of 1 9 to 2 cms., or three-quarters of an inch nearly. For a young woman from 15 to 20 years, a circumference of 5.6 to 6.3 cms., or 2 3-16ths to 2 7-16ths inches; corresponding to a diameter of 1.8 to 2 cms., or barely three-quarters of an inch. For girls from 11 to 15 years of age, the highest degree of safe dilatation is, on the same authority, a circumference of 4.7 to 5.6 cms., or 1 7-8ths to 2 1-8th inch, corresponding to a diameter of 1.5 to 1.8 cms., or 9-16ths to 11-16ths of an inch nearly.

These observations agree with those made by Dr. Alexander Ogston (a), Dr. Emmet, and a host of other observers. Indeed, as an average indication it may with safety be stated that the urethra of an adult woman will allow of dilatation, provided it is carefully conducted, to the extent of passing the index finger, or to something decidedly less than an inch in diameter; but that anything beyond that amount is liable to land the patient in persistent incontinence of urine. The experience of authors in regard to the proportions of dilated cases which become sufferers from incontinence is very various. Emmet found this sequel in two out of eleven cases; while Noggerath had only two in seventy-five, or 2.66 per cent. Ogston (*op. cit.*) records a case of persistent incontinence in his own practice, in which he had removed through the dilated urethra a stone, whose smallest diameter was an inch; and he also refers to two other similar cases, one of which occurred in the practice of Dr. Davidson, of Warrle, in which the smallest diameter of the stone was 1 1/4 inch; and another in the practice of Dr. Paterson, of Inverury, in which the smallest diameter was 1 3-10ths inch. The cause of the incontinence from over-dilatation is somewhat difficult to establish. It would appear, from cases recorded, that the urethra will admit of much laceration without permanent incontinence ensuing, so long as the tear passes in the direction of its length. But that if the rupture passes across that direction, then comparatively a small amount of injury will be followed by incontinence, because the cicatrix thus arising prevents the mutual adaptation of the urethral folds at the neck of the bladder, by which, rather than by any sphincteric arrangement which the urethra possesses, the woman is enabled normally to retain her water.

If this be true, and the view is strongly urged by Emmet, it follows that urethral dilatation contains an element of uncertainty, sufficient to make us all very careful in having recourse to it, whether with the view of improving a cystitis, for the removal of foreign bodies from the bladder, or for establishing a doubtful diagnosis. At the same time, it is perfectly clear, from the results obtained by Lane (b) Emmet, Noggerath, and Dr. Alex. Ogston, that the original limit of Simon, viz., a diameter of 3/4 of an inch in an adult woman cannot be greatly exceeded without leading to disaster, whilst from accidental causes in regard to the direction of tear, in may even happen that less dilatation may be followed by troublesome incontinence. It is fortunate that we possess in the index finger an instrument at once the most suitable for effecting dilatation of the urethra, and a guide to that amount which is usually practicable within the limits of safety.

Most authorities who have performed this operation frequently, are, I think, satisfied that rapid dilatation under anæsthesia, first with the little finger guided on a sound, and then with the index, is preferable to all other measures, whether with tent, or with dilatating instrument, in order to secure safe and rapid dilatation. I have kept no record of the number of times, but I am safe to say

that I have for therapeutical or other purposes, performed this operation more than twenty times, and I am glad to say I never yet met with other than temporary incontinence.

VESICO-VAGINAL SECTION.

This operation in the adult woman is so easily performed that it ought to exclude all other methods, not excepting dilatation of the urethra, except in those cases in which the stone is small enough to pass the urethra without requiring it to be distended beyond a diameter of 3/4 of an inch, and in those very rare cases, where the stone is too large to pass through the vagina, when the suprapubic operation is necessitated. Lithotripsy comes in as a fair competitor for vesico-vaginal lithotomy, and will be preferred or rejected very much, according to the faith which the operator possesses in his own skill in conducting the operation, and the view he holds of the operation of vesico-vaginal fistula. Most gynecologists have much greater experience of vesico-vaginal fistula than of stone, and knowing the ease with which the vesico-vaginal wound may be closed, and the nearly complete absence of risk attaching to vesico-vaginal lithotomy, will be inclined, I think, with me, to prefer the latter operation to lithotripsy. Pure surgeons, on the other hand, confident in their skill as lithotritists, may be expected to prefer lithotripsy to vaginal lithotomy.

In performing the operation of vesico-vaginal lithotomy, the patient may be either placed in the lithotomy, or in the semi-prone position.

The only essential precautions needed, are to make sure that the incision shall be made in the mesial line, so as to avoid injury to the ureters, and not to commence the incision too near the neck of the bladder, in case we should thereby injure the retentive power of the organ.

I adopted, in the present instance, the method of Emmet, which consists in clipping down, with the stroke of a scissors upon the point of a uterine sound, made to project the bladder and vaginal wall a little behind the neck, and then to continue the opening thus effected, directly backwards, by means of a probe-pointed straight scissors.

This method has the disadvantage that it clips away a small portion of the mucous membrane of the base of the bladder, and in that respect, to some extent, interferes with healing afterwards.

Accordingly, I cannot help thinking it would be preferable to cut down, with the point of a knife, upon a grooved sound, and afterwards to enlarge the opening with scissors, as Dr. Emmet recommends. The opening is brought together with silver sutures, provided the mucous membrane is healthy. But if, as in our case, we have cystitis, the best means of curing the cystitis is the rest and cleanliness afforded by the patent fistula. Nothing could have been more satisfactory than the results in our case, both in relieving the patient from pain, and restoring the mucous membrane of the bladder to a healthy condition.

In some of these cases the opening through which the stone passes will be found to close of itself. In all of them it will greatly contract, but in most of them a subsequent operation will be required to complete closure.

The ease with which a vesico-vaginal wound can be closed up has led to great simplification of vesico-vaginal lithotomy, which was wont to be looked upon with terror, in consequence of the fistulae that were found to follow it. Even in bygone days, however, a certain proportion of such cases were found to spontaneously heal. Thanks to the labours and genius of Dr. Marion Sims, a vesico-vaginal fistula, except when associated with much destruction of the bladder and vaginal tissue, really gives us no concern.

LATERAL OPERATION FOR LITHOTOMY.

3. This operation, which appears in modern times, at least, to have been introduced by Dr. Andrew Buchanan (a), of Glasgow, where it was successfully performed by

(a) *Edinburgh Medical Journal*, July, 1879, p. 27. By a slip of the pen Dr. Ogston misquotes Simon in his above valuable paper, by giving the diameter of 11-16ths of an inch as applicable to girls from 5 to 11 years, instead of, as Simon has it, from 11 to 15 years—a sufficiently important difference; for to dilate the urethra of a girl of five to a diameter of 11-16ths of an inch would certainly be disastrous.

(b) *Lithotomy in the Female*. *Lancet*, 1863. Pp. 36 and 57.

(a) *Lancet*, Jan. 1863. P. 68.

him in six cases, and where, also, it has been successfully performed by Dr. George Buchanan (a) and Dr. Morton, consists in cutting into the left labium minor, and carrying the incision, which commences about half-an-inch above the meatus urinarius, downwards and backwards, parallel to the left pubic ramus. Before commencing the incision, a grooved staff is first passed into the bladder, and this is employed as a guide for conducting the deep incision. The knife is made to enter the groove of the staff as near as practicable to the point where the bladder and urethra meet. The incision is then continued downwards into the bladder, till it admits of seizure, and removal of the stone. It will thus be seen that the operation is very much similar to that of lithotomy in the male. This operation leaves the vagina intact, and is suitable in the case of young girls, in whom vesico-vaginal lithotomy is impracticable.

4. The vestibular operation, and the operation for dividing the urethra, either from behind forwards, or from before backwards, may be dismissed as possessing now-a-days only an historical interest.

5. Lithotripsy is more easily performed in the female than in the male, and appears very suitable for the case of stones, that are soft, and not too large. The recent improvements in this operation promise to make it still more suitable for the female. It presents nothing very special in its execution from the operation in the male. The main objection to its performance is the great danger of finding a nucleus that would give trouble as in the present instance. Suppose, in this case, the stone had been crushed, the hair-pin, twisted most likely and disfigured, would have landed us in a state of matters that could only have been treated by vagino-vesical lithotomy after all, with the addition of extreme risk of tear, or other injury of the bladder.

SUPRA-PUBIC OPERATION.

6. I need only state that this operation is only warranted when the stone is so large that it cannot pass through the vagina, and that, though it is a dangerous operation, the use of Listerian precautions robs it of much of its danger.

THE URINE OF CARDIAC DROPSY.

By J. MILNER FOTHERGILL, M.D.

Senior Assistant Physician to the City of London Hospital for Diseases of the Chest.

There are few more instructive matters clinically, physiologically, and therapeutically, than the alterations in the renal secretion in cardiac dropsy. First of all, there is the question of its bulk. It is scanty, high-coloured, and of high specific gravity. What has the colour to do with the bulk? Only this; that practically a pale urine, except when it contains sugar, is never of very high specific gravity. The secretion of urine solids and of pigment are not the same thing; but they run closely together, so closely, indeed, that for all practical purposes an inspection of the urine will tell its condition exactly enough; if necessary, the sense of smell may be used to corroborate the information afforded to the eye. It is scanty in bulk—that is the main point to notice about it. It is a concentrated urine, in fact. Then, further, it usually contains a quantity of lithates, sometimes of fawn colour, but more frequently like brick-dust, sometimes intensely red. Such is the character of the urine in mounting dropsy. When under treatment the bulk of the urine increases, which it will in favourable cases and under appropriate treatment, then the urine returns to the normal condition, or approaches thereto. It is increased in bulk, and is less intense in colour, and of a lower specific gravity; while the sediment disappears.

Now, as regards the bulk of urine: This is a very important matter clinically, yet not sufficiently insisted on as it ought to be. Speaking broadly, the bulk of urine is proportionate to the tension in the arteries. When the radial artery is slack and compressible the renal secretion is

scanty; when the radial artery is tense and incompressible then the bulk of urine is larger, unless there be some obstruction to the flow in the kidney itself. This relation of bulk of urine to arterial tension should be made a distinct matter in clinical teaching. In fevers, where the pressure within the artery is low, the bulk of urine is small, and its colour is high; there is, indeed, a concentrated urine. On the other hand, in an attack of hysteria the artery is tense, and the attack passes away with the voiding of a large quantity of limpid, pale urine—a dilute urine, indeed. Then, in the middle stage of chronic Bright's disease, where there is a tense artery with a distinctly hypertrophied left ventricle, there is found a free secretion of urine, of low specific gravity and pale in colour. Indeed, here we have the very opposite state of urine to that found in dropsy of cardiac origin. The strong hypertrophied left ventricle and the tense artery furnish a dilute urine. When the heart fails and the artery is imperfectly filled, then the blood pressure within the arteries is low, and a scanty concentrated urine is the consequence. When the heart fails in the later stages of the cirrhotic or gouty kidney; or otherwise the gouty heart, according as we look at the case from the point of view of the kidney or the heart, the condition of an hypertrophied ventricle and high arterial tension in time merges into a failing heart and low arterial tension. The readiest evidence of this change in the internal morbid condition is the alteration in the urine: the dilute urine slowly passes into the concentrated urine.

The clinical acumen of Sir William Jenner first pointed out distinctly the grim significance of this alteration in the urine. It marks the progress of the case from the time when the features were those of the gouty heart and kidneys in an early stage, till they are lost in those characteristic of cardiac failure. Except that the hard walls of the artery tell of the atheroma which goes hand in hand with the hypertrophied heart and the high arterial tension, the aspect of a case of failing hypertrophy and of one of primary mitral disease is identical in its main features. When under the influence of cardiac tonics the heart regains somewhat of its vigour—the change in the urine is the first herald of improvement. Many men say, "I know the digitalis is doing good, when the bulk of urine increases under its administration." They are quite right as to the association; but not quite accurate as to their phraseology. It is because the digitalis is increasing the vigour of the cardiac contractions and thus the arteries are being filled with blood, that the bulk of urine is increased. Here the increase in the arterial tension is evidenced by an increase in the bulk of urine. When under a continuance of the treatment the bulk of urine once more drops, then it testifies that the heart wall is far decayed—the temporary improvement from the stimulus is passing away, never to be restored. This fall in the bulk of urine under treatment is most ominous, and tells that the case is moving into its final phases.

Along with this question of bulk is linked that of albuminuria. In the cirrhotic, or gouty kidney albumen is rarely found; it is fitful in appearance, and found usually only at long intervals. Then it is found more persistently; after a while a trace is only present. Then, as the heart fails, and the bulk of urine falls, the amount of albumen is greater. That is, when the veins are full, and the arteries are comparatively empty, the bulk of urine falls, there is, indeed, a concentrated urine. As the venous congestion becomes more pronounced, the quantity of albumen in the urine increases. A scanty urine, high-coloured, and containing albumen, marks the failure of the heart-walls. Under digitalis, or other cardiac tonic, the heart gains tone, the bulk of urine rises, and the albumen disappears, partly or altogether. When the bulk of urine falls, the treatment being continued, then albumen, the herald of evil, is once more found. It increases in quantity, and the prognosis of the case goes hand-in-hand with it. To put it tersely, the fall in the bulk of urine is the accompaniment of low arterial tension, of an imperfectly-filled artery; the albumen is the tall-tale index of venous fulness. The relations of the increase of the albumen with the decrease of the bulk of urine, are most important—clinically—whether in hospital or in private practice. Such albuminuria is strictly cardiac or venous, and is distinct from any appearance of albumen which pre-existed as the accompaniment of the mischief in the kidneys.

Then comes the question of the lithates, the deposit, or sediment in the urine. It is not to be taken for granted that

the deposit is wholly composed of uric acid, in combination with some base or basyle, soda or ammonia; but it is convenient to keep this well in the focus of vision. Any admixture of triple or other phosphates is practically immaterial. Lithates are usually found along with a concentrated urine, but not in the concentrated urine of severe exercise, or of free perspiration, however induced. They are the accompaniment of a concentrated urine, the result of disease, *par excellence*.

Lithates indicate imperfect oxidation of nitrogenised matters. Nitrogenised waste reaches its most complete oxidation in the form of urea. Less perfectly oxidised it is found as uric acid. The oxidation of albuminous bodies is one of the functions of the liver. When the liver is embarrassed then the oxidation of albuminoid substances is interfered with. In cardiac failure, whether due to primary valvular disease or to failure of once-existing hypertrophy, in connection with gouty kidneys, the liver is gorged with venous blood. This venous engorgement cripples the liver in its functions, and the imperfect oxidation of albuminoids is manifested by the presence of lithates in the urine. It is not that lithates are a necessary accompaniment of concentrated urine, as said before; but that the presence of lithates tells that venous congestion is crippling the liver in its capacity to burn the waste albuminoids. The lithates, like the albumen, tell of venous fulness. ("*Indigestion and Bilioussness.*")

Now, the presence of lithates is an important matter as regards the dietary of the patient. It is customary to feed the patient up under these circumstances. The strongest of beef-tea, calf's-foot jelly with sherry, or meat essence, or compressed meat juice. Certainly, the desire to feed the tissues, and to restore the tone of the heart is a most creditable one. But the question arises: How far is this crippled liver equal to the digestion of albuminoids? It is one thing to administer albuminoid food to a patient; it is another thing to aid interstitial nutrition—otherwise, to feed the tissues. Albuminoid food, which is not perfectly and completely digested, certainly does not, and cannot, feed the tissues. But it can add most distinctly to the amount of albuminoid waste to be got rid of. Now, it is not desirable to add to the latter.

How, then, should the patient be dieted? So as to give the maximum of tissue-nutrition with the minimum of nitrogenised waste; to feed the kidneys without overtaxing the oxidising powers of the liver and the excretory capacity of the kidneys; that is what is to be aimed at. When the liver is persistently engorged with venous blood from cardiac or pulmonary incapacity, as is well known, there is an increase of connective tissue throughout it. This, added to the venous fulness, further cripples it functionally. Less of the albuminoids taken as food are thoroughly digested. Consequently two things follow—(1) the tissues are imperfectly nourished, and (2) the blood is laden with waste nitrogenised material. This latter, by obstructing the flow of blood through the arterioles, adds to the work of the heart, increasing the opposition to be overcome on each ventricular contraction; consequently, when the amount of nitrogenous waste in the blood is reduced the opposition to be overcome is lessened, and the ventricle has more opportunities given for recovering itself. The less the amount of waste—in other words—the less the left ventricle has to do, the less work to perform; while, on the other hand, the more perfectly the food is digested, and the better the tissue-nutrition. Two great ends, then, are attained by dieting the patient in accordance with the enfeebled assimilative organs, for it must be borne in mind that not only are the liver and kidneys embarrassed by the venous fulness, and their functional activity impaired; but the venous fulness also affects the stomach, and lessens its functional capacity. Consequently it is well to place the patient on a milk dietary—completely in some cases, mainly in others. By so doing two great ends are achieved; the tissues are better nourished, including the heart, and there is less nitrogenised waste in the blood, thus lessening the work of the heart.

In the treatment of cardiac dropsy, then, the indications for treatment are—*a*, To increase the vigour of the cardiac contractions, by digitalis, or agent of allied properties; *b*, to lessen the venous fulness by cathartics, or free diaphoresis; and *c*, to so diet the patient as to secure the maximum of tissue-nutrition with the minimum of nitrogenised waste in the blood.

The International Medical Congress.

INTRODUCTORY ADDRESS ON MEDICINE.

Delivered by SIR WM. GULL, BART., M.D., D.C.L.,
LL.D., F.R.S.,

President of the Section.

GENTLEMEN, FRIENDS, AND COLLEAGUES.—I am deeply sensible of the honour conferred upon me in being called upon to preside over this Section, and I offer you my cordial thanks.

Happily the duties will not be arduous, since the general Addresses which have been arranged and admirably allotted relieve me of the responsibility of attempting to develop before you the actual position of medicine, or the probable lines of its future progress.

As the International Medical Congress assembles in England for the first time under the auspices of Queen Victoria, so I am reminded that three hundred years ago, under Queen Elizabeth, Bacon enunciated for the first time, in the simplest terms, the position of the student of Nature in relation to the work before him.

Prone as we mostly are to easy satisfaction on imperfect evidence, and to rest in the *experientia fallax*, it is something that we are all agreed in aim and means, and admit that there is but one source and test of knowledge, "the observation of the order of Nature." We have no principles, but facts; no eclecticism, but of these; and nothing touching the conditions of humanity is foreign to our consideration.

Anatomy, physiology, and pathology have an impersonal and scientific object. Their aim is wide and general. The facts with which they deal are subject to no deflection from affection. Great or small, they have all an equal value. Pathology even denies its name in the presence of that which is universal, merges into physiology, and sees that "whatever is, is right." But far otherwise is it with clinical medicine, where the welfare of the individual alone has to be considered. We call ourselves physicians, and cannot be too jealous of the title and of all that it includes; but we are *medici* or curers of disease. Hence, together with the highest duties which science imposes, there are the various personal claims of humanity, augmented by suffering and charged with every disturbing element that weighs upon the heart of man; but at the same time for us with every high and quickening motive. These are warring influences, and to correct them we have often with effort to bring our clinical questions into relation with that which is impersonal and above passion.

It is an agreeable fancy on these occasions to suppose that civilisation may have been differentiated into its various nationalities, less for the strife of war, than that each nation might contribute, according to its genius, to the progress of the sciences. It may be utopian to see it thus; yet a review of the past two or three centuries would suggest as much. That scientific congresses have met, and that they continue to meet, promise better things to come out of the social chaos, as the imagination realises organisation springing up amidst the strife of the elements in an early world.

To Italy and the South we owe the early development of anatomy. The illustrious names of Morgagni, Galvani, Scarpa, and others, many of whom have left their names for ever inscribed on our textures, bear early and continued witness of this. And although we Englishmen will ever be tenacious of vindicating for our Harvey the immortal honour of having first demonstrated the circulation of the blood, we equally admit that Italy was his teacher of anatomy. And no less did Italy lead the way in morbid anatomy, as testify the pages of Morgagni in his treatise "*De Causis et Sedibus Morborum.*"

To Germany and the North we are largely indebted for analytical progress. Their profound investigation in chemistry, and their exhaustive researches into minute anatomy and histology, have gone far to solve the problems of organic composition and organic structure. I will not support my position by citing illustrious names. Happily, many whom I should have to mention are still among us; but biological science will never forget Leeuwenhoek and

Ehrenberg, Berzelius, and Liebig, nor the labours of the modern schools.

France, with her rare synthetic faculty, seems specially gifted for promoting the science of physiology. I have but to recall the name of Bichat, and to point to the refined investigations of Bernard, and to those of his successors of to-day. And with France I may join Switzerland, whose Haller gave the earliest and strongest impulse to the study of the laws of living things, as a separate science; though, as in the case of Harvey, his lamp was lighted abroad in the famous school of Leyden.

The English genius is perhaps more fitted for the Historical method and its obvious lessons. But perhaps I ought not to say obvious, for not rarely have the English been satisfied with records without inferences. There are, however, splendid instances of both; of the one in the museum of Hunter, and of the other in the works of Darwin.

But here you will be ready to exclaim "Siste!" for who in the least acquainted with the progress of the biological sciences in different schools at the present time would venture to claim for either some special fitness over the rest for any line of pursuit, and when the spirit of each can say like Goethe's Natur-geist:—

"In Lebensfluthen, im Thatensturm
Wall ich auf und ab
Wehe hin und her!"

Some have prophesied that the advancement of the Biological Sciences will leave medicine a barren waste in their midst; but such a result, in the natural course of things, cannot happen. There is an indissoluble union between all the sciences which, for medicine especially, human interest will ever strengthen. The past history and the present state of our profession give us abundant assurance of this. It is not too much to assert that the study of medicine will for all time attract a large proportion of the best thinkers and workers of the world. It has ever been so; and what has been doubtless shall be in the time to come. Besides, almost every germ of scientific thought has sprung in some way from medicine; and I have only to remind you that some of the most illustrious physiologists and pathologists of to-day are members of our own profession. And if from the delicacy, intricacy, and the demands made upon all the powers of the intellect by the extent and character of their investigations, they have, as it were, turned aside from immediate clinical work, they are still so much in union with us, that we daily at the bedside avail ourselves of the results of their labours, and gratefully acknowledge that they are our ministering angels, ascending angels, ascending and descending upon the ladder of science in the furtherance of all good practice.

Clinical medicine, however, of itself, affords opportunities for the study of Pathology, which are in some respects at least unique. Through it, and through it alone, we become acquainted with the first deviations from normal function. From such early beginnings we may trace the development of pathological processes, until the organism is finally, and in different ways, overwhelmed by them. I need only suggest those chronic lesions which spring up from conditions *ab intra*. In the latter stages of these degenerative processes we are apt, without their history, to be so impressed with the more prominent mechanical results, that these would seem to us the original and essential conditions; as to the Nile-worshipper, the river is a power in itself.

It is well for the progress of clinical medicine that its lines of investigation are thus intimately interwoven with the more scientific departments. It saves us from the dangers of separatism, and our colleagues from those of pharisaism; and it quickens our observations where they might otherwise be thought insignificant. If we cannot weigh and measure the data before us, we may still advance the solution of some of the more difficult problems of our conditions by critical and exact records. How much has been done in this field of late, especially in cerebral physiology, need not now be told. Every fact to the clinical physician has its value, though it may be of a different order to the phenomena of gravitation. A tone of the voice, the play of the features, the outline and carriage of the body, are to him as invariably related to the central conditions which they reveal as are the grosser facts of nature.

The work of the next few days, so far as it is foreshadowed by the list of promised papers, will raise some important pathological questions. You will be asked to consider peripheral lesions, having their origin in nerve-centres—lesions which have, for the most part, been hitherto chiefly con-

sidered primarily humoral and chemical, but now referred to "trophic changes of nerve-origin." On this point it may not be uninteresting to notice how "Solidism" is widely re-asserting itself in the science of living things—not as an *a priori* system, but through the progress of our knowledge. The proximate conditions of pyrexia are no longer vaguely referred to nerve, but to definite nerve-centres; hyperæmia and inflammatory changes to sympathetic lesions; abnormal chemistry to the great respiratory centres; the strange conditions of Addison's disease, with its characteristic pigment, to the supra-renal bodies, themselves probably but nerve-centres, and related, at least by structure, to the system of the pituitary gland; epilepsy, supposed in Hippocratic times to be due to extraneous maleficent spiritual influence, is traceable to apparently trifling changes in a few grey nerve-cells. The specific fever-processes notoriously owe much of their character and intensity to the nervous system. Their relation to time, their occurrence only in warm-blooded animals, the great mortality they cause through nerve-exhaustion, and the immunity they leave behind them, indicate that, whatever may be the nature or mode of operation of their several poisons, it is by implication of nerve-elements that fever obtains its chief clinical characteristics.

Further, in the advance of "Solidism," what can interest us more than the recent investigation on contagion? Perhaps no more important step has been made in practical pathology than the proof that some at least of these contagia are organised solids. This discovery, which it has tried the patience, experimental skill, and scientific criticism of the best observers to establish, has brought us at length within view of that which has hitherto been so mysterious. To have been able to separate, though imperfectly, the contagious particles—to have come to the conclusion that no fever-poisons are soluble—is a hopeful preliminary towards forcing them to yield up the secret of their nature.

If "Solidism" as a theory of organic processes wanted confirmation, we could point to nothing more striking than the present established views on putrefactive changes, and to the amazing fact that the normal textures and fluids of the body resist decomposition, unless invaded by microscopic organisms.

May we not hereafter find that all organic chemistry is the resultant of mechanical changes in organic solids?—all Nature, in fact, as Newton asserted, but the Great First Cause. Of this we are admonished on all sides. Histology, physiology, pathology, clinical medicine, teach us more and more the supreme importance of *form* and *relation*.

Lesions extending from alteration of the blood vessels will also come under consideration. Of course the more common facts relating to aneurism and valvular disease, or such as are thrombotic or embolic, need not be discussed; but there is a contribution which raises the question how far primary, general arterial tension may be a starting point at least in renal pathology.

The etiology of typhoid fever will be raised at one of our meetings. This cannot but enforce a rigid criticism of the infective processes, and of the differences between the states of simple pyrexia, septicæmia, and the specific fevers.

The pathology and treatment of gout, rheumatoid arthritis, and rheumatism, to which, in one form or another, the English seem rather especially prone, will also come up for discussion. Whether they have humoral sources has of late become more and more doubtful.

Of the pathology of acute rheumatism we may be said to know but little beyond its clinical records and its symptoms; but, unhappily, this has not always been sufficiently recognised, and too often a dangerous polypharmacy has rushed into the cure where science has not yet advanced her foot.

The forms of renal diseases, for a long time included, with little exception, under the term, "Bright's Disease," will undergo a further degree of analysis. It was a happy omen of this when they moved from the singular into the plural form, "Bright's Diseases;" and we may hope now for a more methodical sub-division of them, making their clinical recognition more easy and their therapeutics more precise.

In the matter of diagnosis we have invited contributions on the pathonomic and diagnostic value of the localisation of disease in the brain and spinal cord, which will be an

occasion for a review of our knowledge of *cerebral* and *spinal mechanism*, and for further elucidating the pathology of the different conditions of blood, blood-vessels, and connective tissue concerned in the nutrition and diseases of these great nerve-centres. Brain-texture proper seems but little liable to primary disease. As the nervous lamina takes the lead in embryonic evolution, so it would seem that its equivalent in the adult maintain a degree of resistance to morbid change throughout life.

Time fails me to speak of all that we hope to undertake. Any one paragraph of our programme would more than consume the time at our disposal. It must not therefore be inferred that the importance attached to any one of the subjects is in proportion to the prominence given to it in this hasty review. The treatment of disease, for instance, is a subject too large and weighty to speak of in general terms. In some minor points it will come before us, as in a paper on the advantage of High Altitude in the Treatment of Pulmonary Phthisis.

An organisation such as our own, which it has taken countless ages to evolve, must reasonably require incalculable time for its scientific analysis; and the same may be said of the infinite and varying conditions by which it is maintained, and upon which its existence constantly and immediately depends. At best we know but a few proximate facts, yet these in judicious hands have afforded a good harvest of practical results: what better fruit we may gather when science has penetrated deeper into the laws of our being, and all that affects it, it is impossible to forecast.

In the spirit of the exhortation given by the President in his address to-day, and in the slightly altered words of Bacon, with whom I began, let me conclude by saying, "It were a Heaven upon earth to have the mind illumined by knowledge, to move in charity, and turn upon the poles of truth."

INTRODUCTORY ADDRESS ON SURGERY.

Delivered by JOHN ERIC ERICHSEN, F.R.S.,

Surgeon Extraordinary to Her Majesty the Queen, Emeritus Professor of Surgery in University College, President of the Surgical Section.

GENTLEMEN,—Surgery is never stationary. To be stationary while all around us is in movement would be practically to retrograde. But movement does not necessarily mean advance. The general direction of the movement may undoubtedly be forwards, but the factors of that movement do not all equally tend to progress. When the history of Surgery comes to be written,—and this has never yet been done,—it will be found that the surgery of the nineteenth century has not been uniform in its progress in all departments; that its advance has not been continuously in one line, but its progress has been materially affected by the prevailing bias of the professional mind of the day. Anatomical at one time, physiological at another the tendency of the surgery of the present day is influenced in one direction by the mechanical spirit of the age, and in another by the advanced Pathology which is one of its chief medical characteristics. Yet the continuous advance of our Art is undoubted. The gain that thus results has been definitely secured to surgery and to mankind. It can never be lost. Every conquest that has been made is permanent. Year after year some new position has been won, often, it is true, after a hot conflict of opinion; but once occupied it has never been abandoned. Thus our standpoint has ever been pushed on in advance. For knowledge in science is cumulative, to its stores each generation has added, and skill in art is a tradition that is hereditarily transmitted from master to pupil, if not by the individual, yet by the profession to which he belongs, from which he has acquired, and to which he bequeaths it, augmented and perfected by his own labour. With the knowledge of our predecessors we are familiar. What they have done has been transmitted to us, and we can readily accomplish. In what we can do we may be sure our successors will not fail.

It is well that from time to time this advance should be measured, this gain weighed. The business of this Section is not only to measure the extent of the advance, but to determine the value of the gain, and to do this, not so much by the novelty of the practice, or by the brilliancy of its exposition, as by an estimate of its intrinsic merit, as shown

by its proved utility. Our business here, has to do with practical considerations, having reference to the recent advances in, or the future lines to be followed by, modern surgery.

The executive of this Section has proposed eight subjects for the consideration of its members. It is hoped that these will be found to include the more important surgical questions that are at present most prominently before the profession. The short time at our disposal, which will scarcely enable us to do full justice even to these subjects, has prevented the possibility of our bringing forward other and perhaps equally interesting questions; but some of these will be found to have received consideration in the papers which will be read, either *in extenso* or in abstract, as time may allow.

I will now briefly refer to the more important subjects that have been set down for our consideration.

(1) In no department of surgery has a more marked or a more brilliant advance been made of late years than in that which concerns the operative treatment of Intra-Peritoneal Tumours.

The establishment of Ovariectomy as a recognised surgical operation has now long been a matter of history; but the perfection of safety to which it has of late years been carried, by the improvement of its details, has led the way to a vast and rapid extension of operative surgery for the cure or relief of various diseased abdominal organs. The uterus and the spleen, the stomach, the pylorus and the colon, have each and all been subjected to the scalpel of the surgeon; with what success has yet to be determined; and it is for you to decide whether some, at least, of these operations constitute real and solid advances in our Art, or whether they are rather to be regarded as bold and skilful experiments on the endurance and reparative power of the human frame—whether in fact they are surgical triumphs or operative audacities. There must, indeed be a limit to the progress of operative surgery in this direction. Are we at present in a position to define it? There cannot always be new fields for conquest by the knife; there must be portions of the human frame that will ever remain sacred from its intrusion, at least, in the hands of the surgeon. May there not be some reason to fear lest the very perfection to which ovariectomy has been carried may lead to an over-sanguine expectation of the value and the safety of the abdominal section, and exploration when applied to the diagnosis or cure of diseases of other and very dissimilar organs, in which but little of ultimate advantage, and certainly much of immediate peril, may be expected from operative interference?

(2) In the discussion of the next great question, I would submit that we may, with advantage, direct our attention less to the mere mechanical—the simple operative part of the business, the details of which are now well understood, than to the consideration of those higher questions as to the diagnosis and nature of the various forms of renal disease, in which Nephrotomy and Nephrectomy may be respectively used, with a reasonable hope of relief or cure. And in considering the prospects afforded by these operations in the improvement of the health and the mitigation of the sufferings of the patient, it is surely not the least interesting point for us to study the after-physiological effects produced on the system by the extirpation of so important an eliminatory organ as the kidney.

(3) We naturally pass from the consideration of operations on the kidney to that of those which implicate the bladder; and in doing so we have specially to direct our attention to the question as to what advances have of late been made in Lithotomy and Lithotripsy.

In Lithotomy we see much of change, possibly something of novelty, but not so certainly anything of real progress. Have we indeed advanced one single step either in the perfection or in the results of that operation since the days of Cheselden, of Martineau, or of Crosse, not to mention the names of more recent but equally illustrious surgeons and successful operators? The revived median, the combination of it with Lithotripsy, the supra-pubic, whether done antiseptically or not, have certainly not been very encouraging in their results, and can scarcely claim to be considered in the light of an advance on the old lateral operation in skilful hands.

But yet we must admit that these methods of Lithotomy may deserve this consideration—that possibly in some forms of calculus, and in certain conditions of the urinary organs, a wise eclecticism may be exercised in the choice of one or other of them.

In Lithotrity, however, it is probable that a great and real advance has been made, and certainly it is undoubted that a complete revolution has been effected by the enterprise and skill of one of our American brethren, for it cannot be questioned that "Bigelow's operation" has completely changed the aspect of Lithotrity, and there is every reason to believe that it constitutes one of those real advances in a method which marks an epoch not only in the history of the operation itself, but in the treatment of the disease to which it is applicable.

But here a fertile field opens up for our deliberation. We have to consider not only in what cases, as regards the mere size of calculus, "Bigelow's operation" may safely be used; but also, and far more important than this, the ultimate result both upon the bladder and the kidney of prolonged intra-vesical instrumentation. The mere question as to the comparative advantages of removal of stone by one or by several sittings, is dwarfed by the more important one of determining the state of the bladder that results, not perhaps so much as concerns the life as the future comfort of the patient. It is here that information is much needed, and it is here that unfortunately, but for very obvious reasons, the lithotrist himself may in many cases be unable to furnish it.

(4) Pre-historic man was, doubtless, a victim of injury before he became the sufferer from disease, and the treatment of wounds constituted probably the first effort of the healing art. From the earliest dawn of human intelligence the attempt to cure a wound must have suggested itself to man, and yet at the close of the nineteenth century we are still discussing the best methods of doing this, and the causes of their failure. There is still difference of opinion and of practice amongst surgeons, not only as to the comparative advantages of the "open air" method, and that in which all atmospheric contact, is carefully guarded against; of the "dry" and of the "moist" system of dressing; as to whether the "antiseptic method" in a modified form suffices, or whether the more elaborate system of local treatment before, during, after an operation, which has been devised by the skill and worked out by the unwearied labour of Lister, be essential in all cases of operation wound. Not, of course, for its primary union—for this may be obtained by any and every of the methods mentioned. If it be contended that this system is necessary for the safety of the patient, and the due healing of the wound in some cases, has it been proved to be equally essential in traumatic lesions of all tissues, of all organs, and of all regions? These are questions that may well deserve the consideration of this Section. But there are others of a yet wider character that must also engage our attention in any discussion on the best methods of securing primary union in wounds, for it is impossible to fail to recognise in the general constitutional state of the patient, a most important factor in this direction; and we should be taking a narrow view of this many-sided question if we did not give due weight to the influence of those hygienic conditions which, if faulty are inimical, or even destructive to, the due performance of those actions which are necessary for the maintenance of the organism in a healthy state, and for the proper nutrition and consequent repair of the tissues of the body. Is there no fear that in some of the modern systems of treating wounds we are in danger of expending all our precautions in the prevention of the local and of ignoring the risk of a constitutional infection?

(5) The treatment of Aneurism is one of those great questions which, from an early period in the history of modern surgery, has occupied the attention of practitioners, and has undergone no little fluctuation. A few years ago the battle between the ligature and compression appeared to have been decided in favour of the latter; but the invention of improved ligatures, made of various kinds of animal tissue, and applied with antiseptic precautions, has once more inclined the balance of professional opinion towards the Hunterian operation. But now again the practice of compression has received renewed strength from the employment of Es-march's elastic bandage in the cure of certain forms of external aneurism, and it is for you to determine in what cases it can be used with advantage, and in what way a cure is effected by its means. For in the treatment of aneurisms, as in that of so many other surgical diseases, the wiser and more scientific course is to follow a judicious system of selection in the method to be employed in each particular case, rather than to subject all to one unbending line of practice.

(6) The treatment by Re-section of some forms of chronic

and otherwise incurable joint diseases, has in certain articulations, and at suitable ages, met with the universal approbation of surgeons, and the wide extension of the principles of "conservative surgery," is one of the most striking evidences of advance in our art in modern times. Re-section has, however, of late years come to be extensively applied to the treatment of cases of articular disease which formerly were subjected to procedures of a less heroic character; and it will be for the members of this Section to weigh carefully the wisdom of such a measure, and to contrast its results, both as regards life of patient and after utility of limb, with those which may be obtained from the employment of milder means, such as absolute immobility with extension, and, possibly, in some cases, simple incision of the articulation.

(7) In considering the relations between Adenoma, Sarcoma, and Carcinoma in the mammary gland of the female, I would venture to submit that this subject has to be discussed here from its clinical rather than from its pathological side. We have here less to do with the ultimate structure of the tumours, with their histological affinities, with the parts that are played by epiblasts and mesoblasts, with what epithelium or connective tissue cells can or cannot do, than with their clinical history, their differential diagnosis in their earlier stages, the best time for their removal by operation, and the possibility in recurrence of the substitution of one form of disease for another. With these, and such questions as these, we, as clinical surgeons, may advantageously occupy ourselves.

(8) The last subject set down for discussion is one that has practical bearings of an importance that cannot be over-estimated. There are few questions of the present day of deeper surgical or social interest than the far-reaching, the apparently illimitable, and most pernicious, extension of a syphilitic contamination of organs and of tissues; of the modifications impressed by it on other diseases that are the local developments of diatheses, whether strumous, tubercular, rheumatic, or gouty. Does the diathesis exercise any influence upon the form assumed by the syphilitic disease, and to what extent does it modify the characters presented by it in its primary and its secondary affections, more especially when the latter manifest themselves upon the skin or in the bones; how far are gummata and caries, psoriasis, and rupia the consequences of a constitutional impress, influencing the direction of the syphilitic poison? To what extent may rickets and grey granulations be the ultimate products of the syphilitic taint? These and various other questions will probably occupy the attention of those who enter on the discussion of this wide-spreading subject.

We hope to be able to take the discussion of two questions on each day, so as to work through the eight in the time allotted to us. In addition to these there are various detached papers on subjects which are of much interest, but which scarcely admit of being classified under one or other of the above heads of discussion. These we shall take up as time and opportunity admit, but their number is so great that it is to be feared that full justice can scarcely be done to all, and that it will be unavoidable, on account of the limited time at our disposal, that a large number be read in abstract.

INTRODUCTORY ADDRESS ON OBSTETRICS.

Delivered by ALFRED H. MCCLINTOCK, M. D., LL.D., &c.,
President of the Obstetrical Section.

IN opening the obstetric section of this seventh International Medical Congress, the first and most gratifying duty that devolves upon your President, is to offer an earnest and hearty welcome to those obstetric members who have come from other nationalities, and from distant British colonies, to take part in this—the largest convention of medical men that has ever, perhaps, assembled together at any one time or place.

I present this cordial salutation, not only on the part of the officers and council of the particular section over which I have the honour to preside, but also on the part of the ob-gynecians and gynecologists of England, Scotland, and Ireland.

We are proud and happy to meet here on British ground so many of our brethren from various parts of the civilised world, but especially from Germany, France, and America, and to accord them a friendly greeting, not only out of respect for their individual merits and high reputation, but as repre-

sending those great obstetric schools over which the names of Mauriceau, Levret, Bandillocque, and Dubois; of Roederer, Siebold, Nagelé, Kiwisch, and Scanzoni; and of Bard, Dewees, Meigs, and Hodge, have severally shed such imperishable lustre!

Not the least of the important objects contemplated in this Congress, is the interchange of friendly feelings among its members. I am fully persuaded that our reunions will be attended, not alone with benefit to us all by the attrition of mind with mind,—but that new friendships will be formed, and old friendships confirmed, and that sentiments of mutual respect and regard will be developed, so as to strengthen the bond of brotherhood which should unite us as fellow-workers in the same department of medicine.

Allow me before going further, to express my deep sense of the unexpected, unmerited dignity which the Congress has conferred by putting me into the position of President of this most important Section; I feel it to be the highest and most flattering honour of my long professional life. Such a compliment more than repays one for forty years of labour and devotion; for it sets the seal of approval by contemporaries on my past life, and leaves nothing further or higher to aspire to in the way of professional distinction. At the same time, gentleman, this feeling of just pride and exaltation is mingled with a very poignant sense of incapacity, and I might well shrink from the responsibility of the post, but that in the discharge of its duties, I shall have the aid and co-operation of such accomplished men as those who constitute the Vice-Presidents and council of the section; they in truth are the giants on whose shoulders I am raised to the exalted position it is my good fortune to occupy in this Congress.

Inasmuch as this is the first occasion of the International Medical Congress meeting in London, it may not be inappropriate if I pass in review some of the more prominent among the many eminent obstetricians who lived and practised in this city, who, by their writings, teaching and discoveries, have contributed in no small measure to the development of midwifery and gynaecology, as well as to the medico-surgical fame of London.

I must, however, study brevity, being desirous, if possible, to keep within the fifteen minutes allowed for the readings of communications, so as to set an example of obedience to the rules of the Congress.

In this retrospective glance, I find only one name standing out in the sixteenth century:—Thomas Raynald, the translator of Eucarius Rhodion's celebrated treatise "*De partu Hominis*." The original English edition, by Raynald, appeared about 1540, and was the first distinct treatise on Midwifery in the English language, and for over a hundred years was the sole guide and text book of obstetric practitioners, male and female.

In the early part of the seventeenth century, the immortal William Harvey (*tanto nomini nullum par eulogium*) stands forth conspicuous, the splendour of his fame increasing as years roll on. He spent most of his time here, being physician to the King; and he delivered courses of lectures at the Royal College of Physicians, on anatomy and surgery. As a practitioner we know from the testimony of his contemporaries that Harvey excelled in midwifery, and in the treatment of female diseases.

Before the publication of his celebrated exertations, on generation, parturition, conception, &c., there were, according to Dr. Aveling, "but three works on midwifery in our language; these were translations from Rhodion, Rueff, and Guillemeau. His was the first book on Midwifery written by an Englishman, printed in our own language, and the influence which it had upon the practice of the time would with difficulty now be estimated. His claim therefore to eminence in our department of Medicine is beyond question." With this conviction on our minds, we shall the more heartily yield our applause when his magnificent memorial statue is unveiled at Folkestone, the place of his nativity, on Saturday next—a ceremony I may remark, which has with good taste and judgment been purposely so arranged that this great Medical Congress may take a part in showing honour and respect to the memory of one of the greatest discoverers in the science of medicine, and, consequently, one of the greatest benefactors to the human race.

Contemporary with Harvey was another remarkable man—Peter Chamberlen—the inventor of the midwifery forceps, indisputably the most valuable instrument of the whole *armamentarium chirurgicum*. Unfortunately for him, however, the brilliancy of his reputation is obscured by the

unworthy selfish conduct which caused him to keep the instrument a secret for the aggrandisement of himself and family. He was father of Dr. Hugh Chamberlen, the translator into English of Mauriceau's works. There is a handsome monument to the memory of this Dr. Hugh Chamberlen in Westminster Abbey, erected by his patron and friend the Duke of Buckingham. No less than five generations of the Chamberlen family were eminent in the medical profession here; and Dr. Peter, who attained a great age, had been physician to five English sovereigns.

Towards the close of this seventeenth century, Richard Wiseman, "Sergeant Chirurgion" to Charles I., published his treatise on surgery, in which he gives an excellent description of pelvic abscesses, consequent on parturition. He thus anticipated Puzos' essay on the same disease, and put forward much more rational and correct views as to its pathology.

The eighteenth century was destined to see a marvellous development of midwifery, as well as of many other arts and sciences. As might therefore be expected, London can boast of several eminent obstetricians at this period.

In chronological order, the first to be mentioned is Dr. John Arbuthnot, F.R.S., and F.R.C.P., physician to Queen Anne. Although he has left no enduring evidence of obstetric superiority, yet he was an eminent accoucheur in his day, and reflected infinite credit on our order by his rare literary talents, his deep scholarship, and his exalted social position. He was skilled in everything that related to science, and held a prominent place among the ablest writers and wits of that Augustan age; one of whom (Swift or Pope) Alludes in his poetry to

"Arbuthnot's soft obstetric hand."

A man who was considered a friend and an equal by Parnell, Gay, Bolingbroke, Swift, and Pope, could not fail to adorn any pursuit to which he devoted his vast intellectual powers. Speaking of him, Swift said, "He has more wit than we all, and his humanity is equal to his wit." A higher tribute could not have been paid him.

The next to be mentioned is Dr. John Maubray, not on account of any peculiar merit in either of his works—"The Female Physician," and "Midwifery brought to perfection,"—but because he is reputed to have been the first public teacher of midwifery in this country. He lectured, Dr. Denman tells us, at his house in Bond Street, so far back as the year 1724.

Nearly contemporary with Maubray was Dr. Edmund Chapman. He was the second public teacher of Midwifery in this city, and is entitled to our lasting gratitude for having been the first to publish to the world a description of that "noble instrument" (to use his own phrase), the obstetric forceps, the secret of which the Chamberlens kept to themselves for over fifty years. This he did in the "*Edinburgh Medical Essays*," and subsequently in his treatise "*On the Improvement of Midwifery chiefly with regard to the Operation*;" the operation meaning the application of the forceps. The first edition of this book came out in 1733.

About this same period also lived Sir Richard Manningham, F.R.S., a man of considerable learning and of great reputation as a successful midwifery practitioner. He was author of some obstetric works of temporary consequence, and his claim to remembrance arises from the circumstance that in the year 1739, he opened a ward in the Parochial Infirmary of St. James', Westminster, exclusively for the reception of parturient women, which was the first thing of the kind in Great Britain. Shortly afterwards the idea was taken up and enlarged upon elsewhere, and the great Lying-in Hospital of Dublin was founded by Dr. Bartholomew Mosse; being the first hospital of the kind in the British Dominions.

The very same year that Sir Richard Manningham opened his obstetric ward in St. James' Infirmary, as we have just seen, a surgeon from a small country town in Scotland established himself here in London as an accoucheur, who ultimately affected the greatest reformation that had yet taken place in the principles and practice of obstetrics. This man was William Smellie, a name always to be respected wherever Midwifery is cultivated as a science. For twenty years Smellie practised and taught here; and published the first volume of his celebrated treatise in 1751, and his splendid anatomical plates in 1754. Amongst his pupils who later on became eminent in the same branch of medicine, were William Hunter, Denman, David McBride (of Dublin,) John George Roederer (subsequently Professor of Midwifery

at Gottingen), Dr. James Lloyd, of Boston, U.S., and Dr. William Shippen, afterwards Professor of Midwifery, in the Pennsylvania University: this last being, according to Professor Parvin, "the two first American obstetric practitioners." Most gladly would I linger over the life and works of this great man, but I must content myself with a few sentences.

Smellie possessed a wonderful capacity for work, and a clear judgment; but beyond and above this he was endowed with a singularly accurate perception of facts, which made him a correct as well as a close observer of Nature. Herein lay the secret of his unrivalled success as a reformer and improver of midwifery. He himself felt this to be so, for in reviewing his practice, he says, "I diligently attended to the course and operations of Nature which occurred in my practice, regulating and improving myself by that infallible standard." (Case 186 Sydenham Society Edition). Truly, he was, in the words of Dr. Hugh Miller, a "noble character and an example of earnest living."

A couple of years after Smellie settled in London there came to live with him a young man from the Scottish county—Lanarkshire—of which Smellie himself was a native. This young man was no less a person than William Hunter—a name familiar to you all—whose plates and descriptions of the human gravid uterus have gained their author a foremost rank among obstetric writers. By his great reputation as a lecturer and as an anatomist, aided no doubt by his prepossessing appearance, polished manners, and cultivated mind, Hunter proved a successful competitor of Smellie's in practice. Like him, he also gave special courses of lectures on midwifery; MS. notes of which are to be found in many libraries. Dr. Matthews Duncan tells us the College of Physicians possesses two pretty complete volumes of such notes.

In 1748, Hunter was appointed Surgeon and man mid-wife to Middlesex Hospital, and soon afterwards to the British Lying-in Hospital; for though the Physicians claim him as belonging to themselves, yet it cannot be disputed that Hunter was a Surgeon and member of the Corporation of Surgeons of this city.

Besides being a rival, he was in some respects a contrast to Smellie. The school of obstetrics founded by the latter, was not inaptly described by the late Tyler Smith, as the mechanical school, from the importance it attached to the resources of art in aiding parturition. Hunter, on the other hand, placed extraordinary reliance on the powers of nature, and trusted too much to tincture of time. Hence his followers have been designated the physiological school; and through the influence of his commanding authority, they formed a large section of the profession, and could boast some great names.

Although we may regard Hunter as one of ourselves, and appropriate much of the glory with which his name is invested—"yet it is necessary (as Dr. Duncan observes) with a view to justice to point out that his obstetrical fame is chiefly anatomical, and that his greatest claim on our admiration and gratitude arises from his anatomical work and influence" (Harveian address, 1876).

It is a just boast of the English School of Midwifery that what, in the truest and strictest sense, is "the most conservative of all the resources of our art," was first formally admitted a place among obstetric operations, in this city and about the year 1756. The recognition by the profession of the artificial induction of premature labour, was the outcome of a medical conference held at the time and place just mentioned. Who was the first, or most strenuous advocate of the operation at that conference, does not appear; but we do know that the first to put it in practice, was Dr. Macaulay, a midwifery practitioner of this city. It is natural and just, therefore, to identify his name with this most beneficent measure, and to accord him a prominent place among the many distinguished accoucheurs who lived and practised here.

One of the greatest ornaments of that physiological school of accoucheurs—founded we may say by William Hunter—was Thomas Denman, a man of remarkably sound judgment, great prudence, and of the highest moral integrity. Throughout half a century he lectured and practised in this city. His work, entitled "An Introduction to the Practice of Midwifery," is well known to most of you. It has many peculiar excellencies, but to my mind the chief is his classification of labour, which is at once comprehensive, pathological, and practical, and thereby serves the highest purposes of any system of classification.

Did time permit, I could multiply these brief sketches so as

to include many other London obstetricians who lived since the commencement of the present century, of less note, it is true, but yet men who stood far above mediocrity, and who, by their writings, their teachings, and their practice, materially aided the advancement of midwifery and gynecology. I must content myself, however, with a mere recital of their honoured names, viz.: John Clarke, Osborne, Leake, Bland, Merriman, Charles Clarke, Gooch, David Davis, Blundel, John Ramsbotham, Granville, Ashwell, Lever, Looock, Waller, Murphy, Tyler Smith, Oldham.

These men all lived so near our own times (at least, those of us who, like myself, have reached the grand climacteric), that the bare mention of their names, at once recalls the titles and natures of their respective contributions to the funded capital of our professional knowledge.

Of the living obstetric celebrities, who make this city the scene of their work and their influence, I purposely refrain from speaking:

"My thoughts are with the dead; with the n
I live in long past years,
Their virtues love, their faults condemn,
Partake their hopes and fears;
And from their lesson seek and find
Instruction with an humble mind."

SOUTHEY.

But, to a more worthy occupant of this chair at some future meeting of the Congress, after we have played our little parts in life's drama, I bequeath the grateful, pleasing task of supplementing the above list with the names of those eminent London obstetricians and gynecologists, whom to meet and to know, is assuredly the most gratifying of the many privileges connected with this great international gathering.

INTRODUCTORY ADDRESS ON PATHOLOGY.

Delivered by SAMUEL WILKS, M.D., F.R.S.,

Physician to Guy's Hospital; President of the Pathological Section.

I WELCOME all of you here to-day. But are we not already of one brotherhood? Has not a common bond long ago united us in one family? Although we may not have shaken hands, we have joined in spirit, or perhaps, some of us have even been in more direct communication by means of winged words. Amongst all the ties which link man and man together, some of the closest are those forged by science. A special scientific inquiry will find two minds closely akin, although separated by thousands of miles, nationalities, or tongues. In our own department of pathology it creates a thrill of satisfaction to feel that the study of some morbid process may have led some of us to the discovery that another investigator, of whose existence we had been hitherto ignorant, has his thoughts and occupation in perfect union with our own, and that although oceans and continents may separate us, our minds are both attuned to the same string. It is not surprising that the vast subject which more immediately occupies us can never cease to interest man in all its details, whilst he has a resting-place on this globe.

I would fain have inaugurated this Section with a general address, but have refrained from doing so, daring not to sacrifice to platitude our too precious time when so much practical work has to be accomplished.

I cannot, however, but occupy you a few moments in order to take a glance at the immensity of the subject before us, embracing questions as it does in which humanity will be for ever interested, viz.,—those referring to disease, decay, and death.

Our subject, in a word, is Pathology. Pathology has received various definitions, the most common being that which contrasts it with physiology; for as the latter is regarded as the science of healthy organic life, so the former has been held to be the science of the unhealthy or of the abnormal course of life contrasted with the normal. This division of vital action into normal and abnormal is true in a superficial sense, and might be made theoretically to stand as a definition, but it is by no means applicable to our practical science of pathology, nor can it be made of any value as an expression of diagnostic knowledge in treating the thousand ills of which flesh is heir to.

In the first place, it must be admitted that the changes

which occur in every organic structure, as years roll on, are to be regarded as normal, unless we take an imaginary or ideal standard of a being living in some former golden age, where nought was known but perpetual youth, and regard every departure from this as morbid. Although we do not frame such a picture to ourselves, but know that the various changes in the bones, the cartilages, the lungs, the brain and other parts which take place in age, are in harmony with the dictates of Nature, yet how often are we called upon to treat these as forms of disease? They are, however, no more unnatural or pathological than the sere and yellow leaf which falls from the oak in autumn.

If, however, these senile changes occur prematurely, they will then be abnormal, and may be strictly regarded as morbid. Herein is one form of a pathological condition with which we have to deal—a premature decay arising from the various causes which bring the organism to an end, either from their operating with unusual force or from some inherent weakness in the body, which is unable to moderate their action. Now, if all these potent influences, instead of driving the mechanism too quickly, and so bringing it prematurely to an end, concentrate their forces upon one organ only, that organ would become, in ordinary parlance, diseased; but the process there set up may be of exactly the same nature as time would otherwise have produced. In comparatively young persons, for instance, we meet with fibroid and fatty changes of the heart and vessels, distension of the air-cells, alterations in the structure of bones and joints, which resemble in every respect those which age would have ordinarily induced. Therefore, many of the conditions which we call disease seem nothing more than the result of the concentration on a particular organ of all those agencies which, under ordinary circumstances, bring about senile changes. These changes, therefore, although senile in character, are abnormal, and therefore may be rightly regarded as pathological.

The pathologist, therefore, cannot but regard the body in the first place in its physiological relations with its surroundings, and mark the alterations which time produces. The physiologist is aware that the production of force must be accompanied by loss elsewhere, seeing that gain and loss are equal, and, therefore, in observing organic life he must regard the destructive processes as well as the formative. Life seems to depend upon changes continually going on in relation with the atmosphere in which all living bodies are steeped. The burning of the fuel in oxygen supplies the forces necessary for living processes; we, therefore, although alive, are constantly being consumed. During so many years the body is undergoing combustion, or we might say, slow destruction, and this process occurs much more rapidly in some persons and in some animals than in others. Why one creature should live longer or burn out sooner than another is not clear; why, for example, should a dog be worn out in ten or twelve years, its limbs be stiff, its sight and hearing impaired, its intellect obtuse, and senile changes be discoverable in its brain and elsewhere, when a parrot may take a century for the production of the same destructive changes? Why tissues of the same composition should wear out in one animal after ten revolutions of the earth, when it takes a hundred revolutions to destroy similar ones in another, is by no means apparent. In man, if the destructive and reproductive changes are normally counter-balanced, the ordinary duration of life is reached. If the balance be not kept, the destructive agencies may be in the ascendancy, and life be shortened. If any of the ordinary surroundings which are always exerting their influences upon us as various kinds of air, food, moral and mental moods, be in any way noxious, they may in time tend to premature death, and if they should act in such a manner as to cause localised organic changes, we should style these changes disease. There can be little doubt that a large number of maladies in England, as gout, Bright's disease, &c., are induced by mere excesses or inequalities in a mode of life which is considered ordinarily correct. It ought to be one of our studies to consider the relations of the human race to the soil, and observe all the circumstances which centuries have induced to bring about this normal or healthy relation between them. We might then observe the effects of the concentration of some of the more untoward of the influences which ordinarily environ it, as well as inquire into the effects of transplantation into another country. It seems that all the usual surroundings of life in civilised society, acting in undue proportion or in a

more determined manner, induce a very large number of the diseases which we are called upon to treat.

In considering all these agencies working for what we call evil, and leading to destruction, we must not overlook an opposing law—that of reparation. Not only do we observe a production of living force in necessary association with a dissolution of material, but an ever-existing tendency towards the re-making of the injured tissues. We can scarcely think of a morbid change in the body which is not attended by another which has an opposite tendency. Every phthisical lung showing destruction of the tissue exhibits at the same time the attempt to limit the process and to save life by shutting off the escape of air from the lung, or sealing the ulcerated blood-vessels.

Then, again, in considering the definition of disease, after having observed how large a number of maladies are produced by the influences of all our ordinary surroundings, we have to recognise those external causes of an extraordinary or specific character which prey upon the human frame, and often bring its machinery to an end. Now, if these causes are obviously parasitic, we are not witnessing so much the case of disease as the spectacle of one animal preying upon another. As regards the parasite, it is pursuing its normal life history, and as regards the patient or the host, he is simply being destroyed; the difference in his mode of death from that which would result from the onslaught of a wild animal would consist merely in time. If a man fall a victim to the bite of a cobra, he is not said to die of disease; but the term is applicable if he die of glanders. There is this difference, however, in the latter case—the poison is not a natural one, even in the infecting animal. If, however, in these infectious diseases the morbid cause be an animal or vegetable organism, although microscopic, then we really have to deal with the operation of one living being acting upon another, and the so-called specific malady exhibits nothing more than the natural course of life of certain specific organisms. The term, disease, according to the definition, is here again scarcely applicable.

All these abnormalities of the human organism, under whatever conditions they may arise, suggest that as every branch of biological science is being studied in relation to the lower organisations, and according to the law of evolution, so must pathology become the subject of a large field of inquiry, and be made to embrace the diseases of all animal and vegetable life. The comparison of disease in man and animals may throw much light upon its nature, and it is remarkable that so few persons have been stimulated to the work, by considering the long controversy which has taken place as to the relation between vaccinia and variola, or hydrophobia and rabies. A true human pathology should have its basis in comparative pathology. Here lies a mine of wealth but little worked. As at the present time every structure and function of the human body is being studied in reference to its antecedents in the lower animals, so there can be no doubt that the various morbid changes to which it is liable, may be also profitably discussed in reference to similar actions in more simple forms of life. The truth of this has been clearly seen by philosophers who have had no special acquaintance with our department of science. Thus Buckle, in his "History of Civilisation in England," says: "The best Physiologists distinctly recognise that the basis of their science must include not only the animals below man, but also the entire vegetable kingdom, and that without this commanding survey of the whole realm of organic nature we cannot possibly understand even human physiology, still less general physiology. The Pathologists, on the other hand, are so much in arrear, that the diseases of the lower animals rarely form parts of their plan, while the diseases of plants are almost entirely neglected, although it is certain that until all these have been studied, and some steps taken to generalise them, every pathological condition will be eminently empirical on account of the narrowness of the field from which it is collected." This is almost as true now as when written several years ago; but we are pleased to think that our countryman Sir James Paget, has already removed this slur upon our scientific procedure by his lecture on "Elemental Pathology," in which he shows the importance of observing the resemblances between the changes in the various tissues of man and the vegetable world, and also the deductions to be drawn therefrom.

Again, if the specific diseases be due to organisms, and the hypothetical *contagium vivum* be a reality, it must be subject to the same laws as other organic matter; and if the doctrine

of evolution be true, it must have numerous relations with families of its own kind, and perhaps with others which are now obsolete. This idea has occupied the minds of several medical men in this country, and it will no doubt further fructify in their hands. (a)

A highly contagious disease prevailing in a particular locality may be exhibiting differentiation of some more simple, less virulent, and widely spread disorder. For example, a slightly contagious epidemic sore-throat might in course of time develop into a more virulent one until it culminated in diphtheria; and if this disease be due to an organism, the latter might have found a more genial soil for its development, or be altered by propagation and time, so that new properties might at last have been added to it. There may be a progressive development of infectiveness. Then, again, the doctrine of natural selection might obtain in the fact of some specific diseases remaining amongst us, while others have become obsolete. The same law, too, if allowed its full operation might tend still more than it does to the subjugation of many hereditary diseases; for as these appear in youth, and often cause death, they would fade away by a process of self-destruction. As regards the specific diseases, we see again how the most susceptible persons would be struck out by the poison and the least susceptible remain, so that the poison would be modified in its virulence. We witness this fact in the more moderate characters of the exanthemata in all civilised nations, in comparison with the more profound effects produced by them in nations where the disease had been hitherto unknown, as, for example, the fatality in the Pacific Islands of our comparatively mild British measles.

Besides the maladies which are induced by the evil influences of our ordinary surroundings, and those due to specific causes just named, there is a class of disease styled new growths, which take a very large share in adding to man's mortality. The advance made in our knowledge of these structures is very considerable, and is still rapidly progressing towards a determination of their origin and the discovery of their relation to the normal tissues. These investigations are assisting us in discarding some of our older notions regarding their constitutional and malignant nature, and proving that many are accidental in their origin, and therefore may possibly be averted.

In the brief remarks, we see how the simple definition of Pathology as a deviation from the healthy standard fails in its application, and how wide is the range of subjects included in its domain. What these are, you, gentlemen, are about to illustrate in the different subjects which you will bring before the section.

Clinical Records.

NORTH-EASTERN HOSPITAL FOR CHILDREN, HACKNEY.

Cases of Congenital Disease of the Heart.

Under the care of Dr. C. E. ARMAND SEMPLE.

CASE 1.—Louisa C., *æt.* 7, was admitted on September 8, 1880. Father healthy; mother had had rheumatic fever nine years before the present date, and still suffered from rheumatic joints; three other children apparently healthy. The mother stated that the child appeared to be healthy and strong at birth, it was only when two weeks old that she first noticed that its "breath was bad," and that it "panted for breath," and at this time it began to lose flesh and get thin. The child frequently turned blue, its face and hands were quite livid, so that the mother used to think that it was about to die. She had been under care at the out-patient department of the hospital, off and on, from six months to three years old, with cough, dyspnoea, and typical cyanosis, chillings of the finger ends, &c. The cardiac dulness was very extensive, reaching to the anterior border of the axilla. There was also a systolic murmur at the apex external to the nipple. At 3½ years in addition a rolling presystolic murmur was heard which was thought to indicate some subsequent

endocarditis (leading to mitral stenosis), and taken into consideration with the great dilatation of the left auricle and ventricle, and the previous regurgitation was probably secondary to the abnormal connection between the left and right cavities. For the last few years she had suffered from attacks of syncope with coldness, shiverings, nausea, and increasing lividity; however, she did not "actually faint." During the winter months she was always more or less blue, cold and "marbly," and suffering with attacks of shivering and shortness of breath.

On admission she was fairly well nourished, her growth somewhat stunted. There was no marked cyanosis, no lividity of face, mottled redness of cheeks which were plump, lips dark cherry red, no marked distension of the large veins of the neck, the small superficial veins enlarged, especially over the chest. The external surface of forearms and front of chest, back of hands and feet, were a little more deeply coloured than natural.

The feet were not noticeably cold; there was a slight amount of clubbing of the nails of the fingers, together with blueness; there was no distress of breathing, but she had a slight cough.

Chest.—Lower ribs were much everted, giving rise to a very deep groove at the level of the ensiform cartilage.

Heart.—Apex beat diffused over a large area, very distinct in 3rd interspace 2 inches external to the nipple in outer axillary line in the 6th interspace, and also to some extent in the 7th space between antero- and post-axillary borders. Area of dulness from 3rd cartilage above and outwards 2½ inches external to the nipple, almost to axillary border, but did not reach to the right border of the sternum. Over the pulmonary artery the 2nd sound was reduplicated, the first element of reduplication being marked by the loudest, and extending down the left border of the sternum. Over the ensiform cartilage was a rolling systolic murmur and reduplication also was heard here. At the apex a loud rushing systolic bruit was audible of quite different quality to that heard at the ensiform cartilage, and a fourth sound heard in addition to the reduplication. The reduplication being followed by another sound, in fact, a triplication. The systolic bruit was fully audible in the back. She was discharged on November 4, 1880, no untoward symptoms during her stay in the hospital being noted.

She was admitted again on December 15, 1880, in a low feeble condition, but the lividity had not increased; she was suffering from an acute attack of nephritis, presumably scarlatinal, although no history of any fever previously to admission could be obtained. The heart murmur did not now alter very much in character. She was again discharged on February 27, 1881, greatly improved.

CASE 2.—Oswald C., *æt.* 10; father healthy; one grandmother died of heart disease. Mother healthy, 7 other children, youngest, *æt.* 7, said to have had shortness of breath and palpitation of the heart, the rest healthy. The mother said that from birth he was a strong healthy child with a "lovely colour," colour in the centre of each cheek, and the lips cherry red. Said the lips turned bluish whenever he ran about or exerted himself, shortness of breath from 4 years old if he walked much. Two years previous to admission he was sent to school in Yorkshire, and in the first winter he complained of the cold, and his face was a little blue; the second winter his face became very blue and cold, and he was unable to walk on account of bad chilled feet. He returned home to London the next summer very blue and wasted, and his forehead quite black, scarcely recognisable by his mother, and for a time regained strength. The blueness somewhat disappeared, but the shortness of breath that he had had continued. On admission to the North-Eastern Hospital on Jan. 18th, 1881, he was a bright cheerful boy. Both his cheeks and nose were of a deep crimson blue colour, tongue coated with fur, an ulcer the size of a sixpence on the lower lip; fingers not clubbed, but the nails very rounded and filbert-shaped, and of the same colour; toes of a faint livid tint, crimson, mottling of extremities even when warm in bed.

(a) Dr. Airy, D. Throne, &c.

He does not complain of the cold weather; slight dyspnoea on exertion; chest well formed.

Heart.—Impulse very diffused over 3rd, 4th, 5th interspaces, from the nipple line to sternum, most distinct in 5th space, $\frac{1}{2}$ -inch external to sternum; over this area a distinct grating thrill was to be felt; the area of dulness normal; at apex a loud rolling systolic bruit; at the base an intense loud superficial rasping systolic bruit; very loud 2nd, 3rd, and 4th interspaces, and cartilages adjoining edge of sternum; no reduplication of the 2nd sound, which is obscured but traceable more to the left side of the chest, but still very audible in the axilla and back. Discharged on January 17th, 1881, somewhat improved; face less livid.

CASE 3.—Percy M., æt. 10; father healthy; mother died six months previously of heart disease. Up to three years of age nothing unusual was noticed about the child. He was about that time observed to be short of breath after walking or running; up to one month before admission he attended school in the city, walking there and back from his home in Bethnal Green every day; subsequently he became quite unable to walk that distance on account of his shortness of breath, and at last it was quite a labour to him to walk at all. He gradually became worse; before admission he suffered from pain in the left side of the chest, which he described to his father as "thumping;" no blueness of lips, &c., has ever been noticed; but he had a very high colour at times after coming home from school; there was no history of rheumatic or scarlet fever, or of any pains at the joints. On admission to the Children's Hospital, on April 30th, 1881, he was a remarkably well-nourished child, with a well-developed chest; there was no cyanosis nor congestion of the lips, face, &c.; nails a little rounded; no pains, and apparently in perfect health.

Heart.—Area of dulness above at upper border of 3rd rib, and extending almost horizontally outwards $\frac{3}{4}$ inch external, and across the angle downwards to apex, beat in 5th interspace external to nipple, not beyond left border of sternum; over the 3rd left costal cartilage was heard a very loud rasping systolic bruit, superficial and localised, but, nevertheless, feebly audible on left and in left supra-clavicular fossa. Pulsation in 2nd and 3rd interspaces, close to sternum very distinctly visible, and over this and the surrounding area a grating systolic thrill was to be felt. At the apex there was a soft systolic murmur, audible in the axilla of a different character to that at the base, longer and more booming; 2nd sound both at apex and base inaudible. Left the hospital June 18th, 1881.

Hospital, Physician to the Hospital for Diseases of the
Throat, &c.

(Continued from page 101.)

Saint Galmier.

THIS establishment is at Loire, in France. There are three or four sources, but the particular one we have examined is marked Source Nouvelle (*cachet or*). The

other waters are Source Badoit (green seal), Source André (blue seal), and Source Centrales (yellow seal). The Source Nouvelle contains—

Carbonate of magnesium and	}	...	34.00
Carbonate of calcium			
Bicarbonate of sodium...	18.66
Bicarbonate of potassium	4.23
Carbonate of strontium	8.49
Carbonate of iron	0.63
Carbonate of manganese, trace			
Sulphate of sodium	5.53
Sulphate of calcium	12.10
Chloride of sodium	15.12
Chloride of magnesium	3.10
Chloride of calcium	
Nitric acid	1.83
Phosphoric acid, trace			
Lithium, trace			
Silica	4.20
Total solids	107.89

Skeleton Analysis of $\frac{1}{2}$ pint (10 fluid ounces).

Total solids.	Antacids.	Salines.	Purgatives.
6 $\frac{1}{4}$	3 $\frac{1}{2}$ grs.	1 gr.	1 $\frac{1}{2}$ grs.

Although not a very strong water, St. Galmier is complicated in composition. It is strongly antacid in character, but chiefly owing to the magnesia and alkaline earths; it is therefore peculiar in this respect. It, however, contains a marked quantity of carbonates of the alkalies, and therefore gives a decided reaction after boiling with phenolphthalein. It is quite pure, and contains no nitrogenous organic matter, and is worthy of a place amongst the first-class table waters. The ingredients are very equally divided in character.

ROSBACH.

The Rosbach springs are situated at Rosbach, near Homburg. Prof. Wanklyn reports that he personally inspected these springs in the autumn of 1878. He states that "the spring from which the Company draws the water is covered with a metallic hood so as to catch the natural carbonic acid, which escapes along with the water, and with which the bottles are charged." This seems to be the favourite method adopted for charging the water with the natural gas by all similar companies, but we must confess to a surprise that no better and more scientific method has been adopted. It seems to us very like the system of letting the deer escape for the pleasure of recapturing him again. According to Prof. Wanklyn, the rate of flows of this spring is 27 litres per minute, equal to 18,000,000 full bottles in the year.

It is certainly a very extraordinary testimonial for the same authority to state as follows:—"It will be seen that the Rosbach waters may be taken daily, in considerable quantities, with perfect safety, WHICH CANNOT BE SAID OF ANY OTHER MINERAL WATER at present before the public." The capitals are not ours, but are so in the report. The extraordinary part of this sentence (the reader may take it

in either sense) is that we find Prof. Wanklyn's name to published reports of other table waters which speak of them in the most complimentary terms.

The only published analysis of this water is the one put forward by the Company. To issue such a meagre analysis is absurd, and if they wish to gain public confidence the proprietors will do well to produce a more detailed account of its composition. It contains, according to Prof. Wanklyn—

Chloride of sodium	Grains.
Carbonate of calcium	83.0
Carbonate of magnesium	25.7
				12.6
				121.3

Skeleton Analysis of Half-a pint (10 oz. fluid).

Solids.	Saltines.	Antacids.	Purgatives.
7½ grs.	5 grs.	2¼ grs.	—

We have no doubt that in a general and rough sense the above represents the composition of this water, but if it did so exactly it would not be necessary for the public to pay for such a water, as it could be so easily imitated, owing to its simplicity of composition. We have not the quantity or time for a thorough examination, having only one small bottle at our disposal, which we have devoted simply to the determination of the absence, or presence, of organic impurities. We find this water to be fairly pure in this respect. It gives no evidence of nitrogenous organic matter. But at the same time the examination was quite sufficient to show that it is much more complicated in composition than the simple formula given above. In fact, there are certain ingredients which *must* be present in a mineral water which are not given in the above analysis.

One of the peculiarities of the Rosbach spring is the comparative absence of sulphates. In the analysis given no sulphates are present; this, however, is not absolutely correct as regards the bottled water, which certainly contains sulphates, although in comparatively small quantities.

In the principal foreign cities the rates of mortality, according to the latest official weekly return, were in—Calcutta 22, Bombay 35, Madras 33; Paris 33; Brussels 25; Amsterdam 23, Rotterdam 22, The Hague 26; Copenhagen 22, Stockholm 20, Christiania 17; St. Petersburg 56; Berlin 47, Hamburg 25, Dresden 29, Breslau 54, Munich 31; Vienna 27; Prague 36; Buda-Pesth 36; Venice 24; Alexandria 41; Brooklyn 36, Philadelphia, 28, and Baltimore 44 per 1,000 of the various populations.

THE annual rates of mortality last week in the principal large towns of the United Kingdom were—Wolverhampton 12, Oldham 12, Plymouth 13, Edinburgh 14, Portsmouth 15, Dublin 17, Bristol 17, Sheffield 17, Norwich 17, Bradford 18, Salford 18, Brighton 19, Glasgow 19, Newcastle-on-Tyne 21, Manchester 22, Birmingham 23, Sunderland 24, London 27, Hull 28, Liverpool 29, Leeds 29, Nottingham 29, and Leicester 36 per 1,000 of the population.

WEDNESDAY, AUGUST 10, 1881.

THE INTERNATIONAL MEDICAL CONGRESS.

A GENERAL ACCOUNT OF THE PROCEEDINGS.

THE success which has attended the meetings and excursions in connection with the Congress, has been of a nature to justify the almost exaggerated expectations that have been formed in respect of it. We have been privileged to receive and to entertain a large number of men, eminent in other countries as physicians and surgeons, than have ever before been gathered into any one place. We have been enabled to hear and to associate with most of the men who, on the Continent and in America, have identified themselves with all that is great and glorious in the science and art of medicine; and though it has unfortunately occurred that some few whom it would have delighted us to honour, e.g., Billroth and Gross, have been prevented from witnessing the magnificent proportions to which the Congress has attained, yet the full assurance that they have been with us in the spirit, and shared by anticipation the advantages we have enjoyed in reality, takes from the disappointment created by their absence. We have, in a word, been partakers in, and contributors to, the most gigantic triumph or

jubilee that medicine has ever celebrated. And we cannot here omit to point the moral that is largely printed in the events by which the week just past will be for ever memorable. In it the position of medicine among the professions, its title to be ranked the noblest and most ennobling, has been most irrefutably established; and it has been most conclusively shown to the world that the medical man is indeed what the earnest advocate of his deserts has ever insisted on his claim to be considered as at least the equals of those who occupy a place among the ranks of other professions. No one, perhaps, who was present at the impressive gathering assembled in St. James's Hall to hear the telling address delivered by Sir James Paget, will ever forget the sensations produced in him by the obvious deference paid by the best and highest of our land to the representatives of the medical profession. The prevalent feeling among the multitude is, it must be admitted, one that we must seriously deprecate, and which has been mischievously stimulated by the utterances of slander-mongers in notoriety-hunting journals. The most effectual blow possible to be struck at the pernicious influence exerted by these detractors, has been delivered, and in the results that will follow from the seventh International Medical Congress, we shall find the surest proof of a reaction favourable to the interests and legitimate claims of medical men to the gratitude of the general public. As concerns the foreign visitors who have been present with us, we may be assured that the hospitality extended to them will be among the most grateful recollections they will retain of this occasion; and numerous though they have been, there is, we trust and believe, no one of them who has not, in one form or other, received most practical demonstration of the friendliness and brotherly feeling with which English scientific men regard the medical men of other countries. We cannot hope to give anything approaching to a detailed account of the festivities that formed so graceful a feature of the week, but in a few words we may be able to indicate their nature and extent. In a similar manner we will endeavour to sketch the direction and amount of the more serious labours accomplished at the sectional meetings, but of all that has taken place we must be permitted to declare that the utmost success attended the public and private efforts to promote the happiness, and stir the interest, of the body of members of the Congress.

The General Reception Committee were busily employed during the greater part of Monday and Tuesday in receiving and acknowledging the visitors, who, thus early, came in considerable numbers to record themselves as members of the Congress. The arduous nature of their special work is to be judged when the numbers of those who enrolled their names are understood; but, thanks to the almost ubiquitous presence of Mr. MacCormac, the most energetic and most urbane of secretaries-general, this not unimportant duty was perfectly and pleasantly accomplished. On the Wednesday the actual work of the Congress commenced with the delivery of Sir James Paget's address, and, as we have said, the direct share in the vast meeting at St. James's Hall taken by the Prince of Wales was an emphatic vindication of the dignity and status of the profession thus honoured by his actual presence. A lunch

was subsequently given by Sir James Paget to a number of foreign members, at which the Prince of Wales attended, as did he also at a dinner given in Willis's Rooms in the evening, by Sir Wm. Gull, to about one hundred visitors to the Congress. A very largely attended *conversazione* at South Kensington Museum the same evening closed the day's entertainments, all of which were successfully carried out.

THE STATE DINNER AT THE MANSION HOUSE.

THE very cordial and most generous welcome extended by the City of London to the Congress, was a circumstance, not only one of the most attractive incidents of the assembly for the pleasure it afforded to the members, but for the *prestige* which it gave to the Congress in the eyes of foreigners and the public. That this meeting of the profession should be, as it has been, actively supported by Royalty, and by the almost regal "pomp and circumstance" of the civic magnates of the greatest metropolis in the world is something of which the profession may be proud, even though they may consider these distinctions of less importance than the scientific achievements to which the Congress was devoted. If the Lord Mayor and Corporation of the City of London had not felt that medical men and medical affairs occupied a chief position in public affairs, they would certainly not have agreed to the lavish expenditure of money, thought, and energy which their entertainments involved. The banquet given by the Lord Mayor at the Mansion House was necessarily restricted, almost altogether, to the chief foreign, and extra-metropolitan visitors to the Congress, inasmuch as only 260 invitations could be distributed amongst 3,000 members.

It is hardly necessary for us to say that the banquet lacked nothing of the splendour which marks all the state entertainments of the City of London. His Lordship, William MacArthur, M.P., was supported by the President of the Congress, Sir James Paget, by Professor Langenbeck, and by most of the delegates from foreign countries to the meeting. His Lordship's speeches were chiefly devoted, as may be supposed, to offering a hearty welcome to the Congress, and to a eulogy of those master minds who had come from all parts of the world to contribute their *quota* to its success.

His Lordship's speeches were commendably brief, excellently expressed, and delivered with much oratorical skill and verve. Sir James Paget's remarks were worthy of his repute as a speaker and a scholar, and the addresses of the foreign representatives were, as a whole, eloquent and interesting. The entertainment will, without doubt, live in the recollection of those who partook of his Lordship's hospitality.

PENN'S.

LITTLE breathing-time has been left our foreign visitors, and those who have sedulously worked or pleased up to the programme, will have plenty of food for reflection hereafter. The name of Penn has become almost historical in all that relates to marine engineering, and the works which bear this name are among the great sights of London. On Friday last, a shipment, in which the foreign element predominated, left London for Green-

wich by steamer provided by the firm for the purpose of inspecting their enormous engineering works, and lunching with the head of the establishment. The Thames is certainly not picture-que between Westminster and Greenwich, but what it lacks in this direction is amply filled in by its miles of shipping, its gigantic wharves and warehouses, and its wealth of stores, not to be found elsewhere in the world. Our visitors were both amused and amazed as the steamer wended its way through the intricacies of myriads of craft, the never-ending lines of ships loading and unloading, the swarms of labourers as busy and as crowded as bees round a hive. The works also offered an irresistible attraction to the more mechanical portion of members, but all seemed satisfied with the fare provided, and returned to town early enough to undertake fresh work or pleasure according to their bent.

THE CONVERSAZIONE AT GUILDHALL.

THE reception, *par excellence*, of the Congress was that held by the Lord Mayor on Friday evening at the Guildhall. Hither flocked between three and four thousand members, many of them with their ladies. Those who came early were received in semi-state at the entrance, but later on this formality was done away with, the Lord Mayor, sheriff, and some of the members of Parliament for the city adjourned to the Concert Hall, and later arrivals roamed about the spacious library, ante-rooms, the Guildhall and crypt, with the utmost freedom and enjoyment. Here might be seen representative men of our common profession from all parts of the world, with here and there a visitor from the celestial empire, from Japan, Siam, Bengal, &c., dressed in costume strangely differing from the great majority, but withal, lending a picturesqueness to the gathering not soon to be forgotten by those who had the pleasure of being present. After the concert the Lord Mayor made a tour through the building, and, as he passed through the throngs everywhere to be found, he was received with loud cheers, in token of appreciation of his hospitality and that of the citizens of London, which has certainly been munificent throughout. Prodigious sums are spoken of as having been voted by the corporation for giving the members of Congress fitting receptions, and when the banquet of the previous night, and the *conversazione* of Friday, at which the best of wines flowed like water, be taken into account, the cost could only be met by several thousand pounds. But whatever this may be, certain it is that the hospitality was profuse and the appreciation thereof sincere.

EXCURSION TO FOLKESTONE.

On Saturday afternoon a special train, provided by the liberality of the South-Eastern Railway Co., conveyed a large number of English and foreign members to Folkestone, where one of the most interesting ceremonies in connection with the Congress took place in the unveiling of a statue of Harvey resulting from the labours of the Tercentenary Committee. The ceremony was performed by the venerable father of comparative physiology, Professor Owen, O.B., who, in the speech wherein he declared the statue to be transferred to the Mayor and Corporation of

the town in which Harvey was born, uttered an eloquent and unanswerable defence of vivisection as an aid to scientific advance. It may be hoped that the fanatic and ignorant persons who make it an aim to harrass the scientific investigator, and who band themselves into "Anti" Societies for the purpose of impeding his endeavours, may be brought to study the truth and principles that were enunciated with such peculiar force by the foremost of living anatomists. Rather than relate at wearisome length the well-known history of Harvey's labours and difficulties, Professor Owen chose more wisely to describe the bearing of experimental research on the advances made in medicine and surgery. Hunter's discovery of the effects produced by ligaturing the carotid artery of the stag, and the immediate application of the knowledge acquired by vivisection in this instance to the cure of a popliteal aneurism, formed one example of the *results* which anti-vivisectionists ignorantly deny to have followed the practice of the art they decry. How eloquently and how scathingly the tyrannical proceedings of the blind and wilfully ignorant band who are constantly struggling to place obstacles in the way of scientific progress, were denounced by Professor Owen, will be familiar to all who have had the felicity of sitting beneath him in the theatre, or of following his lead in the pursuit of truth. With him, they will indignantly assert the majesty of science, and the incomprehensible benefits it has conferred on the treatment of disease; while, with him, they will declare and believe that such untold good as has resulted has been *non ex libris sed ex vivisectionibus*, so far as the surgeon's art, at least, is concerned.

The guests who had been present at the unveiling of the statue proceeded thence to the Town Hall, where was laid a plentiful collation, to which ample justice was done, a selection of music being played during the entertainment. The party returned to town at 8.15, reaching Charing Cross at 10.30, after a most enjoyable and interesting excursion.

NORMANSFIELD.

On the banks of the Thames contiguous to Richmond, is an establishment which has grown from a small house to a mansion of gigantic proportions. Here may be found from one hundred and fifty to two hundred children of the imbecile class, whose parents belong to the upper and middle ranks of society, and who are content to place their unfortunate offspring under the enlightened treatment of Dr. Langdon Down. This establishment is called "Normansfield," and thither repaired several hundred members of the Congress and their ladies on Saturday last, in response to the invitation of Dr. and Mrs. Langdon Down to a garden party in the extensive grounds attached. The excursion was by special train to Hampton Court, the party being here met by Dr. Down, Sir Thomas Nelson the City Solicitor, and president of the United Thames Drainage Board, the Mayor and Town Council of Kingston, and the Chairman of the East Moulsey Local Board, and were conducted through the palace and grounds of Hampton Court; Sir Thomas Nelson kindly acting as spokesman, explaining with considerable tact in English and in excellent German, the various objects of interest in and around that historic

pila. On emerging from this, two steamers provided by Dr. Down were at the gates to take the party down the river to his residence, where had assembled about five hundred of the surrounding medical men, and resident gentry, and as the weather was everything that could be desired, and the hospitable host and hostess had provided every luxury in the shape of refreshment and amusement, a most pleasant day was spent, one that will be long remembered by the assembled visitors. The patients, it may be remarked had been sent to the Crystal Palace for the day, so that the guests might roam about the establishment without hindrance, and the remarks of the foreign elements were most laudatory of the perfect arrangements of this model asylum. The dormitories, kitchens, kindersaal, and other offices were voted by them better than anything of the kind they had seen in their several countries, whilst the new hall recently built for amusement during week days, and for divine service on Sundays, was greatly admired for its elegance and completeness. In this building we overheard two Germans remark: "What practical people these English are, instead of building two, they build one place, which serves for amusement in the week, and for religion on Sunday." Probably we shall hear more of our insular characteristics after the Congress is over, than we are even aware of possessing, but this we can safely say, that all the remarks heard in tongues many and various, have been kindly, and not the least so, those relating to the charming garden party at "Normansfield."

VISIT TO CROYDON SEWAGE FARM.

UPWARDS of 130 members proceeded on Saturday to the Sewage Farm, at Croydon, over which they were conducted by Dr. Alfred Carpenter, who subsequently presided at a luncheon given by himself on the farm. A number of interesting speeches were delivered, the chairman affording the guests assembled much satisfaction by announcing to them that all the good things they had partaken of with such evident relish were, in effect, so much transformed sewage, having all been produced on the estate. The question of sewage farming was somewhat fully discussed, and the whole of the demonstration formed a very interesting experience for the Continental members of the Congress, who were present in considerable numbers.

On Sunday Mr. Erasmus Wilson entertained fifty visitors at Margate, and Sir Trevor Lawrence received a party to luncheon at his residence at Box Hill.

The Royal College of Surgeons held a *conversazione* at the College in Lincoln's Inn Fields, on Monday evening, which, in spite of wet weather, was fully attended, great numbers of member making their way to it from the numerous farewell dinners which were the order on Monday.

SECTIONAL PROCEEDINGS.

THE sections were duly constituted on Wednesday afternoon, and in many cases the introductory addresses were delivered on that day. The regular work of the session, however, commenced on the following (Thursday) morning, and has regularly continued since each day. In most of the sections the attendance has been large

throughout, but the chief attractions have appeared, as might have been expected, to lie in the Surgical, Medical, Obstetric Medicine, and Pathology Chambers. It would be quite impossible to give any complete account of all that has gone on at the successive sittings; a mere enumeration of the papers read would alone occupy all the space at command, and we can only call attention to a few of the leading incidents.

A BABEL OF TONGUES.

ONE of the unavoidable drawbacks of the Congress has been again and again regretted by the many foreign and English members who have been unfortunately debarred from following the discussions in the various sections, on account of the multiplicity of languages adopted by speakers. It was, however, essential to permit freedom of choice in this respect to all, and in spite of the curious result produced on those who patiently gazed in unresponsive wonder at first one and then another unintelligible expositor of foreign science and practice, it is impossible to regret the consequences now that all is over. The student of the ludicrous might any day of the meeting have found in every section rich subject of amusement in the polyglot expression of interest successfully encouraged on the countenances of the respective presidents. The calm current of a debate would occasionally suffer from the occurrence of a little scene not to be dissociated from the circumstances, but, on the whole, matters worked smoothly along, with only occasional amusing *contretemps*.

LOCALISATION OF FUNCTION.

Much interest was excited amongst physiologists by the announcement that a discussion would take place in the section devoted to physiology, between Professor Goltz and Dr. Ferrier. This was commenced by the former, who spoke in German, and who emphatically declared his unshaken belief in the unreality of the "centres," in favour of which Dr. Ferrier contended. In a lengthy and powerful speech, which lasted over forty minutes, Prof. Goltz explained the numerous experiments on which his conclusions had been based, and finally detailed the history of a dog which he had brought with him to London, and in which he had successfully destroyed all the so-called cerebral centres, except the anterior frontal region of the brain. Yet this animal, eight months after the last operation, performed all the movements in all but a normal fashion; and displayed no change, save one of affected intelligence, and that but slight. On the other hand, Dr. Ferrier insisted on the real existence of centres of localisation, and produced his monkey in proof. This animal had been submitted to an operation in which the centre for movement of flexion of the fore limbs is situated, and it exhibited unmistakable symptoms of motor paralysis answering to the situation of the lesion. To the objection previously raised by Goltz that insufficient time had been allowed in his earlier experiments for recovery from intercurrent disturbances, Dr. Ferrier explained that it was then many months since the monkey had been submitted to operation. The exhibition of these two animals in the afternoon was a remarkable proof of the fallacious nature of arguments from consideration of comparative results; and it will probably tend to convince all

who witnessed it, that while it is impossible to regard the matter in dispute as any nearer settlement than before, it yet assuredly indicates how little reliance can be placed on deductions drawn from a study of widely-separated groups of animals rather than from multiplied experiments on those of the same species. Apart, however, from all this, the demonstration was a vastly interesting one, and we can only regret the apparently barren result as yet attained by the two distinguished exponents of opposite views as to localisation.

OTOLOGY.

Mr. Dalby's address to the Otological section commenced by welcoming the foreign members of the Congress, and pointed out that in Otology, more, perhaps, than in other branches of medicine or surgery, it was desirable that those practising it should have an opportunity of meeting and exchanging their views, for the reason that from two distant countries, Germany and America, most recent research in the scientific part and many advances in the practice of the speciality had proceeded.

He then proceeded to consider the subjects which had been specially chosen for discussion at the section. Amongst the classes of cases with regard to the pathology of which varying views are held, must be considered those of what is called proliferous catarrh of the tympanum, and this is included in the first question proposed for discussion: "The value of operations in which the tympanic membrane is incised." On this point great divergence of opinion exists, some surgeons never incising the membrane at all, others only in acute tympanic inflammation when there is evidence of pus, others empty it for evacuating mucus as well as pus, and others again empty it in cases in which the membrane is connected to the ossicles or to the tympanic wall by adhesions.

The second subject selected for discussion, "Morbid growths within the ear," includes long enlargements and exostosis, polypus, benign or malignant, and also the treatment of perforation of the membrane, as these almost always accompany and cause the growth.

The third subject, "The loss of hearing, where the external and middle ears are healthy," embraces a large number of cases. Under this head come syphilitic cases, so-called Meniere's disease, cases of deafness due to sudden nervous shock, &c. The obscure and often unmanageable symptom, tinnitus, will also be considered; the sudden and total loss of hearing due to mumps, diphtheria, &c., and many other causes.

SURGERY OF THE KIDNEY.

The Surgical Section was the scene of a lively and important series of debates, of which that on the surgery of the kidney was among the most fertile of suggestion. In connection with it, Mr. M. Baker, Mr. Barker, and other well-known surgeons, discussed the feasibility and advantages of nephrectomy, nephrotomy, and Mr. H. Morris' revival of nephro-lithotomy. The general conclusion to be drawn from the debate is distinctly favourable to the performance of those operations through which the kidney is relieved by direct exploration of its substance. With few exceptions, there was a universal expression of opinion

to this effect, and it cannot but be a gain to surgery that so common a determination is prevalent to push the resources of art to the extremest limits.

LITHOLAPAXY.

The surgery of the bladder formed a fitting subject for discussion after the conclusion of the debate on renal operations; and it, too, was an instructive demonstration of the advantages which have followed from the adoption of a plan of treatment which would, at one time, have been stigmatised as rashly heroic. The testimony of the most eminent surgeons was a unanimous approval of Bigelow's method of removing vesical calculi at a single sitting, and Sir Henry Thompson was not the least of those who expressed their admiration for the ingenious and distinguished surgeon's skill. In the surgical section there were a number of highly important and valuable papers read on different subjects, and several discussions were opened up on subjects of the first interest to surgery. Thus the question of early or late excision of joints in strumous individuals excited a keen debate, the general tendency being to approve the former treatment as safer. This can be taken as a sample of the problems before the section; the debates were, throughout, of the deepest interest.

We had intended to give a brief heading to all the salient features of the sectional proceedings during the week, but to do justice, even with brevity, to all, is an impossible matter; and we can now only add that Dr. Sayres' demonstrations on the pro-plastic jacket were a rich treat to visitors to the section on diseases of children; that a brilliant, and, at times, almost rancorous discussion was carried on in the obstetric section on Oöphorectomy; that Dr. Billings delivered an address of incomparable eloquence and power on Friday afternoon before a general meeting of the Congress; that in the Medical Section, albuminuria was exhaustively discussed; and that in all the different rooms no hour passed without events occurring to chain the interest of the hearer. In later numbers we shall deal more fully and more justly with the doings of the Congress.

THE OPHTHALMOLOGICAL SECTION.

The proceedings of this section have, under the presidency of Mr. Bowman, and the secretariat of Drs. Brailey and Nettleship, been conducted with great earnestness, and have yielded good scientific result. The deliberations of the section were especially directed to the discussion of the genesis of sympathetic ophthalmia, which was initiated by Professor Snellen. A most interesting debate as to whether the disease was reflex or the result of definite pathological change, and though no decisive verdict was arrived at, the balance of opinion seemed decidedly in favour of the pathological view. The application of antisepticism to eye surgery was also discussed at great length, upon an address by Professor Homer, of Zurich; and colour-blindness was also submitted to debate by papers communicated by Dr. Littreacht, of Ghent, and Dr. H. Bulé, of Christiana. Dr. Nieden, of Boehmm, also communicated an interesting paper on the causes of nystagmus in miners.

In the ante-room of the section Dr. Javal, of the Sorbonne College, Paris, exhibited and demonstrated a valu-

able addition to the *armamentarium* of the ophthalmologist, in the shape of an optometer for the detection and measurement of astigmatism. Two white objects are placed in front of the patient, fixed at a given distance from each other, upon an arm, which can be rotated, so that the objects describe a circle round the axis of vision. These objects are reflected from the patient's cornea, and if the cornea be normal the reflections will always occupy the same relative position towards each other. If, however, an astigmatic meridian exists, the images of the objects will become super-posed, and the extent of that super-position, being indicated on a dial, gives both the amount of the astigmatism and the angle of the faulty meridian.

In the Museum of the Congress there were exhibited some objects worthy of notice. The instrumental novelties are chiefly confined to refracting ophthalmoscopes, of various patterns. Dr. Nieden exhibits a series of unbreakable artificial eyes, which are, however, unsatisfactory in colour. A very beautiful series of wax models of actual dissections of the ametropic eye are also shown, the myopic eye being especially well shown.

The proceedings of the Section have impressed us very forcibly with two considerations: first, that to learn much from an International Congress one must be master of every known language; second, that practical eye surgery has suffered eclipse by the importance attached at such a meeting to abstract questions of ocular pathology. A paper or a speech delivered in our own language, or conversant with any of the problems of practical eye surgery was, in the sittings of the section, a blessed relief from the Babel of tongues and the repetition of physio-anatomical disquisitions. Far be it from us to discourage the enthusiasm of the German school, or to depreciate the value of their labours and their thought on these subjects. Such investigations are indispensable to the progress of ophthalmology, and have produced grand results, but the question for the managers of the Section at future Congresses is—whether so much time ought to be devoted to the elaboration of theory, and so little to the development of practice; and whether a little curb might not be advantageously applied to the enthusiasm of our foreign *confrères*.

OUR MEDICAL LITERATURE.

DR. BILLINGS, of Washington, was honoured by a very considerable audience on Friday to listen to his address on "Our Medical Literature," and fully rewarded were all who managed to escape the pomps and vanities elsewhere, or the labours of the sections, by hearing one of the most able, exhaustive, and certainly the most racy oration of the Congress. Of course the subject was attractive and capable of profound elaboration, and as editor of those magnificent volumes now being compiled for the Surgeon-General's Office at Washington, Dr. Billings was *facile princeps*, and succeeded most admirably.

He estimated that one-thirtieth part of the world's literature belongs to medicine and the allied sciences, Medical literature owning 120,000 volumes and twice as many pamphlets, with a yearly increase of 1,500 volumes, and 2,500 pamphlets. Of the 180,000 educated medical men scattered over the world, 11,600 contribute to this

mass of literature, the United States having the larger actual per-centage, and England being outdone by the Germans and French, as well as by the Americans. Reckoning, however, the number of physicians in each country, France shows the greatest, and the United States the smallest proportion. Referring to the short lives of most new medical journals, he adduced figures to show that in 1880 there were 24 deaths and 78 births. But Great Britain (John Bullish even here) "is the most stable of all;" her old journals being on very secure foundations, and new ones not often started.

On the subject of general medical literature he remarked that in days of old, when the profession of medicine, or of a single medical specialty, was an inheritance in certain families, a large part of their knowledge and the efficiency of their remedies was thought to depend upon these being kept a profound mystery. Among the precepts of magic there was no more significant one than that which declared that the communication of the formula destroyed its power, and that hence attempts to reveal the secret must always fail. We have changed all that. Every physician hastens to publish his discoveries and special knowledge, and a good many do the same by that which is not special, or which is not knowledge. For the individual in a degree—for the nation or the race in a much greater degree—the literature produced is the most enduring memorial. And thus in our great medical libraries each of the folios or quaint little black letter pamphlets which mark the first two centuries of printing, or of the cheap and dirty volumes of more modern days with their scrofulous paper and abominable typography, represents to a great extent the life of one of our profession and the fruit of his labours, and it is by the fruit that we know him. The learned orator concluded his address with a trite verse from the Talmud, which reminds one of the first aphorism of Hippocrates. "The day is short and work is great—the reward is also great and the master presses. It is not incumbent on thee to complete the work, but thou must not therefore cease from it."

Notes on Current Topics.

Guy's Hospital Again.

WE very much regret to observe that Guy's Hospital is once again the subject of public comment and newspaper reports. How far it is unjustly elevated at this time as an object of public inquiry we must wait to have determined by the result of an adjourned investigation as to the circumstances attending the death of a patient of that institution. It is alleged that deceased died from pyæmia set up by burns which had been improperly treated, and for the relief of which he applied at Guy's Hospital. The case was refused admission as an in-patient, and was seen only in the out department of the hospital. The medical evidence given at the inquest attributes death to blood-poisoning consequent on improper treatment of the wounds, and the coroner, Dr. Danford Thomas, rightly deeming the matter of importance, adjourned the inquiry for a week. It is charged

upon the Hospital that irresponsible officials saw and treated the case, and that it was attended to throughout the time that it continued as an out-patient by the same officer. We repeat that we can offer no explanation as yet, but we do sincerely feel regret that the ill-fated charity is thus again brought to unfavourable notice. The conclusion to this inquiry will be looked for with painful interest, and we trust it may effectually relieve the hospital of the unpleasant shadow now upon it.

Metropolitan Hospital Sunday Fund.

A MEETING of the Council of the Hospital Sunday Fund took place last Friday at the Mansion House, under the presidency of the Right Hon. the Lord Mayor. The principal business of the meeting was that of receiving the awards of the Committee of Distribution to the several institutions, and of sanctioning the payment of £27,402 to ninety hospitals and four institutions classed as hospitals, £2,513 to fifty dispensaries, and the setting aside of £610 for the purchase of surgical appliances during the ensuing twelve months. We have before stated that the sum collected this year exceeds by upwards of a £1,000 that of any other year's collection. On this occasion, as there is an increase of ten in the number of institutions brought into the list of those participating, it necessarily prevented any great increase in the several awards to the larger hospitals, but as money is still coming in, Dr. Glover thought £500 more might well be distributed amongst the dispensaries. The Bishop of London, on moving the adoption of the report, congratulated the Council on the gratifying circumstance that so few complaints had reached them respecting the administration of the Fund; and when a doubt arose, a few kindly words of explanation had on all occasions tended to smooth the way to a somewhat higher award than would otherwise have been made. This showed that a feeling of comparative unanimity had at length been arrived at. There was one other subject which, although not directly a part of the Hospital Sunday Fund, grew out of it. It was shown by the recent census returns that London had largely increased in population. This naturally suggested a question for consideration for philanthropists whether the hospital accommodation of the metropolis had kept pace with the growth of population. Then, as to the distribution of hospitals, whilst a decrease of population appeared to be taking place in the central part of the metropolis, the outer ring was increasing rapidly. Nevertheless, the fact was overlooked, and it was most inadequately provided with hospital accommodation. This must be especially felt in cases of accident and emergency. This also brought into notice another want in times of need—that of an efficient ambulance service, and which those interested in the matter believed should be provided without much delay.

Mr. Jabez Hogg informed the meeting that the want of peripheral, as distinguished from central, accommodation for the sick poor, had for some time occupied the attention of the medical profession, and in consequence a committee convened by the British Medical Association had not long ago determined to bring the question before the Home Secretary, and ask him for a Parliamentary Committee of Inquiry for the purpose of fully investigating this subject, as well as that of the management of hospitals, so that this

matter was in a fair way of receiving a thorough sifting. As for ambulance accommodation, London would do well to follow the example of New York city, where was to be found a most efficient ambulance system in operation. The police were in telephonic communication with every hospital, as well as fire-engine station, and the moment an accident occurred, an ambulance was in readiness to convey the suffering to the nearest hospital. A well-deserved and cordial vote of thanks to the Lord Mayor, for the interest he had manifested in the Fund, brought the meeting to a close.

The Pharmacist's Grievance.

THE Pharmaceutical Congress, which was held last week, afforded an opportunity for official expression of the dissatisfaction the pharmacists feel at their exclusion from the Pharmacopœia Revision Committee. The occurrence is an amusing episode in the history of the week, and a good deal of quiet enjoyment will have been obtained by medical men from a perusal of the report in which the address appeared. It is apparently a very sore point with the chemists that doctors are able to dispense with their services in determining the direction in which improvements in the pharmacopœia are required. Likewise too are they outspoken in denunciation of the work they are so benevolently anxious to assist in remodelling. We cannot, however, resist the conviction that a body so zealous in complaint might be capable of performing, itself, something in the direction of the improvement it bewails the continued absence of. If the Pharmaceutical Society is able to mark the weakness of the legitimate pharmacopœia, it might exhibit itself in a favourable light by undertaking and carrying out the reforms it advocates. We will undertake to assure it that if it produces a better and more reliable work than that which is the outcome of "mere doctors," the latter will not be slow to adopt it in preference to what the Pharmaceutical Society, we feel sure, regards as an effete and worthless performance.

Boylston Prizes.

THE Boylston Committee which is appointed by the President and Fellows of Harvard University, has proposed the following questions for competition among intending candidates for the Boylston Prizes of 1882:—

1. Sewer-Gas, so-called (the gas found in sewers): What are its Physiological and Pathological Effects on Animals and Plants? An Experimental Inquiry. The author of a dissertation on the above subjects, considered worthy of a prize, will be entitled to a premium of three hundred dollars.
2. The Therapeutic Value of Food, administered against, or beyond, the Patient's Appetite and Inclination. The author of a dissertation on the above subject, considered worthy of a prize, will be entitled to a premium of two hundred dollars.

The following are the questions proposed for 1883: 1. Measles; German Measles; and their Counterfeits. 2. The Differential Diagnosis of Abdominal Tumours; especially those connected with the Genito-Urinary Organs. The author of a dissertation, considered worthy of a prize, on either of the subjects proposed for 1883, will be entitled to a premium of two hundred dollars. Each dissertation must be accompanied

by a sealed packet, on which shall be written some device or sentence, and within which shall be enclosed the author's name and residence. The same device or sentence is to be written on the dissertation to which the packet is attached. The writer of each dissertation is to transmit his communication to the President of the Committee, D. H. Storer, M.D., 182 Boylston Street, Boston, Massachusetts, in a distinct and plain handwriting, and with the pages bound in book form. The dissertations for 1882 must be received on or before the first Wednesday in April, 1882; and those for 1883 on or before the first Wednesday in April, 1883. Any clue by which the authorship of a dissertation is made known to the Committee will debar such dissertation from competition. Preference will be given to dissertations which exhibit original work. All unsuccessful dissertations are deposited with the Secretary, from whom they may be obtained, with the sealed packet unopened, if called for within one year after they have been received.

Medico-Psychological Association.

THE Thirty-sixth Annual general meeting of this Association was held in London on Tuesday, August 2nd, at University College, under the presidency of Dr. Hack Tuke. At the morning sitting, the proceedings included a vote of thanks to Mr. J. W. Mould, the retiring president, and the resignation by Dr. Clouston of his post as an editor of the *Journal of Mental Science*. At the afternoon meeting the President read an address in which he reviewed the history of Lunacy Legislation and Treatment during the last forty years. At its conclusion the Earl of Shaftesbury, who was present, moved a vote of thanks to Dr. Hack Tuke, adding from his own experience, detailed particulars in corroboration of the statements contained in the address. Dr. Bucknill seconded the vote and it was carried with acclamation. The members of the Association dined together in the evening at the Freemasons Tavern, where they were joined by several distinguished guests including Mr. Justice Fry, Dr. Tambarini, Dr. Benedick, Dr. Boville, Professor Motet, &c., &c.

Bequests to Medical Charities.

UNDER the will of Mr. McGavin, the Royal Infirmary, and the Western Infirmary, Glasgow, will receive £1,000 each. Mr. William George Campbell, formerly a Commissioner in Lunacy, has bequeathed £300 each to St. George's Hospital, the Consumption Hospital, Brompton; Queen Charlotte's Lying-in-Hospital; and the Fund for Discharged Persons from Asylums, Hospitals, and Licensed Houses, in connection with the Commissioners in Lunacy. Mr. W. Grimwood Mantle, late of Leicester Square, London, bequeathed £1,000 to Charing Cross Hospital; £500 to the Royal Hospital for Incurables, Putney; £200 each to the Westminster Hospital; the Royal Free Hospital; the Cancer Hospital, Brompton; St. Peter's Hospital for Stone; the Paralytic Hospital, Queen's Square; and the Ipswich Hospital; and £100 to the Lowestoft Hospital.

We understand that an addition has been made to the number of Leith charities by the placing of a sum of

£18,000 under trust, with directions to the trustees—two-thirds of the revenue for the maintenance of a ward in the Leith Hospital, to be called the "Stead Medical Ward," subject to certain specified conditions, and one-third for the relief of persons suffering from incurable disease, natives of Leith being preferred.

Women Candidates at the University of London.

THREE students of the School of Medicine for Women, passed the preliminary scientific M.B. examination of the University of London, viz, Miss Bernard, Miss Alice Palmer, and Miss Webb. Three also were examined at the first M.B. examination, and all were successful, two passing in the first division, Mrs. Scharlieb, Miss Prideaux, and Miss Tomlinson.

Station Hospitals in India.

WE understand that the new station hospital system will be shortly introduced into all the Indian military establishments. A considerable saving will be thus effected in *personnel*, instruments, &c., with increased efficiency. Dr. Crawford, Surgeon-General H. M. Forces, and principal medical officer to the Government of India, has just completed his annual tour of inspection, and is now back again in Simla.

The Medical Services.

ACCORDING to the published lists of surgeons on probation at Netley for the Army and Indian Medical Services respectively, the highest number of "marks" obtained by candidates for the former was 2,320, against 5,210 for the latter; the lowest, 1,345, against 2,990 for the Indian. That is, the probationer for the Indian service whose qualifications may be supposed to be represented by the minimum number of "marks" was in that respect 670 ahead of the maximum awarded to the probationer whose name heads the list for the British service.

If this comparison represents the estimation in which these services are severally held by young medical men, the conclusion to be drawn therefrom is that, on the one hand the disadvantages of an Indian career, as pointed out by certain recent representations, are certainly not of a nature to deter men of very high qualifications from seeking to adopt it; on the other hand, all the high expectations as regards the medical service of the British army which have been raised by recent Warrants has so far resulted in attracting to its ranks candidates whose qualifications are represented by the figures already given. Among the whole number there is shown to be a sliding scale, from 5,210 downwards to 1,345—the range thus shown, equal to 3,865 degrees of excellence—in other terms, 1,543 greater than the highest number awarded to the candidate who heads the list of those for the British Medical Service. Among the names of successful candidates for the Indian Service are several which have an Oriental ring about them.

THE twenty-fifth anniversary of Dr. Rudolf Virchow's appointment as Professor in the University of Berlin is to be celebrated on October 13th.

The Army Hospital Corps.

THE designation of officers of the Army Hospital Corps has been changed. Formerly they were known as apothecaries and purveyors, more recently as captains and lieutenants of orderlies and now they are transformed into quartermasters. Although they don't like the change of title, they express no urgent desire to revert to their old original designations; they cling, however, to the more military titles—not indeed with the affix as until very recently borne, but with the prefix "Honorary,"—which prefix admits of being easily and conveniently dropped when occasion requires, as doubtless would often happen. If it be intended that the particular titles borne by officers shall in some degree indicate the nature of those officers' duties, surely the titles now sought are less appropriate than either of the two first stated in this note. And, if the officers charged with the care of hospital stores, the clothing and payment of orderlies, are really to be dubbed captains, &c., surely medical officers who are now charged with the command and discipline of those men ought also, and will doubtless, claim to have similarly military titles. We do not suppose that their status is likely to be advanced in consequence; but, nevertheless, the possibility of such a change begins to loom in the distance.

Awards to Public Vaccinators.

In the House of Commons last week, Mr. Dodson, replying to Mr. Burt, said that the principle on which awards were given to public vaccinators was that an inspector of the Local Government Board should be satisfied by a careful personal examination of a considerable number of children, that the results of vaccination were up to the prescribed standard of merit; that was to say, that scars should cover a certain area and be well marked. Further, the inspector was required to see that the public vaccinator had been punctual in his attendance at the vaccination station, and that the cases had been duly certified and registered; and if these conditions had not been complied with the rewards were withheld. Notwithstanding anything that Mr. Burt may say, the system of awards has worked admirably, and the expenditure thereupon has been more than repaid to the public by the increased efficiency of vaccination. It is difficult to understand, however, why Ireland should be denied the benefit of arrangements which have worked so effectually elsewhere. In that division of the kingdom there is no inspection of vaccination nor any rewards for effective performance of the operation. The vaccinator is paid a given fee per head for his cases, and, of course, the tendency must be for unsystematic practitioners to content themselves with making a scar of some sort, it being of no immediate interest to them whether or not the patient is effectually protected against small-pox.

Indian Native Army Hospital Corps.

MEDICAL officers in charge of the various hospitals have received orders to take steps immediately to attest qualified men for the above corps, and to weed out ineffectives from their present hospital establishments—a reform long since needed in our great tropical dependency.

"Neglect of Medical Registration."

THE frequency of the complaints made to us of the erasure of names from the "Medical Register" makes it desirable that we should remind those who complain that in most cases the fault is purely their own, and they deserve no sympathy. By the 14th Section of the Medical Act they are liable to have their names erased from the "Register" if they fail to answer the Registrar's inquiries, in regard to their addresses. It is clearly made known to them that they should be careful to answer such inquiries; and that all that is required of them is to state in the Form whether the printed address (cut out of the "Register," and pasted thereon) is correct, or if not, to correct it. Although it is difficult to conceive that anybody would, by the neglect of so easy a duty as this, incur the liability thereby entailed on him, yet it is to be feared that some of our readers have neglected it, so that, unless they communicate with the Registrar they may, in the next edition of the "Register," fail to find their names.

New Batch of Brigade Surgeons.

THE Gazette of the Military Department, Government of India, dated Simla, 17th June, announces the promotion of twenty-four surgeons-major of the Indian Medical Department to the rank of brigade-surgeon, their commissions ante-dated to the 27th November, 1879. The greater number of these officers are under twenty-five years' service, viz., Surgeons-major Dale, Simpson, Hutchinson, Pitchall, Currie, Singer, Sutherland, Eteson, Watson, Cowie, Palmer, Lock, Rouse, Jackson, Garden, Walker, Watson, Matthew, Fairweather, Pickton, Bird, Martin.

A GENTLEMAN has offered to give £1,000 towards the establishment of Convalescent Homes for Scarlet Fever Patients, near London, provided nine others will each contribute a like amount this year.

THE *Charity Record* computes that including hospitals of every kind and workhouse infirmaries, but excluding lunatic asylums, there are, in the metropolis, about 30,000 beds available for diseases and accidents, and 1,474 permanent beds for infectious fevers.

THE cities which have at present the highest death-rate are St. Petersburg, Berlin, Breslau, Naples, Baltimore and Alexandria, all of which show, what in this country would be considered an extreme epidemic rate, a mortality of from 40 to 60 per 1,000 of their populations.

FROM diseases of the zymotic class measles showed the largest proportional fatality in Liverpool and Sheffield; scarlet fever in Hull, Nottingham, and Leicester; and whooping-cough in Birmingham. The fatal cases of diarrhoea, which had increased from 73 to 652 in the five preceding weeks, further rose to 795 last week; the death rate from this disease last week ranged from 0.7 in Plymouth and Wolverhampton, to 6.7 in London and Hull, 8.6 in Nottingham, 9.4 in Leeds, and 15.3 in Leicester. Small-pox caused 44 more deaths in London and its

outer ring of suburban districts, 3 in Liverpool, one in Glasgow, and one in Brighton; no fatal case of this disease was recorded in any of the other towns.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

PURE WINES.—It unfortunately amounts to a truism that generally speaking there is no article of commerce to a greater extent subjected to adulteration than wine. This arises, doubtless, from various causes, prominent among which must be recognized the large consumption of wine, and the desire on the part of so many to obtain the bouquets of high-class wine at a small and often inadequate price. This is certainly unfortunate for the physician, for apart from his proper *armamentarius medica*, to no other article has he more prompt recourse in cases of exhaustion and debility from various causes than to what he believes erroneously to be the genuine juice of the grape. We fail to see why any other taste than that of the genuine wine should be encouraged or administered to; while we are perfectly persuaded that instead of being productive of benefit, dyspepsia and other gastric and liver derangements result frequently from the employment of too highly fortified and sweetened wines. The physiological value of the vegetable acids to the human system in giving an impetus to oxygenation and consequent metamorphosis of tissue is too well known to every educated physician to be dilated upon. All wholesome wine ought to contain these acids in their natural state. The process of "fortification" and "plastering" to which so many wines are subjected precipitates the natural tartrates, and thus detracts from their value as medicinal agents. Certain Greek wines, which have recently been brought under our notice by Messrs. Denman, of Piccadilly, London, present the commendable feature of being pure, of not having been so treated, and of thus being valuable to the extent of their purity. In addition to this their bouquet is peculiarly agreeable, particularly that of St. Elie, Santorin and Kephisia; and we have no hesitation in saying that the medical profession is under a debt of gratitude to Messrs. Denman, which a more extensive knowledge of these wines will cause to be duly appreciated.

GLASGOW ROYAL INFIRMARY APPOINTMENTS.—The uncertainty which prevails in the profession regarding the frequently recurring announcements as to vacancies at this valuable institution is bearing manifest fruit. For the past two months an advertisement inviting candidates for numerous offices at the infirmary appeared in the daily and medical papers. It was fairly enough contended in the profession that if there are no vacancies candidates should not be invited to apply; should not be put to the trouble and expense of instituting a canvass. In harmony with this view we understand that application for the office of physician to the house and that of lecturer on medicine was formally made by one candidate. There were no applicants for the numerous vacancies, and the candidature in question was not prosecuted on the representation being made that the advertisement was purely formal, and that the occupants of all the offices were sure to be re-elected—in short, that there was no vacancy. At the eleventh hour, the day before the election, Dr. Wallace Anderson is prosecuting a canvass, with the information, then only made public, that Dr. Wood

Smith intended resigning. Several of the directors went to the meeting quite unaware of this being the fact, and were considerably surprised when the announcement was made. The directors seem to have been paid in their own coin. They invited applications from the profession when they believed there was no vacancy, and a vacancy turns up wholly unexpected by them with but one candidate seriously an applicant. This course seems manifestly unjust to the directors, who, by the conduct of Dr. Wood Smith, were precluded from selecting from any number the most suitable candidate for the position; and it is equally unfair to the profession to be thus taken unawares. This is really a pretty *coup d'état*. The directors are building a magnificent medical school, and we sincerely trust that they will not have cause to regret having acted as they have done.

EDINBURGH UNIVERSITY PRIZES AND DEGREES.—Last week the capping ceremony took place under the presidency of the Lord Justice-General, Chancellor of the University, when the annual distribution of prizes were awarded to the successful candidates. The Ettes prize fell to Barclay Josiah Barron; the Blaney prize to David Hepburn; the Goodsir prize to Dr. Matthew Hay; the Wightman prize to Francis William Grant; and the Forensic prize to Robert L. Orr. Degrees were conferred in the following classes:—Doctors of Medicine, 35; Bachelor in Medicine and Masters in Surgery, 126; Bachelors in Medicine 8; Masters in Surgery, 1. Professor Annandale afterwards delivered an address on "Quackery."

EDINBURGH EXTRA-MURAL SCHOOL.—At a late meeting of the lecturers of the Extra-Mural School, Edinburgh, Dr. Alexander Miller was selected as the orator of the School to deliver the Introductory Address next October.

THE COLLEGES OF PHYSICIANS AND SURGEONS, EDINBURGH—DOUBLE QUALIFICATION EXAMINATIONS.—At the recent examinations for the final the numbers daily rejected are alarming. On one day only three out of twelve passed; on another, six out of twelve failed; and the other days do not show a better per-centage of success. The colleges are determined to deal sharply with the "chronics," and many who have come to hold the Edinburgh Colleges in little estimation have learnt a lesson they will not soon forget. We are able to state that the questions put to the candidates were, as a rule, fair and searching.

PROBABLE HONOURS TO THE MEDICAL PROFESSION IN EDINBURGH.—There is considerable speculation here as to the honours which Her Majesty may confer on the members of the medical profession during her visit to Edinburgh this month. Some suggest Mr. Spence, Surgeon to Her Majesty in Scotland and Professor of Surgery in the University; others Professor MacLagan. Several other names are mentioned, but these are evidently the playthings of idle gossip. With regard to Professor Spence, any honour conferred by her Majesty would be gratefully acknowledged by the profession. Medicine has been so honoured in the person of Sir Robert Christison, and it would be only fitting that the claims of surgery should be acknowledged in the person of the foremost surgeon in Scotland. It would be an honour also to the University, the tercentenary of which we are preparing to celebrate next year. The claims of Professor MacLagan to any special mark of her Majesty's favour are not easy to understand. Professor MacLagan is an upright and honest gentleman, but he does not hold that prominent position in the medical profession occupied by Professor Spence.

Literature.

ST. GEORGE'S HOSPITAL REPORTS. (a)

THIS volume of reports is one on the publication of which we may offer our hearty congratulations to the staff of the hospital, and especially to the editors, Dr. Thomas T. Whipham and Mr. Pick. It has rarely been our lot to examine a series of hospital reports so important and instructive, or one that gave so much clear evidence of thoroughly good work done. Did our space permit of it, we would gladly endeavour to give a summary of the various reports of the several departments of the hospital. As a proof of the full and exhaustive nature of these departmental reports, if they may be so termed, we may mention that they occupy 471 pages of the volume. If we were to single out any one of these reports for special commendation, it would be, we think, that of the surgical registrar, Mr. W. H. Bennett.

The original communications, which are ten in number, fully sustain the high reputation of St. George's Hospital. They commence by an obituary memoir of the late Mr. Thomas Tatum, who, for twenty-eight years, was surgeon to the hospital, and "whose memory will ever be treasured by St. George's Hospital as that of a warm-hearted friend, an earnest teacher, and an eminent surgeon." Though not a voluminous writer, what he did contribute, justly remarks his biographer, "was, like the man, sterling, and as tried gold. His article on Injuries and Diseases of Muscles in Holmes' System of Surgery is a clear and forcible exposition of all that was known at that time of a class of injuries and diseases which had attracted little attention, but to which he had devoted much study." He was a brilliant operator, and a fluent and impressive lecturer.

Mr. Holmes contributes a valuable clinical record of great practical interest. The first is a case of ilio-femoral aneurism, which was, in the first instance, treated by compression applied to the common iliac artery. This failing, and during the progress of gangrene of the leg and foot, the iliac artery was tied with an animal ligature (Mr. Barwell's.) In consequence of the gangrene, amputation had to be performed, first of the leg, and subsequently of the thigh. Double pleurisy then set in, and also thrombosis of the other leg, but, notwithstanding, the patient ultimately recovered.

The chief points which Mr. Holmes directs attention to in this remarkable case, are: "1. The rapid growth of the aneurism; 2, the failure of compression, although well borne by the patient, and unusually efficient; 3, the consequent occurrence of gangrene, and the threatened rupture of the aneurismal tumour; 4, the Hunterian operation on the artery, and the kind of ligature employed; 5, the long-deferred amputation; and 6, the various perils from which the patient ultimately came out safe." In the deligation of the iliac artery, the particular form of animal ligature, recommended by Mr. Barwell, was made use of, and although fears were entertained by Mr. Holmes that the fluids in the wounds would soon soften, and relax the knot, experience proved that the fear was vain. It is of importance to learn from so high an authority as Mr. Holmes, that "nothing could have answered better than this ligature," and gives "much encouragement for the use of the same or similar substances in future."

The second case recorded by Mr. Holmes, is one of an old fracture of the patella, which was reunited with wire sutures under antiseptic treatment. Very alarming constitutional symptoms supervened after the operation, notwithstanding the careful antiseptic precautions adopted, nor did success attend the attempt to keep the wound aseptic. The patient ultimately recovered, the knee being "completely stiff," and a "good deal of thickening about all the bones which formed it, especially the tibia." The progress of this case, after operation, was such as to make Mr. Holmes come to the conclusion that "the operation is not so safe as the occurrence of a few successful cases has led its advocates to declare." We think there are few surgeons of practical experience that will not endorse this opinion, having regard especially to the fact that patients who have sustained this fracture, and in whose cases there has been a wide separa-

tion of the fragments, obtain subsequently excellent use of the limb, and which is not, as a rule, "completely stiff."

The third case is also one of much clinical interest. It is one in which a sub-periosteal resection of the tibia in which the ankle-joint was also implicated, was successfully performed. The portion of bone removed measured 8 inches. It was in a crumbly softened condition at its lower end, "and, from this point, inflammation extended into the medullary cavity, which was occupied in its entire length by inflammatory products." The result of the case was very gratifying; "the knee-joint was sound. He could bear some weight on the limb, and walk without pain. His health was good." The two most noteworthy features of interest in the case are 1, that the whole diaphysis was not removed, a section of the bone having been made below its upper epiphysis; and 2, that the abscess had made its way into the ankle-joint before the operation.

The surgical value of sub-periosteal resection is, in our opinion, much more evident in cases such as the above, than in those where the procedure is adopted in cases of caries of any of the articulations. In truth, the favourable anticipations that were entertained of sub periosteal resection of joints, held originally by Langenbeck, Ollier, and their pupils have not, in our experience, been realized. The case is different where the diaphyses of bones entirely, or a part, have to be excised.

In a clinical lecture on the treatment of wounds, Mr. T. Pickering. Pick gives an interesting and exhaustive account of the various changes and improvements that have taken place in this department of surgery during the last twenty-five years. We quite agree with the author in thinking the introduction of metallic sutures to have been a "grand step" in the onward progress of surgery, but we notice with regret that the name of our distinguished American confrère, Marion Sims is not mentioned in connection with this important advance. In the author's estimate of torsion, we cannot at all agree. It is quite contrary to our experience to observe that the twisted end of the vessel "becomes, in itself, a foreign body, and constitutes a formidable source of irritation." We feel confident, however, a surgeon of Mr. Pick's ability will, on obtaining a larger experience of torsion, modify his views on the value of this mode of securing arteries.

In a very admirable and exhaustive essay, Mr. Edward Stirling draws attention to the occasional occurrence of certain eruptions of the skin which occur after recent operations and wounds. He points out, we think, that these eruptions are of a two-fold character, and fairly establishes the following points:—"1. That in a large proportion of cases the eruption in question is that of scarlatina. 2. That it occurs so frequently as the immediate sequel of an operation or injury, as to warrant the assertion that it is in some way, connected with the presence or infliction of the wound. 3. That the disease when it occurs under these circumstances, often departs from the normal type of scarlet fever. 4. That simple non-infectious rashes may, in like manner, occur in the traumatic state, and that the cause of these also must be referred to the existence of the wound or injury."

The occurrence of either scarlatina or scarlatina-like eruptions after surgical operations do not, however, as a rule, occur with at all the same frequency that Mr. Stirling would have us believe. He observes that in a period of about twenty years at Great Ormond Street Hospital, the number of cases of scarlet fever intercurrent in surgical cases was 168, and "out of these 31 were cases of operation." He observes, also, that he is "convinced that this is nothing like a true ratio, and that the number of cases occurring after operations should be increased." We are bound to say this does not tally with our experience. In one of sixteen years' duration in a purely surgical hospital, we cannot recall to recollection a single instance of scarlatina occurring as an immediate sequence to the performance of a surgical operation. The comparative frequency with which it occurs after operation in Ormond Street Hospital, is eminently suggestive of a defective sanitary condition in that Institution.

It is interesting to learn the scarlet fever which Mr. Stirling has so frequently observed following wounds, "undergoes certain deviations from the normal type of this disease." Among these may be mentioned the shorter duration of the premonitory fever, and the frequent absence of sore throat. The affection appears to be more frequently

(a) "St. George's Hospital Reports." Edited by Thomas T. Whipham, M.B., F.R.C.P., and Thomas Pickering Pick, F.R.C.S. Vol. X. 1879.

connected with the minor, rather than the surgical operations. Other cases of eruptive diseases, such as urticaria, erythema, and herpes, are also given, which are believed to depend on disturbed vaso-motor action, the result of reflex nervous irritation. Mr. Stirling's paper is undoubtedly of great clinical interest and importance.

Mr. John H. Morgan contributes a very valuable paper on some minor points to be attended to in the diagnosis of the early stages of hip-joint disease. The lameness is due to a two-fold cause, partly to "an effort to avoid the pain which follows any jarring of the injured surfaces of the joint, and compression of the inflamed synovial membrane," and also to a certain amount of shortening, which follows from involuntary muscular contraction, and causes flexion of the knee and hip. The lameness and peculiarity of progression is distinguished from that observed in other abnormal conditions, such as partial paralysis, locomotor ataxy, and congenital laxation, one of the chief differences being that in these latter conditions the lameness is constant, whereas in hip-joint disease, in its early stage, it is hardly perceptible after rest. The various phenomena connected with the disease, and which are associated with reflex nerve influence, are fully discussed. These are the pain referred to in the knee through the medium of the obturator, the locking of the joint due, in the first instance, to muscular action, resulting from nerve irritation, "the vital ankylosis," as the late Prof. E. Adams used to term it. At a later stage, the condition resulting from arm irritation is replaced by a permanent stiffness, resulting from a deposit of interstitial connective tissue, which "knits together the tendons, the muscles, and the parts immediately surrounding the joint."

Another condition, connected with the effects of reflex action, is also discussed, and that is, the altered oblique position of the pelvis, which causes the ilium of the affected side to be raised to a higher level than that of the opposite. This is, doubtless, due not only to voluntary muscular action, but also, according to Mr. Morgau, to a constant muscular contraction in obedience to reflex nerve irritation of the muscles, which raise the ilium.

Wasting of the limb, which is, as a rule, so constantly present, even at an early period of the affection, is, according to Sir J. Paget, far in excess of that which would result from disease of the muscles alone; and to this the name of "reflex atrophy," which seems dependent on disordered nervous influence, and often appears proportionate to the coincident pain, as if it were due to the disturbance of some nerve centre, irritated by the painful state of sensitive nerve fibres. (Clin. lect.) Many interesting cases, illustrative of the truth of this, are given.

Mr. Wyndham Cottle contributes a thoroughly practical and interesting communication on "Herpes Gestationis," the affection described by Mr. Erasmus Wilson under the name of "Herpes Circinatus Bullosus." The records of the cases that have been noted by various dermatologists—Hebra, Hardy, and others—induces the author to consider herpes gestationis as a neurosis depending upon uterine irritation. He divides the cases into two classes—(1) those in which the eruption declared itself within a few days of delivery only, while the period of gestation had been comparatively free; and (2) those in which the rash had appeared early in the pregnancy, and had persisted till after parturition. The disease is characterised, according to Mr. Cottle, by its occurring only in connection with pregnancy; that it commences usually as an erythema, which vesicates at the height of the eruption; that it is accompanied by intense itching and distress; follows the course of no bones; generally commences on the arms; is followed by more or less staining of the skin, and generally recurs with each succeeding pregnancy. From the recorded examples of this disease, and from the one which he has himself detailed, Mr. Cottle is disposed to think the affection should be "regarded as a vesicating erythema, rather than that it should be grouped with the herpetic or bullosus classes." He proposes, and we think with sufficient reason, to designate the affection "Erythema gestationis."

There are other valuable communications in this volume, which, did space permit, we would gladly refer to more particularly. Among these may be mentioned Mr. Gaskoin's paper on "Ichthyosis," on "Tubercular Meningitis," by Mr. Howard Barrett, and on "Trismus Infarctum," by Mr. William Bruerton. These papers possess much merit, and will well repay perusal.

We cannot say more of this volume of "Hospital Reports" than express our strong opinion that it is in every way worthy of the noble institution from which it has issued.

Correspondence.

CALF LYMPH.

AU REDACTEUR DE LA MEDICAL PRESS AND CIRCULAR.

MONSIEUR.—L'argumentation serrée et correcte de M. W. C. Collins (*voy Medical Press and Circular* de Juillet 27th) rend si difficile le rôle de la réplique, qu'il me sera impossible de la faire complète. Il soulève, en effet, après avoir écarté les autres propositions au sujet desquelles notre accord semble parfait, la question de savoir si le vaccin animal (calf lymph) préserve de la petite vérole, et nous demande de le prouver. Jenner s'était prononcé dans l'autre sens, vraisemblablement, mais sans le dire explicitement, après avoir procuré la variole à des sujets ainsi vaccinés, et M. Collins nous demande si, à ces faits positifs, nous en avons à opposer d'autres que de négatifs.

Nous devons convenir que non. Jenner vivait à une époque où l'on pouvait faire *in anima vili* l'expérience de la variolation; aujourd'hui l'on ne le peut plus. Notre seul moyen de contrôle direct consiste à revacciner les sujets déjà imprégnés un première fois et à constater le résultat de ces revaccinations. A cet égard, notre conviction est faite, et elle se fonde bien, dans ces limites, sur des faits positifs.

Mais il ne nous est pas permis d'assimiler une vaccination à l'essai livré à l'espèce humaine par la variole, surtout quand elle existe à l'état épidémique. L'expérience n'est donc pas complète, et nous le reconnaissons avec la plus entière franchise.

Et c'est pour cela que nous appelons l'enquête sur ce point si important. J'ai terminé ma note du 21 Juin 1881 par ces mots: "Depuis seize ans que la plupart des vaccinations et des revaccinations se font, en Belgique, par notre vaccin, pas un seul des sujets ainsi imprégnés ne nous a été signalé comme ayant été atteint de la variole." Qu'on nous comprenne bien, nous n'avons pu vouloir parler et n'avons parlé qu'au sujet des sujets ayant été vaccinés ou revaccinés plus ou moins récemment avec succès.

Et nous avons fait à cet égard la sollicitation que voici à l'Académie royale de médecine de Belgique, dans la séance du 30 Mars 1879: "J'ai dit précédemment qu'aucun cas semblable ne m'avait été signalé. Je le répète, et jusqu'ici aucun des nombreux médecins que j'ai interrogés à ce sujet ne m'a contredit. N'y en a-t-il pas eu? Cela me semble impossible. Quoi qu'il en soit, je fais appel à M.M. les médecins des hôpitaux et de l'assistance publique pour éclaircir ce fait qui, à raison des déductions auxquelles il conduit, demande à être sévèrement vérifié."

Cet appel est resté et demeure encore sans réponse. Ce n'est là, c'est bien vrai, qu'un fait négatif, mais qui donc voudrait en méconnaître la haute signification?

Les choses en sont là. Aujourd'hui, M. Collins signale, au courant de la plume, "two cases in which fatal small-pox followed vaccination with calf lymph." Le cas est grave, mais il vaudra nous permettre d'attendre, avant d'y attacher quel qu'importance, la relation complète de ces deux cas malheureux. Cette relation devra établir:

1. Que les sujets n'étaient pas déjà en puissance de variole quand la vaccination a été pratiquée.
2. Que celle-ci était de date récente et avait été suivie d'un succès incontestable.

Et quand cela aura été bien établi, on aura simplement acquis la preuve que la vaccination animale est passible de défaillances comme la vaccination humaine. Ce sera un fleuron de moins à sa couronne, pas autre chose.

M. Collins, après avoir rappelé travaux, de M. Creighton, tendant à établir que la tuberculose, bovine peut se transmettre à l'homme par l'usage du lait du vache, fait observer avec beaucoup de raison que la possibilité de transmettre cette diathèse par le moyen de la lymphé inflammatoire d'une vesicule vaccinale n'en reste par moins à démontrer.

Rien n'est plus juste. Il faut noter, en effet, que les transmissions directes de la tuberculose—autre que l'immense majorité d'entre elles sont sujettes à caution—ont été

obtenues par l'inoculation de la matière tuberculeuse seule. A notre connaissance, on n'a jamais, n'importe où, parlé de la transmission obtenue à l'aide du sérum d'un animal tuberculeux. Il faudrait donc se rejeter sur l'inoculabilité de la tuberculeuse constitutionnelle. Or, il n'existe absolument aucun fait—nous disons aucun—ni aucune preuve à l'appui d'une transmission de cette nature.

M. Collins termine en demandant qu'en Angleterre, où la loi concernant la vaccination est si rigoureuse, la matière employée soit pure dans sa source, inoffensive et préservatrice. Le vaccin de veau répond à ces trois conditions, et si, au point de vue de la durée de la préservation, il pouvait rester du doute, l'expérience belge dès à présent acquise nous paraît de nature à le réduire à de bien faibles proportions.

DOCTEUR WARLDMONT.

Bruxelles, 28 Juillet 1881.

THE ORIGIN OF VACCINIA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

18.—There are so many assertions made about the origin of vaccinia that I am convinced that most of your readers have not seen (as it is a rare work) Mr. R. Coely's "Observations on the Variolæ Vaccinæ," which was published at Worcester in 1840. From notes which I took, when I last had the advantage of conversing with that lamented gentleman at Cambridge, in the autumn of last year, 1880, and from the work above mentioned, I am able to solve some of the points alluded to by your correspondent of July 27.

1. Vaccination of the cow with humanised lymph was often practised by Mr. Coely (p. 70) with perfect success. "Sometimes every puncture succeeded." This is surely a sufficient reply to one of your correspondents, who alleges that it is extremely difficult to get retro-vaccination to succeed.

2. Affinity of cow-pox and small-pox.—Coely noted (p. 94) that cow-pox occurred when variola was prevalent. This had been stated before by Dr. Sunderland (*Med. Gaz.*, Nov. 9, 1831), and has recently been re-stated by Professor Simmonds at the debate on vaccination in 1880. On February 1st, 1839, Coely inoculated three sturks with small-pox virus of the 7th or 8th day, on large points—the teeth of a comb—charged twelve hours previously. The sturks were about ten months old. In the case of the first of these animals, seven punctures were made near the left side of the vulva, and fourteen points inserted. This experiment was not a decisive one. In the second sturk, seven punctures were inoculated near the left side of the vulva with fourteen points. On February 15th this animal was re-inoculated with small-pox on the left side of the vulva. On the third day after this there was nothing remarkable seen; but on the 5th the four upper punctures became enlarged and elevated, and, on the sixth day, all presented the appearance of vaccine vesicles. The third experiment was a failure. No eruption was noticed on the animals as resulting from the inoculation with variola on them.

"The lymph taken from the vesicles in experiment 2 (p. 111) on the different days was used with different degrees of effect; but when successful, produced perfect vaccine vesicles."

3. Effects of the lymph. Mr. Coely quotes (p. 118) from the *Quarterly Journal of Medical Science of Calcutta*, 1837, how that, in one case a vaccine disease from cows in Tilhet had ultimately turned into variola, and his anxiety was increased for a time by the fact that his assistant, Mr. Taylor, had punctured his finger when opening the variolous pustula in the first experiment. On the 5th day a papulo-vesicular eruption appeared at the part, and then papulis on the face, which reached their acme on the 6th day. There were slight vesicles with straw-coloured summit. Mr. Coely calls this modified vaccine, with roseol and vaccine lichen, and most vaccinators have seen many cases of this kind. The lymph taken from the second experiment was inoculated on the arms of four subjects, and these succeeded. Mr. Coely says, "In no adults, except in the case of my assistant, Mr. Taylor, was there any attendant eruption; nor in any child the slightest approach to anything of a varioloid character. Roseola, stropulus, lichen, were the principal eruptions" (p. 138) and, he continues, "The effects of the lymph have been well observed at Cheltenham, where it has been extensively used by Mr. Coles and many other surgeons. It was in use many months at the Small-Pox and Vaccination Hospital in London; and it has been attentively observed at Bristol by Mr. Keim, also at the Cow-Pox Institution of Dublin, and by many private practitioners."

Mr. Coely mentions (p. 140) that Dr. Thiele, of Kasan, in Russia, had been successful in the same way in 1836. He selected milk cows and inoculated the udder with variola (*British and Foreign Medical Review*). Mr. Badoock, late of Brighton (still alive), did the same, and Dr. Greene, of Birmingham, also.

I don't understand how the negative experiments of the Lyons physicians or others can set aside these positive experiments. But I do affirm that it is time that fresh experiments on a large scale were made in this country to set the matter at rest. Until that is done, we shall have continual uncertainty as to how it is that vaccinia preserves from variola, and all sorts of assertions about its origin, which will be merely hypotheses.

I am, sir,

Your obedient servant,
C. R. DEBDALE, M.D.

17 Woburn Place, W.C., London, July 28, 1881.

Medical News.

University of London.—The following candidates have passed the first M.B. Examination:—

FIRST DIVISION.

Black, Robert
Cave, Edward John
Dane, Louis Albert
Gordon, Edward
Gostling, William Ayton, B.Sc.
Grayling, Arthur
Hind, Wheelton
Horrocks, William Henry
Hull, Walter
Jones, John Harvey
Lawrence, Laurie Asher
Martin, Albert

Merrifield, Sydney Sargent
Perez, George Victor
Prideaux, Frances Helen
Reynolds, Ernest Septimus
Roughton, Edmund Wilkinson
Scharlieb, Mary Ann Dacomb
Shore, Thomas William, B.Sc.
Targett, James Henry
Thomson, Theodore
Thorburn, William, B.Sc.
Wilson, Thomas
Womack, Frederick, B.Sc.

SECOND DIVISION.

Bailey, Charles Frederick
Bennett, Frederick William
Black, William Jones
Brown, Arthur Thomas
Brown, William Henry
Caiger, Frederick Foord
Carnaley, Matthew
Champ, John Howard
Cook-y, Edmund Percival
Cuff, Robert
Dudley, William
Evans, William Arnold
Evans, Willmott Henderson, B.Sc.
Fletcher, John
Floyer, William Wadham
Glover, John Philip
Green, Charles David

Hewer, Joseph Langton
Hill, George William
Knight, Frederick
Maugham, James
Meyer, Charles Hartvig Lomo
Milton, Herbert Meyrick Nelson
O'Kane, Michael
Paley, Frederick John
Parry-Jones, Maurice
Powell, John Joseph
Short, Thomas Sydney
Slater, Drues John
Spencer, Herbert Ethelie
Tomlinson, Emily
Turner, Alfred Jeffers
Vann, Alfred Mason
Wemyss, Edwin James, B.A., B.Sc.

SECOND DIVISION—EXCLUDING PHYSIOLOGY.

Grose, Charles
Hart, Herbert Wheatley
Marriner, William Herbert Lister

Shillito, Henry
Tilly, Alfred

FIRST DIVISION—PHYSIOLOGY ONLY.

Dent, Harry Lord Richards

SECOND DIVISION.

Fox, Robert Fortescue
Parry, Robert

Richmond, Charles Ernest

University of Edinburgh.—The following candidates received the Degree of Doctor of Medicine:—

Adam, John, M.A. Edin.
Alexander, Reginald Gervaise, M.A., Cantab.
Clarke, Henry Joy, M.B. and C.M.
Clouston, Charles Stewart, M.B. and C.M.
Coille, David, M.B. and C.M.
Coldstream, Alexander Robert, M.B. and C.M.
Cox, Joshua John, M.B.
Davison, James Thomas Richard, M.B. and C.M.
Deverell, Henry George, M.B. and C.M.
Douglas, Charles Edward, M.B. and C.M.
Gibson, George Alex., B.Sc. Edin.
Hay, Matthew, M.H. and C.M.
Lamb, William, M.B. and C.M.
Lawson, Robert, M.B. and C.M.
Low, Alexander Bruce, M.B. and C.M.
M'Brice, Peter, M.B. and C.M.
Macnaughton, William Alexander, M.A. Edin.
M'Donald, Duncan, B.Sc. Edin.

M'Neill, Roger, M.B. and C.M.
Miller, William Birkmyre, M.B. and C.M.
Moodie, Robert, M.B. and C.M.
Murray, James, M.B. and C.M.
Oram, Arthur M., M.B. and C.M.
Oswald, Henry Robert, M.B. and C.M.
Pountney, William Edward, M.B. and C.M.
Shaw, Oliver Cromwell, M.B. and C.M.
Sanctuary, Thomas, M.B., 1878
Smith, Andrew, M.B.
Thomson, David George, M.B. and C.M.
Trotter, Leslie Batten, M.B. and C.M.
Turner, William, M.B. and C.M.
Williams, William Henry, M.B. and C.M.
Williamson, Robert Lamley, M.B. and C.M.
Wilson, John, M.B. and C.M.
Woodhead, German Sims, M.B. and C.M.

School of Medicine for Women.—A garden party was given at the School of Medicine for Women on Friday afternoon. An excellent band was in attendance. The gardens of the School were very prettily decorated, and a large number of eminent medical men, both British and foreign, were present.

NOTICES TO CORRESPONDENTS.

CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the *Medical Press and Circular*, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

LOCAL REPORTS AND NEWS.—Correspondents desirous of drawing attention to these, are requested kindly to mark the newspapers when sending them to the Editor.

IRISH MEDICAL DIRECTORY, 1882.—We are asked to announce that all those who have received the annual circular will very much oblige by its *immediate* return whether any corrections be required or not, both to ensure correctness and to save the Editor much unnecessary expense and trouble.

DR. N. K.—It was not sent by us, but we will utilise the matter in an early number.

MR. M. H. J.—Received too late to be of any service.

A NOVEL PLEA.—On July 1st a firm of Calcutta undertakers was proceeded against for debt, and the sole reason pleaded by the attorney for delaying payment was the scarcity of interments. "If," said he, "people did not die faster than they were then doing, how could his clients live?" We were scarcely prepared to hear of such a state of extreme healthiness in Calcutta, but are nevertheless rejoiced if it be so.

QUACKERY.—A correspondent sends us a local paper in which the advertiser, a Mr. G. M. Dorman, offers advice to the public on the ground that "he has fortunately come into the possession of the secret of mixing certain most valuable and powerful medicines." Our opinion is, that a man who attempts to deceive the public thus should be at once prosecuted by his college.

A MEDICAL STUDENTS' CLUB FOR DUBLIN.

To the Editor of the Medical Press and Circular.

DEAR SIR,—Would you be so kind as to permit me, through the medium of your most worthy columns, to give rise to a want that is much felt by medical students, especially in such cities as Dublin.

It is a movement I am sure that will meet and be approved of by every one that is concerned in the welfare of the medical students, and I am confident will be supported by all of them.

We hear every day of clubs and societies being formed for different trades and professions but it has come to this date of the world without having one formed for the benefit of medical students where they might go and spend their leisure hours instead of traversing the streets from end to end and thereby exposing themselves to every temptation.

I am not sufficiently experienced to dwell on this subject, but I hope that a move may meet the eyes of those in whose power it lies to aid such a movement.

Yours, &c.,

A BEGINNER.

[The suggestion of our correspondent is worthy of careful consideration. It is, without doubt, a very unsatisfactory state of things that the student, after his day's work is over, has no resort but either his own uninviting lodgings, or else the streets of the city, the billiard-room, or perhaps the public-house. Those who expect that a student will go home every evening to doze over a book and regale himself with a solitary and comfortless cup of tea, look for too much virtue from the average student, and we assert that a serious responsibility rests upon the system which provides no more rational and respectable enjoyment for the student than his lodgings afford, and which drives him into the streets with all their allurements and dangers. But the remedy which our correspondent suggests is extremely difficult of attainment. A medical student's club would inevitably degenerate and die if it did not fulfil certain requirements: firstly, it must be managed with all the firmness of university discipline, and any ebullition of rowdiness must be at once repressed or visited with expulsion; secondly, it must be absolutely independent of the association or influence of any particular school, grinder, or clique, and perfectly free to all well-conducted students; thirdly, it must be perfectly unsectarian; and fourthly, its management must be thoroughly judicious, neither lax nor over rigid, nor goody-goody. As to the method by which a scheme so desirable might be realised, we suggest that a committee might be constructed by the election of (say) three representative student delegates from each of the five schools, the establishment being managed by a warden, and, to a certain extent, controlled by a governing board made up of one of the responsible teachers from each of the schools. The aspiration may, perhaps, be considered as visionary as Dr. Richardson's "Hygeia," but if leaders amongst the teachers were impressed with the fact that their duty towards the student and the student's guardian included something more than the taking of his money and cramming into him a certain *quantity* of medicine and surgery, we might not be so far from its realisation.—ED.]

PRACTICAL CHRISTIANITY IN THE PROFESSION.—Last week, after the capping ceremony at the University of Edinburgh, Prof. Annandale delivered an instructive address on "Quackery," which he wound up with such a common-sense view of the relations of medicine to religion, that we are happy to endorse and to reproduce it: "Specially in your walk in life," said he, "avoid theological discussions and politics. All of you have, I trust, confidence in some form of Christian religion, and what I would say to you is, support your own form of belief and everything connected with it to the best of your means; sympathise with and aid your own clergyman, and all other clergymen of whatever denomination, for our profession and theirs can do much and good work in common; be at all times tolerant to the religious opinions and feelings of others, and keep in remembrance one great principle of the Christian religion, 'Let brotherly love continue.'"

MY LIVER.

AN American correspondent sends us the following:—

What makes this world so drear and sad?
Why am I never, never glad?
What is it drives me nearly mad?—
My liver!

Why do I moan and sob and sigh,
And wish—ah! wish—that I might die!
Why would I pass from earth? oh! why?
My liver!

What is it on my breath doth seize;
Then comes in form of cough and wheeze;
Then makes me think I've Bright's disease?
My liver!

Whence is this spinning in my head?
Why are my pulses almost dead?
Why doth my stomach feel like lead?
My liver!

What makes me sausage eschew,
And buckwheat-cakes, and mince-pies, too,
And ev'rything that's nice? Boo-hoo?—
My liver!

What is it, day and night intent
On every sort of devilment,
Loth all the ills to me present?—
My liver!

Vacancies.

Beeth Union, Yorks.—Medical Officer for the Winkler District. Salary, £40, with extra fees. Applications to the Clerk to the Guardians before Aug. 17.
Brighton and Hove Dispensary.—Resident House Surgeon. Salary, £140. Applications to the Hon. Sec. by September 5.
Leeds General Infirmary.—House Surgeon. Salary, £100, with board. Applications to Dr. Clifford Albutt, Leeds, by Aug. 18.
Macclesfield Infirmary. Senior House Surgeon. Salary commencing at £100, with board. Applications to the Chairman by Aug. 13.
North Stafford Infirmary, Stoke-on-Trent.—House Surgeon. Salary, £120. House Physician. Salary, £100. Each with board. Applications to the Secretary before August 17.
Sussex County Hospital, Brighton.—House Surgeon. Salary, £20, with board, and fees additional from pupils. Applications to the Secretary before Aug. 24.

Births.

BURROUGHS.—Aug. 1, at St. Etienne, Loire, the wife of Hastings Burroughs, L.E.C.S.I., &c., of a son.
PHIPPS.—Aug. 8, at Clairville, Manchester, the wife of G. C. Phipps, M.D., F.R.C.S.E., of a daughter.
REYNOLDS.—Aug. 8, at 7 Spencer Terrace, Kilmainham, the wife of Surgeon-Major Reynolds, V.C., of a son.

Marriages.

KNOTT—BALCOMBE.—Aug. 4, at St. Peter's Church, Dublin, John Freeman Knott, F.R.C.S.I., of 34 York Street, Dublin, to Philippa Annie, eldest daughter of Lieut.-Colonel Balcombe, of 1 Marine Crescent, Clontarf.

Deaths.

ANDERSON.—July 23, at Mountingent House, near Johnswell, R. H. Anderson, M.D., aged 68.
BURKE.—Aug. 2, at his father's residence, Queenstown, Castle Dalkey, Dr. Burke, aged 31.
BURTON.—Aug. 1, at 48 Rich Terrace, Richmond Road, West Brompton, Thomas Beard Burton, M.R.C.S., aged 38.
COLAHAN.—July 31, at 7 Castle Avenue, Clontarf, Patrick J. Colahan, M.D.
FORSTH.—July 25, William Forstth, L.R.C.P., L.E.C.S., of 113 St. Martin's Lane, Charing Cross, aged 69.
GEORGE.—Aug. 4, at Surbiton, Caroline, widow of Edward George, M.D., late of Sandgate, Kent, aged 78.
HAYMAN.—July 26, at Ramsgate, Philip Charles Hayman, M.R.C.S., formerly of Axminster, Devon.
HENDERSON.—July 20, at Cranfield, Great Malvern, Emily, the wife of Andrew Henderson, M.R.C.S., of Great Malvern.
KELLY.—Aug. 2, at his residence, The Gardens, Peckham Rye, Surgeon-Major J. P. Kelly, Retired List Bengal Army, aged 61.
LAXON.—Aug. 1, at Coventry, Elizabeth, widow of W. Laxon, M.D. M.R.C.P., aged 82.
PERN.—Aug. 2, at Botley, Southampton, Harriette, wife of Alfred Pern, F.R.C.S., aged 33.
WILLIS.—Aug. 4, at Hove, Brighton, Thomas Willis, M.D. Cantab, M.R.C.P. Lond., aged 77.

The International Medical Congress.

THE CONNECTION OF THE BIOLOGICAL SCIENCES WITH MEDICINE. (a)

By Professor HUXLEY, LL.D., F.R.S., Secretary to the Royal Society, and Vice-President of the Congress.

THE great body of theoretical and practical knowledge which has been accumulated by the labours of some eighty generations, since the dawn of scientific thought in Europe, has no collective English name to which an objection may not be raised; and I use the term "medicine" as that which is least likely to be misunderstood; though, as every one knows, the name is commonly applied, in a narrower sense, to one of the chief divisions of the totality of medical science.

Taken in this broad sense, "medicine" not merely denotes a kind of knowledge, but it comprehends the various applications of that knowledge to the alleviation of the sufferings, the repair of the injuries, and the conservation of the health of living beings. In fact, the practical aspect of medicine so far dominates over every other that the "healing art" is one of its most widely received synonyms. It is so difficult to think of medicine otherwise than as something which is necessarily connected with curative treatment, that we are apt to forget that there must be, and is, such a thing as a pure science of medicine—a "pathology" which has no more necessary subservience to practical ends than has zoology or botany.

The logical connection between this purely scientific doctrine of disease, or pathology, and ordinary biology is easily traced. Living matter is characterised by its innate tendency to exhibit a definite series of the morphological and physiological phenomena which constitute organisation and life. Given a certain range of condition, and these phenomena remain the same, within narrow limits, for each kind of living thing. They furnish the normal and typical characters of the species; and, as such, they are the subject-matter of ordinary biology.

(a) The closing Address of the International Medical Congress, delivered in St. James's Hall, Tuesday, August 9th.

Outside the range of these conditions, the normal course of the cycle of vital phenomena is disturbed, abnormal structure makes its appearance, or the proper character and mutual adjustment of the functions cease to be preserved. The extent and the importance of these deviations from the typical life may vary indefinitely. They may have no noticeable influence on the general well-being of the economy, or they may favour it. On the other hand, they may be of such a nature as to impede the activities of the organism, or even to involve its destruction.

In the first case, these perturbations are arranged under the wide and somewhat vague category of "variations;" in the second, they are called lesions, states of poisoning, or diseases; and, as morbid states, they lie within the province of pathology. No sharp line of demarcation can be drawn between the two classes of phenomena. No one can say where anatomical variations end and tumours begin, nor where modification of function, which may at first promote health, passes into disease. All that can be said is, that whatever change of structure or function is hurtful belongs to pathology. Hence it is obvious that pathology is a branch of biology; it is the morphology, the physiology, the distribution, the stiology of abnormal life.

However obvious this conclusion may be now, it was no-wise apparent in the infancy of medicine. For it is a peculiarity of the physical sciences, that they are independent in proportion as they are imperfect; and it is only as they advance that the bonds which really unite them all become apparent. Astronomy had no manifest connection with terrestrial physics before the publication of the "Principia;" that of chemistry with physics is of still more modern revelation; that of physics and chemistry with physiology has been stoutly denied within the recollection of most of us, and perhaps still may be.

Or, to take a case which affords a closer parallel with that of medicine. Agriculture has been cultivated from the earliest times; and, from a remote antiquity, men have attained considerable practical skill in the cultivation of the useful plants, and have empirically established many scientific truths concerning the conditions under which they flourish. But it is within the memory of many of us that chemistry, on the one hand, and vegetable physiology on the other, attained a stage of development such that they were able to furnish a sound basis for scientific agriculture. Similarly, medicine took its rise in the practical needs of

mankind. At first, studied without reference to any other branch of knowledge, it long maintained—indeed, still to some extent maintains—that independence. Historically, its connection with the biological sciences has been slowly established, and the full extent and intimacy of that connection are only now beginning to be apparent. I trust I have not been mistaken in supposing that an attempt to give a brief sketch of the steps by which a philosophical necessity has become an historical reality may not be devoid of interest, possibly of instruction, to the members of this great Congress, profoundly interested as all are in the scientific development of medicine.

The history of medicine is more complete and fuller than that of any other science, except, perhaps, astronomy; and if we follow back the long record as far as clear evidence lights us, we find ourselves taken to the early stages of the civilisation of Greece. The oldest hospitals were the temples of *Æsculapius*; to these *Asclepeia*, always erected on healthy sites, hard by fresh springs, and surrounded by shady groves, the sick and the maimed resorted to seek the aid of the god of health. Votive tablets or inscriptions recorded the symptoms, no less than the gratitude, of those who were healed; and from these primitive clinical records the half priestly, half philosophic caste of the *Asclepiads* compiled the data upon which the earliest generalisations of medicine as an inductive science were based.

In this state pathology, like all the inductive sciences at their origin, was merely natural history; it registered the phenomena of disease, classified them, and ventured upon a prognosis wherever the observation of constant co-existences and sequences suggested a rational expectation of the like recurrence under similar circumstances.

Further than this it hardly went. In fact, in the then state of knowledge, and in the condition of philosophical speculation at that time, neither the causes of the morbid state nor the *rationalis* of treatment were likely to be sought for as we seek for them now. The anger of a god was a sufficient reason for the existence of a malady, and a dream ample warranty for therapeutic measures; that a physical phenomenon must needs have a physical cause was not the implied or expressed axiom that it is to us moderns.

The great man whose name is inseparably connected with the foundation of medicine, Hippocrates, certainly knew very little—indeed, practically nothing—of anatomy or physiology; and he would probably have been perplexed, even to imagine the possibility of a connection between the zoological studies of his contemporary, Democritus, and medicine. Nevertheless, in so far as he, and those who worked before and after him in the same spirit, ascertained, as matters of experience, that a wound or a luxation or a fever presented such and such symptoms, and that the return of the patient to health was facilitated by such and such measures, they established laws of nature, and began the construction of the science of pathology. All true science begins with empiricism—though all true science is such exactly in so far as it strives to pass out of the empirical stage into that of the deduction of empirical from more general truths. Thus, it is not wonderful that the early physicians had little or nothing to do with the development of biological science; and, on the other hand, that the early biologists did not much concern themselves with medicine. There is nothing to show that the *Asclepiads* took any prominent share in the work of founding anatomy, physiology, zoology, and botany. Rather do these seem to have sprung from the early philosophers, who were essentially natural philosophers animated by the characteristically Greek thirst for knowledge as such. Pythagoras, Alcmeon, Democritus, Diogenes (of Appollonia), are all credited with anatomical and physiological investigation; and though Aristotle is said to have belonged to an *Asclepiad* family, and not improbably owed his taste for anatomical and zoological inquiries to the teachings of his father, the physician Nichomachus, the "*Historia Animalium*," and the treatise "*De Partibus Animalium*," are as free from from any allusion to medicine as if they had issued from a modern biological laboratory.

It may be added, that it is not easy to see in what way it could have benefited a physician of Alexander's time to know all that Aristotle knew on these subjects. His human anatomy was too rough to avail much in diagnosis, his physiology was too erroneous to supply data for pathological reasoning. But when the Alexandrian School, with Erasistratus and Herophilus at their head, turned to account

the opportunities of studying human structure, afforded to them by the Ptolemies, the value of the large amount of accurate knowledge thus obtained to the surgeon for his operations, and to the physician for his diagnosis of internal disorders, became obvious, and a connection was established between anatomy and medicine, which has ever become closer and closer. Since the revival of learning, surgery, medical diagnosis, and anatomy have gone hand in hand. Morgagni called his great work, "*De Sedibus et Causis Morborum per Anatomen indagatis*," and not only showed the way to search out the localities and the causes of disease by anatomy, but himself travelled wonderfully far upon the road. Bichat, discriminating the grosser constituents of the organs and parts of the body one from another, pointed out the direction which modern research must take; until, at length, histology, a science of yesterday, as it seems to many of us, has carried the work of Morgagni as far as the microscope can take us, and has extended the realm of pathological anatomy to the limits of the invisible world.

Thanks to the intimate alliance of morphology with medicine, the natural history of disease has, at the present day, attained a high degree of perfection. Accurate regional anatomy has rendered practicable the exploration of the most hidden parts of the organism, and the determination during life of morbid changes in them; anatomical and histological post-mortem investigations have supplied physicians with a clear basis upon which to rest the classification of diseases, and with unerring tests of the accuracy or inaccuracy of their diagnoses.

If men could be satisfied with pure knowledge, the extreme precision with which, in these days, a sufferer may be told what is happening, and what is likely to happen, even in the most recondite parts of his bodily frame, should be as satisfactory to the patient as it is to the scientific pathologist who gives him the information. But I am afraid it is not; and even the practising physician, while nowise underestimating the regulative value of accurate diagnosis, must often lament that so much of his knowledge rather prevents him from doing wrong than helps him to do right.

A scooner of physic once said that nature and disease may be compared to two men fighting, the doctor to a blind man with a club, who strikes into the *milie*, sometimes hitting the disease, and sometimes hitting nature. The matter is not amended if you suppose the blind man's hearing to be so acute that he can register every stage of the struggle, and pretty clearly predict how it will end. He had better not meddle at all until his eyes are opened, until he can see the exact position of the antagonists, and make sure of the effect of his blows. But that which it behoves the physician to see, not indeed with his bodily eye, but with clear intellectual vision, is a process, and the chain of causation involved in that process. Disease, as we have seen, is a perturbation of the normal activities of a living body; and it is, and must remain, unintelligible so long as we are ignorant of the nature of these normal activities. In other words, there could be no real science of pathology until the science of physiology had reached a degree of perfection unattained, and indeed unattainable, until quite recent times.

So far as medicine is concerned, I am not sure that physiology, such as it was down to the time of Harvey, might as well not have existed. Nay, it is perhaps no exaggeration to say that within the memory of living men, justly renowned practitioners of medicine and surgery knew less physiology than is now to be learned from the most elementary textbook; and, beyond a few broad facts, regarded what they did know as of extremely little practical importance. Nor am I disposed to blame them for this conclusion; physiology must be useless, or worse than useless, to pathology, so long as its fundamental conceptions are erroneous.

Harvey is often said to be the founder of modern physiology; and there can be no question that the elucidations of the function of the heart, of the nature of the pulse, and of the course of the blood, put forth in the ever-memorable little essay "*Du Motu Cordis*," directly worked a revolution in men's views of the nature and of the concatenation of some of the most important physiological processes among the higher animals; while, indirectly, their influence was perhaps even more remarkable.

But, though Harvey made his signal and perennially important contribution to the physiology of the moderns, his general conception of vital processes was essentially identical with that of the ancients; and, in the "*Exercitationes de*

Generations," and notably in the singular chapter "De Calido Innato," he shows himself a true son of Galen and of Aristotle.

For Harvey, the blood possesses powers superior to those of the elements; it is the seat of a soul which is not only vegetative, but also sensitive and motor. The blood maintains and fashions all parts of the body, "idque summâ cum providentia et intellectu, in finem certum agens, quasi ratiocinio quodam uteretur."

Here is the doctrine of the "pneuma," the product of the philosophical mould into which the animism of primitive men ran in Greece, in full force. Nor did its strength abate for long after Harvey's time. The same ingrained tendency of the human mind to suppose that a process is explained when it is ascribed to a power of which nothing is known except that it is the hypothetical agent of the process, gave rise in the next century to the animism of Stahl; and, later, to the doctrine of a vital principle, that "asylum ignorantie" of physiologists, which has so easily accounted for everything and explained nothing, down to our own times.

Now, the essence of modern, as contrasted with ancient, physiological science, appears to me to lie in its antagonism to animistic hypotheses and animistic phraseology. It offers physical explanations of vital phenomena, or frankly confesses that it has none to offer. And, so far as I know, the first person who gave expression to this modern view of physiology, who was bold enough to enunciate the proposition that vital phenomena, like all the other phenomena of the physical world, are, in ultimate analysis, resolvable into matter and motion, was René Descartes.

The fifty-four years of life of this most original and powerful thinker are widely overlapped on both sides by the eighty of Harvey, who survived his younger contemporary by seven years, and takes pleasure in acknowledging the French philosopher's appreciation of his great discovery.

In fact, Descartes accepted the doctrine of the circulation as propounded by "Hervæus, medecin d'Angleterre," and gave a full account of it in his first work—the famous "Discours de la Méthode"—which was published in 1637, only nine years after the exertion "De Motu Cordis;" and, though differing from Harvey in some important points (in which, it may be noted in passing, Descartes was wrong and Harvey right), he always speaks of him with great respect. And so important does the subject seem to Descartes, that he returns to it in the "Traité des Passions," and in the "Traité de l'Homme."

It is easy to see that Harvey's work must have had a peculiar significance for the subtle thinker, to whom we owe both the spiritualistic and the materialistic philosophies of modern times. It was in the very year of its publication, 1628, that Descartes withdrew into that life of solitary investigation and meditation of which his philosophy was the fruit. And, as the course of his speculation led him to establish an absolute distinction of nature between the material and the mental worlds, he was logically compelled to seek for the explanation of the phenomena of the material world within itself; and having allotted the realm of thought to the soul, to see nothing but extension and motion in the rest of nature. Descartes uses "thought" as the equivalent of our modern term "consciousness." Thought is the function of the soul, and its only function. Our natural heat, and all the movements of the body, says he, do not depend on the soul. Death does not take place from any fault of the soul, but only because some of the principal parts of the body become corrupted. The body of a living man differs from that of a dead man in the same way as a watch or other automaton (that is to say, a machine which moves of itself), when it is wound up, and has in itself the physical principle of the movements which the mechanism is adapted to perform, differs from the watch, or other machine, when it is broken, and the physical principle of its movement no longer exists. All the actions which are common to us, and the lower animals depend only on the conformation of our organs and the course which the animal spirits take in the brain, the nerves, and the muscles; in the same way as the movement of a watch is produced by nothing but the force of its spring and the figure of its wheels and other parts.

Descartes' treatise on man is a sketch of human physiology in which a bold attempt is made to explain all the phenomena of life, except those of consciousness, by physical reasonings. To a mind turned in this direction, Harvey's exposition of the heart and vessels as a hydraulic mechanism must have been supremely welcome.

Descartes was not a mere philosophical theorist, but a hard-working dissector and experimenter, and he held the strongest opinion respecting the practical value of the new conception which he was introducing. He speaks of the importance of preserving health, and of the dependence of the mind on the body being so close that perhaps the only way of making men wiser and better than they are, is to be sought in medical science. "It is true," says he, "that as medicine is now practised, it contains little that is very useful; but, without any desire to depreciate, I am sure that there is no one, even among professional men, who will not declare that all we know is very little as compared with that which remains to be known; and that we might escape an infinity of diseases of the mind, no less than of the body, and even, perhaps, from the weakness of old age, if we had a sufficient knowledge of their causes, and of all the remedies with which nature has provided us." (a) So strongly impressed was Descartes with this, that he resolved to spend the rest of his life in trying to acquire such a knowledge of nature as would lead to the construction of a better medical doctrine. (b) The anti-Cartesians found material for cheap ridicule in these aspirations of the philosopher; and it is almost needless to say that, in the thirteen years which elapsed between the publication of the "Discours" and the death of Descartes, he did not contribute much to their realisation. But, for the next century, all progress in physiology took place along the lines which Descartes laid down.

The greatest physiological and pathological work of the seventeenth century—Boerll's treatise "De Motu Animalium"—is, to all intents and purposes, a development of Descartes' fundamental conception; and the same may be said of the physiology and pathology of Boerhaave, whose authority dominated in the medical world of the first half of the eighteenth century.

With the origin of modern chemistry, and of electrical science, in the latter half of the eighteenth century, aids in the analysis of the phenomena of life, of which Descartes could not have dreamed, were offered to the physiologist. And the greater part of the gigantic progress which has been made in the present century is a justification of the prevision of Descartes. For it consists, essentially, in a more and more complete resolution of the grosser organs of the living body into physico-chemical mechanisms.

"I shall try to explain our whole bodily machinery in such a way, that it will be more necessary for us to suppose that the soul produces such movements as are not voluntary, that it is to think that there is in a clock a soul which causes it to show the hours." (c) These words of Descartes might be appropriately taken as a motto by the author of any modern treatise on physiology.

But though, as I think, there is no doubt that Descartes was the first to propound the fundamental conception of the living body as a physical mechanism, which is the distinctive feature of modern, as contrasted with ancient physiology, he was misled by the natural temptation to carry out, in all its details, a parallel between the machines with which he was familiar, such as clocks and pieces of hydraulic apparatus, and the living machine. In all such machines there is a central source of power, and the parts of the machine are merely passive distributors of that power. The Cartesian school conceived of the living body as a machine of this kind; and herein they might have learned from Galen, who, whatever ill-use he may have made of the doctrine of "natural faculties," nevertheless had the great merit of perceiving that local forces play a great part in physiology.

The same truth was recognised by Glisson, but it was first prominently brought forward in the Hallerian doctrine of the "vis insita" of muscles. If muscle can contract without nerve, there is an end of the Cartesian mechanical explanation of its contraction by the influx of animal spirits.

The discoveries of Trembley tended in the same direction. In the fresh-water *Hydra* no trace was to be found of that complicated machinery upon which the performance of the functions in the higher animals was supposed to depend. And yet the hydra moved, fed, grew, multiplied, and its fragments exhibited all the powers of the whole. And, finally, the work of Caspar F. Wolff (d), by demonstrating the fact that the growth and development of both plants and animals take

(a) "Discours de la Méthode," 6e partie, ed. Cousin, page 193.

(c) "De la Formation du Fœtus."

(d) "Theoria Generationis," 1759.

place antecedently to the existence of their grosser organs, and are, in fact, the causes, and not the consequences of organisation (as then understood), sapped the foundations of the Cartesian physiology as a complete expression of the vital phenomena.

For Wolff, the physical basis of life is a fluid, possessed of a "vis essentialis" and a "solidascibilitas," in virtue of which it gives rise to organisation; and, as he points out, this conclusion strikes at the root of the whole istro-mechanical system.

In this country the great authority of John Hunter exerted a similar influence, though it must be admitted that the too sibylline utterances which are the outcome of Hunter's struggles to define his conceptions are often susceptible of more than one interpretation. Nevertheless, on some points Hunter is clear enough. For example, he is of opinion that "Spirit is only a property of matter" ("Introduction to Natural History," page 6), he is prepared to renounce animis (*loc. cit.*, page 8), and his conception of life is so completely physical that he thinks of it as something which can exist in a state of combination in the food. "The aliment we take in has in it, in a fixed state, the real life; and this does not become active until it has got into the lungs, for there it is freed from its prison" (Observations on Physiology," page 113). He also thinks that "It is more in accordance with the general principles of the animal machine to suppose that none of its effects are produced from any mechanical principle whatever, and that every effect is produced from an action in the part—which action is produced by a stimulus upon the part which acts, or upon some other part with which this part sympathises, so as to take up the whole action" (*loc. cit.*, page 162).

And Hunter is as clear as Wolff, with whose work he was probably unacquainted, that "whatever life is, it most certainly does not depend upon structure or organisation" (*loc. cit.* page 114).

Of course it is impossible that Hunter could have intended to deny the existence of purely mechanical operations in the animal body. But while, with Borelli and Boerhaave, he looked upon absorption, nutrition, and secretion as operations effected by means of the small vessels, he differed from the mechanical physiologists, who regarded these operations as the result of the mechanical properties of the small vessels, such as the size, form, and disposition of their canals and apertures. Hunter, on the contrary, considers them to be the effect of properties of these vessels which are not mechanical, but vital. "The vessels," says he, "have more of the polypus in them than any other part of the body," and he talks of the "living and sensitive principles of the arteries," and even of the "dispositions or feelings of the arteries." "When the blood is good and genuine the sensations of the arteries, or the dispositions for sensations, are agreeable. . . . It is then they dispose of the blood to the best advantage, increasing the growth of the whole, supplying any losses, keeping up a due succession, &c." (*loc. cit.*, page 123).

If we follow Hunter's conceptions to their logical issue, the life of one of the higher animals is essentially the sum of the lives of all the vessels, each of which is a sort of physiological unit, answering to a polyp; and, as health is the result of the normal "action of the vessels," so is disease an effect of their abnormal action. Hunter thus stands in thought, as in time, midway between Borelli on the one hand, and Bichat on the other.

The acute founder of general anatomy, in fact, outdoes Hunter in his desire to exclude physical reasonings from the realm of life. Except in the interpretation of the action of the sense organs, he will not allow physics to have anything to do with physiology.

"To apply the physical sciences to physiology is to explain the phenomena of living bodies by the law of inert bodies. Now this is a false principle, hence all its consequences are marked with the same stamp. Let us leave to chemistry its affinity, to physics its elasticity and its gravity. Let us invoke for physiology only sensibility and contractility." (a)

Of all the unfortunate dicta of men of eminent ability, this seems one of the most unhappy when we think of what the application of the methods and the data of physics and chemistry has done towards bringing physiology into its present state. It is not too much to say that one-half of a modern text-book of physiology consists of applied physics and chemistry, and that it is exactly in the exploration of the phenomena

of sensibility and contractility that physics and chemistry have exerted the most potent influence.

Nevertheless, Bichat rendered a solid service to physiological process by insisting upon the fact that what we call life in one of the higher animals is not an indivisible unitary archæus, dominating, from its central seat, the parts of the organism, but a compound result of the synthesis of the separate lives of those parts.

"All animals," says he, "are assemblages of different organs, each of which performs its function, and concurs, after its fashion, in the preservation of the whole. They are so many special machines in the general machine which constitutes the individual. But each of these special machines is itself compounded of many tissues of very different natures, which, in truth, constitute the elements of those organs" (*loc. cit.*, lxxix.). "The conception of a proper vitality is applicable only to these simple tissues, and not to the organs themselves" (*loc. cit.* lxxxiv.).

And Bichat proceeds to make the obvious application of this doctrine of synthetic life—if I may so call it—to pathology. "Since diseases are only alterations of vital properties, and the properties of each tissue are distinct from those of the rest, it is evident that the diseases of each tissue must be different from those of the rest. Therefore, in any organ composed of different tissues, one may be diseased and the other remain healthy; and this is what happens in most cases" (*loc. cit.*, lxxv.).

In a spirit of true prophecy, Bichat says "We have arrived at an epoch in which pathological anatomy should start afresh." For as the analysis of the organs had led him to the tissues as the physiological units of the organism, so, in a succeeding generation, the analysis of the tissues led to the cell as the physiological element of the tissues. The contemporaneous study of development brought out the same result, and the zoologists and botanists, exploring the simplest and the lowest forms of animated beings, confirmed the great induction of the cell theory. Thus the apparently opposed views, which have been battling with one another ever since the middle of the last century, have proved to be each half a truth.

The proposition of Descartes, that the body of a living man is a machine, the actions of which are explicable by the known laws of matter and motion, is unquestionably largely true. But it is also true, that the living body is a synthesis of innumerable physiological elements, each of which may nearly be described in Wolff's words, as a fluid possessed of a "vis essentialis," and a "solidascibilitas;" or, in modern phrase, as protoplasm susceptible of structural metamorphosis and functional metabolism; and the only machinery, in the precise sense in which the Cartesian School understood mechanism, is that which co-ordinates and regulates these physiological units into an organic whole.

In fact, the body is a machine of the nature of an army, not of that of a watch, or of a hydraulic apparatus. Of this army, each cell is a soldier; an organ, a brigade; the central nervous system, head-quarters and field-telegraph; the alimentary and circulatory system the commissariat. Losses are made good by recruits born in camp; and the life of the individual is a campaign, conducted successfully for a number of years, but with certain defeat in the long run.

The efficacy of an army, at any given moment, depends on the health of the individual soldier, and on the perfection of the machinery by which he is led and brought into action at the proper time; and therefore, if the analogy holds good, there can be only two kinds of diseases—the one dependent on abnormal states of the physiological units, the other on perturbation of the co-ordinating and alimentative machinery.

Hence the establishment of the cell theory in normal biology was swiftly followed by a "cellular pathology," as its logical counterpart. I need not remind you how great an instrument of investigation this doctrine has proved in the hands of the man of genius to whom its development is due, and who would probably be the last to forget that abnormal conditions of the co-ordinative and distributive machinery of the body are no less important factors of disease.

Henceforward, as it appears to me, the connection of medicine with the biological sciences is clearly defined. Pure pathology is that branch of biology which defines the particular perturbation of cell life, or of the co-ordinating machinery, or of both, on which the phenomena of disease depend.

Those who are conversant with the present state of biology will hardly hesitate to admit that the conception of the life of one of the higher animals as the summation of the lives

(a) "Anatomie Générale," 1., page liv.

of a cell aggregate brought into harmonious action by a co-ordinative machinery formed by some of these cells, constitutes a permanent acquisition of physiological science. But the last form of the battle between the animistic and the physical views of life is seen in the contention whether the physical analysis of vital phenomena can be carried beyond this point or not.

There are some to whom living protoplasm is a substance, even such as Harvey conceived the blood to be, "summâ cum providentia et intellectu in finem certum agens, quasi ratiocinio quodam;" and who look, with as little favour as Bichat did, upon any attempt to apply the principles and the methods of physics and chemistry to the investigation of the vital processes of growth, metabolism, and contractility. They stand upon the ancient ways; only, in accordance with that progress towards democracy which a great political writer has declared to be the fatal characteristic of modern times, they substitute a republic formed by a few billions of "animulæ" for the monarchy of the all-pervading "anima."

Others, on the contrary, supported by a robust faith in the universal applicability of the principles laid down by Descartes, and seeing that the actions called "vital" are, so far as we have any means of knowing, nothing but changes of place of particles of matter, look to molecular physics to achieve the analysis of the living protoplasm itself into a molecular mechanism. If there is any truth in the received doctrines of physics, that contrast between living and inert matter, on which Bichat lays so much stress, does not exist. In Nature, nothing is at rest, nothing is amorphous; the simplest particle of that which men in their blindness are pleased to call "brute matter" is a vast aggregate of molecular mechanisms, performing complicated movements of immense rapidity, and sensitively adjusting themselves to every change in the surrounding world. Living matter differs from other matter in degree and not in kind; the microcosm repeats the macrocosm; and one chain of causation connects the nebulous original of suns and planetary systems with the protoplasmic foundation of life and organisation.

From this point of view, pathology is the analogue of the theory of perturbations in astronomy; and therapeutics resolves itself into the discovery of the means by which a system of forces competent to eliminate any given perturbation may be introduced into the economy. And, as pathology bases itself upon normal physiology, so therapeutics rests upon pharmacology, which is, strictly speaking, a part of the great biological topic of the influence of conditions on the living organism, and has no scientific foundation apart from physiology.

It appears to me that there is no more hopeful indication of the progress of medicine towards the ideal of Descartes than is to be derived from a comparison of the state of pharmacology, at the present day, with that which existed forty years ago. If we consider the knowledge positively acquired, in this short time, of the *modus operandi* of urari, of atropia, of physostigmin, of veratria, of cascæ, of strychnia, of bromide of potassium, of phosphorus, there can surely be no ground for doubting that, sooner or later, the pharmacologist will supply the physician with the means of affecting, in any desired sense, the functions of any physiological element of the body. It will, in short, become possible to introduce into the economy a molecular mechanism, which, like a very cunningly contrived torpedo, shall find its way to some particular group of living elements, and cause an explosion among them, leaving the rest untouched.

The search for the explanation of diseased states in modified cell life; the discovery of the important part played by parasitic organisms in the aetiology of disease; the elucidation of the action of medicaments by the methods and the data of experimental physiology;—appear to me to be the greatest steps which have ever been made towards the establishment of medicine on a scientific basis. I need hardly say they could not have been made except for the advance of normal biology.

There can be no question, then, as to the nature or the value of the connection between medicine and the biological sciences. There can be no doubt that the future of pathology and therapeutics, and therefore that of practical medicine, depend upon the extent to which those who occupy themselves with these subjects are trained in the methods, and impregnated with the fundamental truths of biology.

And, in conclusion, I venture to suggest that the collective sagacity of this Congress could occupy itself with no more

important question than with this. How is medical education to be arranged, so that, without entangling the student in those details of the systematist which are valueless to him, he may be enabled to obtain a firm grasp of the great truths respecting animal and vegetable life, without which, notwithstanding all the progress of scientific medicine, he will still find himself an empiric?

THE GERM THEORY OF DISEASE.

Translation of an Address delivered at the Meeting of the International Medical Congress.

By Professor PASTEUR.

GENTLEMEN,—Two motives have brought me to London. The first was to gain instruction, to profit by your learned discussions; the second was to ascertain the place now occupied in medicine and surgery by the germ theory. Certainly I shall return to Paris well satisfied. During the past week I have learned much, and shall carry away with me the conviction that the English are a great people, and as for the influence of the new doctrine, I have been not only struck by the progress it has made, but by its triumph. I should be guilty of ingratitude and of false modesty if I did not accept the welcome I have received among you and in English society as a mark of homage paid to my labours during the past five-and-twenty years upon the nature of ferments—their life, their nutrition, their preparation in a pure state by the introduction of organisms (*ensemencement*) under natural and artificial conditions—labours which have established the principles and methods of microbism, if the expression is allowable. Your cordial welcome has revived within me the lively feeling of satisfaction I experienced when your great surgeon Lister declared that my publication in 1857 on milk fermentation had inspired him with his first ideas on antiseptic surgery. You have re-awakened the pleasure I felt when our eminent physician Dr. Davaine declared that his labours upon charbon (splenic fever or malignant pustule) had been suggested by my studies on butyric fermentation and the vibron which is characteristic of it. Gentlemen, I am happy to be able to thank you by bringing to your notice a new advance in the study of microbi as applied to the prevention of transmissible diseases—diseases which for the most part are fraught with terrible consequences, both for man and domestic animals. The subject of my communication is vaccination in relation to chicken cholera and splenic fever, and a statement of the method by which we have arrived at these results—a method the fruitfulness of which inspires me with boundless anticipations. Before discussing the question of splenic fever vaccines, which is the most important, permit me to recall the results of my investigations of chicken cholera. It is through this inquiry that new and highly important principles have been introduced into science concerning the virus or contagious quality of transmissible diseases. More than once in what I am about to say I shall employ the expression virus-culture, as formerly, in my investigations on fermentation, I used the expressions, the culture of milk ferment, the culture of the butyric vibron, &c. Let us take, then, a fowl which is about to die of chicken cholera, and let us dip the end of a delicate glass rod in the blood of the fowl with the usual precautions upon which I need not here dwell. Let us then touch with this charged point some *bouillon de poule*, very clear, but first of all rendered sterile under a temperature of about 115° Centigrade, and under conditions in which neither the outer air nor the vases employed can introduce exterior germs—those germs which are in the air, or on the surface of all objects. In a short time, if the little culture vase is placed in a temperature of 25° to 35°, you will see the liquid become turbid, and full of tiny microbes, shaped like the figure 8, but often so small that under a high magnifying power they appear like points. Take from this vase a drop as small as you please, no more than can be carried on the point of a glass rod as sharp as a needle, and touch with this point a fresh quantity of sterilised *bouillon de poule* placed in a second vase, and the same phenomenon is produced. You deal in the same way with a third culture vase, with a fourth, and so on to a hundred, or even a thousand and invariably within a few hours the culture liquid becomes turbid and filled with the same minute organisms. At the end of two or three days' exposure to a temperature

of about 30° C. the thickness of the liquid disappears, and a sediment is formed at the bottom of the vase. This signifies that the development of the minute organism has ceased—in other words, all the little points which caused the turbid appearance of the liquid have fallen to the bottom of the vase, and things will remain in this condition for a longer or shorter time, for months even, without either the liquid or the deposit undergoing any visible modification, inasmuch as we have taken care to exclude the germs of the atmosphere. A little stopper of cotton sifts the air which enters or issues from the vase through changes of temperature. Let us take one of our series of culture preparations—the hundredth or the thousandth for instance—and compare it in respect to its virulence with the blood of a fowl which has died of cholera; in other words, let us inoculate under the skin ten fowls, for instance, each separately with a tiny drop of infectious blood, and ten others with a similar quantity of the liquid in which the deposit has first been shaken up. Strange to say, the latter ten fowls will die as quickly and with the same symptoms as the former ten; the blood of all will be found to contain after death the same minute infectious organisms. This equality, so to speak, in the virulence both of the culture preparation and of the blood is due to an apparently futile circumstance. I have made a hundred culture preparations—at least, I have understood that this was done—without leaving any considerable interval between the impregnations. Well, here we have the cause of the equality in the virulence. Let us now repeat exactly our successive cultures with this single difference, that we pass from one culture, to that which follows it—from the hundredth to, say, the hundred and first, at intervals of a fortnight, a month, two months, three months, or ten months. If, now, we compare the virulence of the successive cultures, a great change will be observed. It will be readily seen from an inoculation of a series of ten fowls that the virulence of one culture differs from that of the blood and from that of a preceding culture when a sufficiently long interval elapses between the impregnation of one culture with the microbe of the preceding. More than that, we may recognise by this mode of observation that it is possible to prepare cultures of varying degrees of virulence. One preparation will kill eight fowls out of ten, another five out of ten, another one out of ten, another none at all, although the microbe may still be cultivated. In fact, what is no less strange, if you do take each of these cultures of attenuated virulence as a point of departure in the preparation of successive cultures and without appreciable interval in the impregnation, the whole series of these cultures will reproduce the attenuated virulence of that which has served as the starting point. Similarly, where the virulence is null it produces no effect. How, then, it may be asked, are the effects of these attenuating virulences revealed in the fowls? They are revealed by a local disorder, by a morbid modification more or less profound in a muscle, if it is a muscle which has been inoculated with the virus. The muscle is filled with microbes which are easily recognised because the attenuated microbes have almost the bulk, the form, and the appearance of the most virulent microbes. But why is not the local disorder followed by death? For the moment let us answer by a statement of facts. They are these: the local disorder ceases of itself more or less speedily, the microbe is absorbed and digested, if one may say so, and little by little the muscle regains its normal condition. Then the disease has disappeared. When we inoculate with the microbe the virulence of which is null there is not even local disorder, the *natura medicatrix* carries it off at once, and here, indeed, we see the influence of the resistance of life, since this microbe, the virulence of which is null, multiplies itself. A little further, and we touch the principle of vaccination. When the fowls have been rendered sufficiently ill by the attenuated virus which the vital resistance has arrested in its development, they will, when inoculated with virulent virus, suffer no evil effects, or only effects of a passing character. In fact, they no longer die from the mortal virus, and for a time sufficiently long, which in some cases may exceed a year, chicken cholera cannot touch them, especially under the ordinary conditions of contagion which exist in fowl-houses. At this critical point of our manipulation—that is to say, in this interval of time which we have placed between two cultures, and which causes the attenuation—what occurs? I shall show you that in this interval the agent which intervenes is the oxygen of the air. Nothing more easily admits of proof.

Let us produce a culture in a tube containing very little air, and close this tube with an enameller's lamp. The microbe in developing itself will speedily take all the oxygen of the tube and of the liquid, after which it will be quite free from contact with oxygen. In this case it does not appear that the microbe becomes appreciably attenuated, even after a great lapse of time. The oxygen of the air, then, would seem to be a possible modifying agent of the virulence of the microbe of chicken cholera—that is to say, it may modify more or less the facility of its development in the body of animals. May we not be here in presence of a general law applicable to all kinds of virus? What benefits may not be the result? We may hope to discover in this way the vaccine of all virulent diseases; and what is more natural than to begin our investigation of the vaccine of what we in French call charbon, what you in England call splenic fever, and what in Russia is known as the Siberian pest, and in Germany as the Milzbrand. In this new investigation I have had the assistance of two devoted young *savants*—MM. Chamberland and Roux. At the outset we were met by a difficulty. Among the inferior organisms, all do not resolve themselves into those corpuscle germs which I was the first to point out as one of the forms of their possible development. Many infectious microbes do not resolve themselves in their cultures into corpuscle germs. Such is equally the case with beer yeast, which we do not see develop itself usually in breweries, for instance, except by a sort of scissiparity. One cell makes two or more, which form themselves in wreaths; the cells become detached, and the process recommences. In these cells real germs are not usually seen. The microbe of chicken cholera and many others behave in this way, so much so that the cultures of this microbe, although they may last for months without losing their power of fresh cultivation, perish finally like beer yeast which has exhausted all its aliments. The anthracoid microbe in artificial cultures behaves very differently. In the blood of animals, as in cultures, it is found in translucid filaments more or less segmented. This blood or these cultures freely exposed to air, instead of continuing according to the first mode of generation, show at the end of forty-eight hours corpuscle germs distributed in series more or less regular along the filaments. All around these corpuscles matter is absorbed, as I have represented it formerly in one of the plates of my work on the diseases of silkworms. Little by little all connection between them disappears, and presently they are reduced to nothing more than germ dust. If you make these corpuscles germinate, the new culture reproduces the virulence peculiar to the thready form which has produced these corpuscles, and this result is seen even after a long exposure of these germs to contact with air. Recently we discovered them in pits in which animals dead of splenic fever had been buried for twelve years, and their culture was as virulent as that from the blood of an animal recently dead. Here I regret extremely to be obliged to shorten my remarks. I should have had much pleasure in demonstrating that the anthracoid germs in the earth of pits in which animals have been buried are brought to the surface by earthworms, and that in this fact we may find the whole etiology of disease, inasmuch as the animals swallow these germs with their food. A great difficulty presents itself when we attempt to apply our method of attenuation by the oxygen of the air to the anthracoid microbes. The virulence establishing itself very quickly, often after four-and-twenty hours in an anthracoid germ which escapes the action of the air, it was impossible to think of discovering the vaccine of splenic fever in the conditions which had yielded that of chicken cholera. But was there, after all, reason to be discouraged? Certainly not; in fact, if you observe closely, you will find that there is no real difference between the mode of the generation of the anthracoid germ by scission and that of chicken cholera. We had, therefore, reason to hope that we might overcome the difficulty which stopped us by endeavouring to prevent the anthracoid microbe from producing corpuscle germs and to keep it in this condition in contact with oxygen for days, and weeks, and months. The experiment fortunately succeeded. In the ineffective (*neutre*) *bouillon de poule* the anthracoid microbe is no longer cultivable at 45° C. Its culture, however, is easy at 42° or 43°, but in these conditions the microbe yields no spores. Consequently it is possible to maintain in contact with the pure air at 42° or 43° a *mycelienne* culture of bacteria entirely free of germs. Then appear the very remarkable results which follow. In a month

or six weeks the culture dies—that is to say, if one impregnates with it fresh *bouillon*, the latter is completely sterile. Up till that time life exists in the vase exposed to air and heat. If we examine the virulence of the culture at the end of two days, four days, six days, eight days, &c., it will be found that long before the death of the culture the microbe has lost all virulence, although still cultivable. Before this period it is found that the culture presents a series of attenuated virulences. Everything is similar to what happens in respect to the microbe in chicken cholera. Besides, each of these conditions of attenuated virulence may be reproduced by culture; in fact, since the charbon does not operate a second time (*ne récidive pas*), each of our attenuated anthracoid microbes constitutes for the superior microbe a vaccine—that is to say, a virus capable of producing a milder disease. Here, then, we have a method of preparing the vaccine of splenic fever. You will see presently the practical importance of this result, but what interests us more particularly is to observe that we have here a proof that we are in possession of a general method of preparing virus vaccine based upon the action of the oxygen and the air—that is to say, of a cosmic force existing everywhere on the surface of the globe. I regret to be unable from want of time to show you that all these attenuated forms of virus may very easily by a physiological artifice, be made to recover their original maximum virulence. The method I have just explained of obtaining the vaccine of splenic fever was no sooner made known than it was very extensively employed to prevent the splenic affection. In France we lose every year by splenic fever animals to the value of 20,000,000*fr.* I was asked to give a public demonstration of the results already mentioned. This experiment I may relate in a few words. Fifty sheep were placed at my disposition, of which twenty-five were vaccinated. A fortnight afterwards the fifty sheep were inoculated with the most virulent anthracoid microbe. The twenty-five vaccinated sheep resisted the infection; the twenty-five unvaccinated died of splenic fever within fifty hours. Since that time my energies have been taxed to meet the demands of farmers for supplies of this vaccine. In the space of fifteen days we have vaccinated in the departments surrounding Paris more than 20,000 sheep and a large number of cattle and horses. If I were not pressed for time I should bring to your notice two other kinds of virus attenuated by similar means. These experiments will be communicated by-and-bye to the public. I cannot conclude, gentlemen, without expressing the great pleasure I feel at the thought that it is as a member of an international medical congress assembled in England that I make known the most recent results of vaccination upon a disease more terrible, perhaps, for domestic animals than small-pox is for man. I have given to vaccination an extension which science, I hope, will accept as homage paid to the merit and to the immense services rendered by one of the greatest men of England, Jenner. What a pleasure for me to do honour to this immortal name in this noble and hospitable city of London!

Original Communications.

ANOREXIA NERVOSA.

By THOMAS STRETCH DOWSE, M.D., F.R.C.P.Ed.,
Physician to the Hospital for Epilepsy and Paralysis; formerly
Physician Superintendent Central London Sick Asylum.

(Continued from page 97.)

WHEN I first saw her I at once recognised her condition. She was thin and emaciated, and was unable to stand without assistance; the eyes were downcast, and the cheek bones were prominent from the wasting of the cheeks; and the angles of the mouth were drawn down, so that she looked the picture of misery. The voice was scarcely audible, and the least thing would make her cry. She was taciturn, shy, and reserved; she did not complain of pain. There was a general morbid state of functional inactivity; all her movements were slow, and her mind was equally inactive. The breath was offensive, the tongue fairly clean, the bowels obstinately confined, and the evacuations were pale and clay-coloured. The temperature was never over 98° Fahr., and frequently below it; the extremities were cold and of a bluish colour;

the special senses were normal; the pupils of the eyes were sluggish, and did not contract readily to light. Pulse 120. Resp. 20. There was no marked *anæsthesia* of the fauces; no globus or other hysterical symptoms. Of course the great feature in the case was her disinclination to take food, and I had frequently to threaten that I should resort to feed her by forcible means; but fortunately this mode of procedure was avoided. She was in the hospital for over two months, and her condition upon her admission and upon her departure was very striking and characteristic. (*See illustrations.*) She had gained

No. 2.

Drawn from the original photograph, showing the state of the patient after treatment

very considerably in weight, and instead of being taciturn and reserved, she was cheerful and agreeable to all around her, and took her food without any reserve or hesitation. The cure was unquestionably brought about by the frequent administration of fluid nourishment. I made it compulsory upon her to take three eggs, one pint of the strongest

beef-tea, three pints of milk, and three ounces of brandy (all beaten up together) at frequent intervals during the twenty-four hours. The nurse upon several occasions experienced the greatest difficulty in overcoming her objection to food; but firmness and persuasion at last conquered, and in the course of a few weeks very little difficulty was experienced. As soon as this took place she rapidly improved, and left the hospital quite well. No medicine was administered, excepting half a drop of croton oil occasionally, to relieve the bowels.

Diagnosis.—The diagnosis of anorexia nervosa may be confounded, as Dr. Fenwick has so clearly pointed out, with phthisis, tubercular meningitis, and tubercular peritonitis, but mistakes in diagnosis are not so liable to occur if every feature of the disease be taken into consideration; for instance, the mental state of the patient must not be lost sight of, and it will almost invariably be found that the patient is abnormally restless and active, or taciturn, sullen, and reserved. The temperature of the patient may be looked upon as an important aid in differential diagnosis, for it is more frequently below the normal than above it; but I fear the nature of the pulse cannot be considered equally diagnostic. In Sir William Gull's cases the pulse was very slow, and I have found this condition to exist in several of my own cases; but in the case which I have just detailed, the pulse was 120 per minute for some time until nutrition was re-established. There can be no doubt that in past times, even if such does not exist at the present day, these cases of anorexia nervosa have been looked upon as cases of consumption, catarrh of the stomach, indigestion, and cancer, and that the patients have really died from inanition and starvation when continuous feeding would have saved their lives, and for this reason it is highly important that no mistake in diagnosis should arise. Dr. Fenwick says: "I have twice known nervous anorexia diagnosed as tubercular meningitis, and in one of these instances the mistake was committed by a well-known hospital physician, who had devoted special attention to diseases of the nervous system. I cannot, however, for my own part, see how such a mistake should arise if proper and due care be taken. There are conditions of anorexia nervosa which are unquestionably associated with tubercular phthisis, and especially tubercle in a latent form, and under such circumstances, the diagnosis is by no means easy; but the absence of cough, night sweat, and absolute defective nerve power, will, in most cases, decide the question."

Treatment.—This is unquestionably the most important point which the physician has to consider, and it is really astonishing to see with what remarkable rapidity these apparently hopeless and helpless cases are restored to perfect health when they are placed under proper and appropriate treatment, even when death seems inevitable. I think it will be admitted that the patient who is dying of starvation, because she willingly and persistently refuses food, cannot be looked upon as of sound mind; at all events, for the time being, I think it is wise that such a patient should be placed away from her immediate friends, and be nursed by one who will act with resolution, kindness, and determination. I have often found it to be a very difficult matter to effect my purpose in this respect, and in some cases it has not been found absolutely necessary; but in others I have found myself powerless to do my patient any good whilst she has been subject to the sympathy and irresolute action of her immediate friends. It has been truly said that in some cases, "It is cruel to be kind."

Then the case should be placed under the care of a highly-trained nurse, who would of course be held responsible for the proper carrying out of the treatment. I know there are many physicians who are inclined in the first instance to treat these cases as atomic dyspepsia, to limit the diet to certain articles of food, to administer mineral tonics—maltine, Easton's syrup, pepsine, and so on. I am bound to say that this, in my experience, is anything but the appropriate treatment. There is no

want of saliva or gastric juice, but there is an atony about the secreting glands as there is about the body generally, and they want stimulating by the frequent introduction of food into the stomach, and it matters not whether the food be solid or liquid so long as food be taken; but it is much more easy to make a patient, under such circumstances, take fluid rather than solid nourishment, and although I should be strongly opposed to the administration of alcohol alone in any form, yet I am so thoroughly impressed with its value in these cases, in combination with eggs, milk, and strong meat stock, that I order the patient to take as much as three or four ounces of brandy in the twenty-four hours. Food of such kind as that just mentioned should be given every two hours.

The temperature of the body should be maintained and the extremities, particularly the feet, should be kept as warm as possible, and bottles of hot water should be applied to them, as well as to the spine and under the armpits, if the urgency of the case demands it.

The bowels are usually costive and the motions are clay-coloured, and to alter this I give one grain of grey powder night and morning, and a warm aloetic purge, with valerian and potassio-tartrate of soda every third morning. Shampooing the limbs and the spine every night and morning, and the daily use of the flesh gloves and a tepid soap and water bath, are decided adjuncts in effecting a cure. There is such a distinct difference between this disease and other conditions due to anæmia, that I am not at all inclined to use the salts of iron or the phosphatic salts. About three or four years ago I was requested by Sir W. Gull and Mr. Whitmore to take charge of a gentleman, æt. sixty, who was suffering from anorexia nervosa; and it was with the greatest difficulty that he could be persuaded to take nourishment of any kind. He was greatly emaciated, and so weak that he had scarcely any power to turn in bed, and upon careful examination no organic disease of any kind could be detected; neither from sign nor symptom was any disease suspected; his mind was perfectly clear, memory good, yet there was this strange aversion to taking food; he was quiet and reserved, rather than taciturn or morose. At times he suffered great agony from fear of impending death, and then the respirations became hurried and panting; he improved greatly by the frequent administration of fluid nourishment, and was asking for certain kinds of food from choice, but he became suddenly more weak and died from asthenia; and, rather strange to say, that his father died in a similar way, after having refused to take any kind of food for weeks. Cases like these are of great interest, and certainly belong to the borderland of insanity, although they differ in great measure from the cases of confirmed melancholia with anorexia, which are so frequently seen in the wards of the lunatic asylum.

Clinical Records.

ST. MARY'S HOSPITAL.

Oxaluria, with Symptoms of Vesical Calculus—Sounding for Stone, Followed by Reflex Paralysis—Cured.

Under the care of MR. NORTON.

JUNE 8th.—The patient, æt. 44, was a healthy-looking man, with a strong constitution. About ten years ago felt slight pains in lower part of back on the left side; and about the same time experienced pains in penis and perineum (and slightly in testicle) after passing water, which was no longer clear, as before. As time passed on these pains grew worse; he had medical advice at Weymouth, upon which occasion a stone was sounded for in the bladder, but was unable to be detected. In August last he passed about a tablespoonful of blood after making

water, and has occasionally done so since. He continued work until May 15th last, when he was in such pain that he had to go home and remain quiet. This he did for three weeks; but finding that no improvement was taking place he came to London, and was received into this hospital. Patient contracted gonorrhoea twenty-seven years ago, but had no signs of stricture or any other evil result. Upon admittance the patient complained of pains in the penis and perineum after passing water, and also in the testicles, but to a less extent, and of intermittent pains in back, extending from the last rib to crest of ilium (especially on the left side); the pain sometimes extends right across the back. When wishing to make water he has no power to retain it.

9th—His urine is cloudy, and is slightly alkaline when first passed.

10th—Mr. Norton sounded for stone, but none could be detected. Characteristics of urine: Pale orange colour; sp. gr. 10.25; alkaline reaction; under the microscope crystals of oxalic acid may be seen, and a few pus cells; there is a trace of phosphates, but no albumen.

11th—Patient passed a very bad night; had rigors from 5 p.m. yesterday until 3 a.m. this morning; temp. M. 99.

12th—Patient much better.

13th—Experiences less pain after micturition; but still has great pain in back.

21st—Mr. Norton again sounded for a stone, but none could be detected.

22nd—Patient had a very bad night; had rigors from 10 p.m. yesterday until 2 a.m. this morning; suffered a good deal of pain in lower extremities; temp. M. 101.8.

23rd—Patient still complains of great pain in back and lower extremities; had rigors at 3 p.m. yesterday, and also during the night; temp. M. 101.6.

24th—Had rigors yesterday afternoon and during the night. He is very weak at the present time, and has lost a great deal of power over the lower limbs, and has difficulty in speaking; the tongue deviates to the right side when protruded, and there is slight ptosis of the left upper eyelid. Has only partial sensation in his legs and feet, especially the right, which latter he is unable to lift from off the bed. Double vision; hyper-vascularity of left side of forehead, left eye-ball, and left side of head and neck. Dr. Handfield Jones saw the case, and was inclined to look upon it as reflex paralysis, arising from the sounding the bladder for stone.

25th—Slept badly last night, but has had no more rigors.

26th—Had a slight rigor at 5 a.m. this morning; has not regained the use of lower limbs; mouth is drawn over slightly to the right side.

27th—Patient slept pretty well last night, but his mind wandered at times.

28th—Tongue still protruded to the right; vascularity of left side of face less marked; ptosis less marked; has double vision this day. To all appearance power is increasing.

29th—Patient is a little better; has more power over lower limbs.

30th—Progressing favourably; no ptosis, and no hyper-vascularity of left side of face; tongue does not deviate to the right when protruded.

July 1st—Perfectly recovered use of right leg; strained left shoulder, cannot raise it to his head without lifting with other arm.

4th—Has very little pain either during or after micturition; pain in back a little better.

7th—Pain during and after micturition has ceased.

13th—Had great pain in left testicle during the night; temperature went up to 102. Much better in the morning; temp. 100; pain completely gone.

14th—Slept well; left testicle much swollen; pain in back worse.

19th—Pain in back has increased since the swelling of testicle.

21st—Testicle has resumed its normal size; patient has no pain.

26th—Progressing favourably.

30th—Dismissed cured.

The treatment consisted of alkalies with buchu in the commencement, but was soon changed for acid tincture of iron.

ON PARACENTESIS THORACIS BY ASPIRATION IN ACUTE PLEURISY.

Par Dr. GEORGES DIEULAFOY,

Professeur Agrégé à la Faculté de Médecine de Paris; Médecin des Hôpitaux; Lauréat de l'Institut (prix Montyon).

Translated by C. A. OWENS, M.D., L.R.C.P. Ed.,
L.R.C.S.I., &c.

(Concluded from page 99.)

CHAPTER IV.

Method of performing Paracentesis Thoracis by Aspiration in Acute Pleurisy.

CERTAIN practitioners are in the habit of emptying the effusions to the last drop, resulting sometimes in a pink coloration of the fluid and violent fits of coughing. I find this custom useless when the flow of the fluid into the aspirator slackens, and when I perceive that the flow is drawing to a close I finish the operation without regard to the few ounces which may remain in the pleural cavity. Such is the mode of proceeding which I always practice, and which seems to me absolutely free from danger. Some objections have been raised against it; I propose replying to these, at the same time touching upon some particular points in the operation.

I must first observe that there is not much in the choice of an aspirator; the vacuum may be variable or invariable, it matters little provided the flow is not continuous or precipitate. If I incline to the use of a rack aspirator it is because it seems to me to fulfil the conditions required, first for aspiration and then for the treatment of those diseases in which it becomes necessary to combine injections with aspirations, such as empyema, suppurating hepatic cysts, &c.

But as there is a great deal in the choice of an aspirator needle; and it has been seen how I insist on the use exclusively of needle No. 2, of which the calibre is hardly the one-twentieth of an inch. Many objections have been made to this needle; it is said it only permits a slow current of fluid, that it is easily stopped up, and that its sharp point may wound the lung. What foundations are there for these objections? It is said that such a fine needle retards the flow and so prolongs the operation. In reply that this objection is altogether for the patient's benefit, for it is the tardiness of the flow which allows the lung to unfold itself without shock and without those fits of coughing sometimes so painful, which accompany the old method of operating. The objection is even of advantage to the operator, for if he loses a few minutes by the slowness of the flow he regains them amply in occupying no time in preparation for the operation, adjusting the gold-beaters skin, and the action of the trocar. Moreover, even with No. 2 needle, the flow is not so very slow, since, I repeat, a pint and a-half of fluid may be aspirated in twelve minutes. Thanks to the smallness of its calibre, No. 2 needle traverses the intercostal space without any difficulty and without any fumbling, which is not without importance, for sometimes under the influence of fear or pain the patient compresses his ribs, almost obliterating the intercostal spaces. The prick made by this needle is so fine that the wound it produces never becomes fistulous, and one need never fear inflammation of the skin extending to the pleural cavity.

The notion that such a fine needle easily gets stopped up is purely imaginary, and falls before facts; if it were a case of purulent effusion it would be different, but in simple pleurisy the needle never becomes choked. Many operations may be performed without witnessing such an occurrence; and if it should happen a stroke of the piston suffices to remove the foreign body, such as fibrin or a piece of membrane, and the operation is resumed. The third objection made to the needle is that the lung may encounter its point and be wounded in its movement of expansion. To avoid this Dr. Castiaux conceived a trocar with a guarded point; Dr. Potain also uses this instrument. I must say that I have never seen such an accident, nor, I believe, has anybody else. The lung, squeezed back and compressed against the spine by the fluid, unfolds itself slowly; it does not advance towards the chest wall and meet the needle so rapidly—far from it. However, there is a slight manoeuvre as simple as it is easy of performance, which

will meet all difficulties; it consists in gradually withdrawing the needle as the liquid flows, then inclining it in such a way as to bring it parallel with the wall of the chest, and thus all danger is removed. In short, the small calibre of needle No. 2, the facility with which it passes through the tissue, its complete harmlessness, the absence of pain, and the simplicity of the operation, are all facts which plead in its favour and compel me to prefer it to the trocar. Other objections have been made to aspiration; it is pretended that the vacuum when it is too complete or too perfect sucks out the fluid with such force that it lowers the pleural tension, and that certain accidents, as pulmonary oedema, albuminous expectoration, tearing of false membranes, and intra-thoracic hemorrhage, may result from this, which amounts to saying that it is no better to perform paracentesis with an apparatus in which the vacuum is badly formed and incomplete than with one in which it is well formed. At first sight the objection seems to have some show of reason in it, but there is an error in the interpretation of facts. I have already demonstrated that the accusations made against aspiration have a false bearing; I build up no theories; I collect facts; I have classified the accidents supervening on paracentesis done with or without aspiration, and I showed that the greater part of these accidents are associated with paracentesis done in the old way, without aspiration. Let it not be said, therefore, that these accidents are directly attributable to exaggerated pleural tension caused by aspiration because I shall in that case refer to identical accidents occurring with Reybard's trocar when the tension was the same inside and outside the chest. Nevertheless, I was the first to recognise that in aspiration imperfectly carried out there are real drawbacks; but it is not in regard to the quality of the vacuum but the quantity. It is not because one and a-half pints of fluid have been withdrawn with a well-made vacuum, but because five pints have been removed even with an incomplete vacuum or even without any at all. Let it be well understood that it is not the aspiration which is injurious, but the manner in which it is performed; and as I have often said we must know how to regulate the vacuum. For example, here is a patient who for five, six, or eight weeks has been affected with an effusion of five or six pints in the left side of the chest, the heart and pulmonary vessels are turned aside, the lung is flattened, the cardio-pulmonary circulation is embarrassed, and all at once the five or six pints of fluid which have hampered for so long the performance of the functions of these organs are suddenly removed, and the circulation returns immediately with the precipitation into the pulmonary vessels, the air entering the alveoli; and then we are surprised at accidents happening! What surprises me is that more do not occur. No, it is not aspiration, or a vacuum too perfectly formed which must bear the reproach of these drawbacks, but operations prolonged beyond reason and badly conceived, together with the employment of too large trocars; it is in a word due to resorting to an imperfectly understood operation, to a manoeuvre which, without taking into consideration sufficiently the nature of the pleurisy, its age, complications, &c., allows a considerable effusion to be too rapidly and too completely withdrawn from the cavity of the thorax. This is why, I must repeat it once more, the secret of safety to the patient, and comfort to one's self in operating consists in using No. 2 needle and in limiting, according to each case, the quantity of fluid withdrawn at a sitting. Paracentesis thus performed becomes nothing more than a prick of a needle, as easy to make, as insignificant, and as convenient as the punctures made daily with Pravaz's syringe.

I may be pardoned being so emphatic in my conclusions, my excuse being that the facts which I advance are neither based on theories nor on hypotheses; they rest upon a considerable number of observations. The abuse into which the operation has for some years fallen, the discussions undertaken on the subject of accidents following it; the diverse interpretations, sometimes erroneous, given to these accidents; the discredit thrown by some writers not only on aspiration, but even on paracentesis; all these reasons prompted me to reopen this question, to study its bright as well as its dark side, and to formulate clearly the convictions to which I have been led.

CHAPTER V.

Résumé of Paracentesis Thoracis by Aspiration.

Paracentesis by aspiration as a treatment in acute pleurisy is absolutely harmless when performed with No. 2 needle, and when the amount of fluid withdrawn at one time does not exceed one and a-half, or even less, bearing in mind the complications of pleurisy.

The accidents in connection with paracentesis of which it has been accused, differ in nature, and may be placed in three divisions:—

Those of the third class—the so-called transformation of serous into purulent fluid—cannot be attributed to paracentesis; they are the result of the natural evolution of legitimate purulent pleurisy, and not in any way the consequence of a provoked transformation of the fluid.

Those of the second category—syncope and asphyxia, due to thrombosis and embolism of the heart and pulmonary vessels,

gangrene of the pleura, and malignant disease—ought not to be laid at the door of paracentesis, seeing that they may be observed independently of all surgical interference, before as well as after paracentesis. They are therefore *amenities* of pleurisy and not the operation.

The accidents in the first class—acute oedema of the lung, pulmonary congestion, with or without albuminous expectoration—are those which alone can be directly or indirectly attributed to paracentesis, and it is precisely these which may be foreseen and avoided. In fact, they are always associated either with the immediate issue of a large quantity of fluid, or with complications, but more frequently with both these causes combined; whence the rule to limit the quantity of fluid withdrawn at one sitting, and to proportion it to the complications of the case.

This I believe to be the question of paracentesis reduced to its real worth; the mode of operation is unvarying; it is only the indications for the operation which are variable, and these may be given in two words: Paracentesis is either *urgent* or *disputable*. Urgency can and should only be based on an estimate of the quantity of fluid effused. In all other cases paracentesis is a matter of question, and subject to the consideration and discernment of him who is studying the course and nature of the disease; and this appreciation varies so to speak with each pleurisy, for there are few diseases so capricious in their nature or so variable in their evolution.

Special.

FRANCE.

[FROM OUR SPECIAL CORRESPONDENT.]

STRANGULATED HERNIA.—At the last meeting of the Société de Chirurgie M. Verneuil drew the attention of the Society to the algidity observed in cases of strangulated hernia. In a patient recently admitted into hospital the autopsy showed pulmonary congestion and a double nephritis of an aggravated form. Another case was that of a woman, who for eight years had a small hernia. On the 15th June she felt symptoms of strangulation, and forty-eight hours afterwards was placed under his care. The clinical assistants endeavoured to reduce the tumour under chloroform, but without taking the temperature. At the end of a few minutes the patient was observed to get cold, and the anæsthetic was stopped; on placing the hand on the tumour it returned to the abdominal cavity with facility. A spica bandage was applied, and some stimulants were given. The temperature was taken half an hour after the reduction; it was found to be not more than 95 deg. A few hours afterwards the woman died without any other symptom. There was no urine in the bladder, no trace of peritonitis. The lungs were congested. M. Verneuil concluded from these and other observations that algidity was a frequent cause of death in these cases, and that the thermometer ought always to be applied before administering chloroform which was counter indicated in pulmonary congestion. M. Després said that he always took the temperature before operating, and always found it below the normal. M. Labbé thought the precept suggested by M. Verneuil could be followed by unhappy consequences in that it furnished a pretext to those who oppose any operation. M. Verneuil, however, did not wish it to be understood that he considered algidity and pulmonary congestion as counter indicating an operation; on the contrary. But he was wont before operating to combat the congestion by revulsives, subcutaneous injections of ether, &c.

REBELLIOUS SCIATICA CURED BY NERVE STRETCHING.—The patient was a man of forty-five years of age, of good constitution without any hereditary antecedent. The sciatica, from which he has suffered for sixteen years, resisted all the ordinary means of treatment, and had lately become greatly accentuated, the pain being so excessive that sleep was impossible. Morphic injections proved useless. Stretching of the nerve was proposed and resorted to. An incision was made over the track of the nerve from the lower border of the gluteus maximus. The muscles were separated, and the nerve, isolated with care from the surrounding parts, was drawn forward and forcibly stretched. The wound healed by first intention. Since the operation, which took place four months ago, the patient has been entirely free from pain. Dr. Gen has collected seventy-three cases of nerve stretching with the

following results :—Traumatic neuralgia, six cases, four successful, one ameliorated, and one unsuccessful; idiopathic neuralgia, fourteen cases, ten successful, three ameliorated, one death from hæmorrhage; clonic spasms and contractures, six cases, four successful, two unsuccessful; tetanus, sixteen cases, seven successful, seven ameliorated but death followed, two no benefit. In thirty-seven cases collected by another doctor, sixteen times the operation was performed on the sciatic nerve, five times on the median, four times on the tibial, four on the brachial plexus, one on the suborbital, one on the facial, and one on the lower dental nerve. The best results were obtained in the cases of sciatic neuralgia, and in general in all the cases of neuralgia of traumatic origin.

PILOCARPINE IN CROUP.—Croup in infants is well known to be difficult to get under, and in them tracheotomy is always followed by death. The employment of topics is very difficult because unless they are brought to touch the vocal cords the effect intended will not be obtained. Amongst the numerous remedies recommended against this disease, the injection of pilocarpine may be ranked with some of the latest, and it has this advantage, it is practised with facility. It is thus that M. Damaschino treated an infant of one month, and with success. Two subcutaneous injections were made every day of ten drops of the solution. The first effects were sweating salivation and abundant expectoration, as children of this age do not know how to expectorate the false membranes were swallowed, but the diagnostic was beyond doubt.

At the Société de Médecine, Bordeaux, a child a month old was presented exhibiting several interesting malformations. There was a deficiency in the front of the pelvis and bladder, a recto-vesical fistula; at each side in the groins were the testicles; the anus was imperforate; the second toe of the foot was bifid. The body of the child was excessively small, and in the left ilio lumbar region a bilobed spina bifida was observed about the size of a hen's egg. The multiplicity of the lesions and especially the existence of the spina bifida and the recto vesical fistula counter indicated all operation. The prognostic was necessarily of the gravest.

The Mineral Waters of Europe.

THE "MEDICAL PRESS" ANALYTICAL REPORTS ON THE PRINCIPAL BOTTLED WATERS.

By CHARLES C. R. TICHBORNE, LL.D., F.C.S., F.I.C.

President of the Pharmaceutical Society of Ireland, Lecturer on Chemistry, Carmichael College of Medicine, &c.

WITH

NOTES ON THEIR THERAPEUTICAL USES.

By PROSSER JAMES, M.D., M.R.C.P.Lond.,

Lecturer on Materia Medica and Therapeutics at the London Hospital, Physician to the Hospital for Diseases of the Throat, &c.

(Continued from page 137.)

OREZZA.

THIS water is peculiar because it may be drank freely as a table water, yet its most marked property is its chalybeate character.

We have not analysed it, but have merely examined it as regards its freedom from organic impurities. The analysis was performed by Poggiale, and we give his figures, calculated to the imperial gallon :

Carbonate of calcium	42.14
Carbonate of magnesium	5.18
Carbonate of protoxide of iron	8.96
Sulphate of calcium	1.47
Chloride of potassium	}	...	0.98
Chloride of sodium			
Alumina	0.42
Silica	0.28

Total solids ... 59.43 grs.

Free carbonic acid 1.24 per 1,000 parts.

Skeleton Analysis of ½-pint (10 ozs. fluid).

Solids.	Salines.	Antacids.	Iron Purgatives.
3½ grs.	3 grs.	6 100ths.	½ grain.

The Orezza spring is in Corsica, and is chiefly used in its own district for drinking purposes. It is free from organic nitrogenous matter.

BADEN-BADEN.

The four springs which gives celebrity to Baden-Baden, as a bathing establishment have lately been united into one by an extensive series of works carried on under the Grand Ducal Government. Shafts were sunk under the castle, uniting in one main shaft, the springs, Ungemach, Brub, Hölle, and Juden spring. Some of these shafts are 400 metres long (441 yards). Prof. Bunsen has lately performed a most elaborate analysis of this water, and by operating upon immense quantities, has got out the quantities to a great nicety. Thus, to estimate the arsenic, he operated upon half-a cwt. of the water. It would be presumptive to pretend to refine upon such an analysis, which could only be performed upon the spot. We, therefore, give Bunsen's figures calculated to grains per gallon :

Bicarbonate of iron	0.371
Bicarbonate of magnesium	2.051
Bicarbonate of manganese	0.945
Bicarbonate of lime	11.7929
Sulphate of strontia	3.164
Sulphate of lime	14.8078
Chloride of potassium	9.3128
Chloride of sodium	141.1031
Chloride of calcium	1.4763
Chloride of lithium	3.7567
Chloride of rubidium	0.0934
Chloride of calcium	0.938
Chloride of magnesium	7.511
Bromide of magnesium	3.752
Normal calcium ortho-arsenate	0.490
Normal calcium ortho-phosphate	0.115
Silica	8.9138
Carbonic acid	1.2117

Drugs of the ammonia and organic solution ... 194.3948

Skeleton analysis of ½-pint (10 ounces fluid).

Total Solids.	Salines.	Antacids.	Purgatives.	Arsenate of Calcium
12 grs.	9½ grs.	¾ grs.	0.5 grs.	0.03 grs.

Bunsen states that the combined waters from this main shaft differs very little from the individual spring, which he had previously analysed. In speaking of the arsenic and lithium, he says, as these two ingredients, in particular, are of great interest in medical regard, I have taken special points to determine their amounts. The method adopted may be interesting to our readers in showing how such minute composition in mineral waters is arrived at, and also as illustrating the wonderful difference a minute analysis, such as Bunsen gives, and the merest outline, as illustrated in the analysis of the Rosbach springs.

The arsenic was precipitated from about half-a cwt. of water previously concentrated, and then acidulated with muriatic acid at a temperature of from 70° to 80° (cwt.)

by means of sulphuretted hydrogen maintained continuously for five days. That the arsenic was not derived from the materials used in the experiment, but from the mineral water itself, was demonstrated in a counter-experiment, in which distilled water, placed in the same utensil, and subjected precisely to the same treatment, with the same chemical agents as the mineral water had been, exhibited no trace of arsenic.

SCHWALHEIM.

Schwalheim water is not much used in this country, yet it is a very good spring of a distinctive character, namely, a water which owes its alkalinity or antacid properties entirely to the carbonate of calcium. It is also a slightly chalybeate water, and contains a small quantity of lithium. The presence of lithium was first noticed by the writer of these articles in the year 1867. The spring had previously been analysed by Liebig, but it is just possible that a change had taken place between the dates of the analyses. The writer gives his own figures. That analysis had been very carefully performed at the time, and has since been generally adopted and used by the proprietors.

Schwalheim water contains per gallon :

Carbonate of calcium	40.400
Ferrous carbonate	1.360
Carbonate of magnesium	5.528
Chloride of potassium	3.776
Chloride of magnesium	3.992
Chloride of lithium	0.034
Chloride of sodium	97.648
Sulphate of sodium	6.056
Bromide, trace			
Silica	8.480
Carbonic acid (not determined)	...		

Total solids ... 187.274 gra.

Skeleton Analysis of 1/2 pint (10 ozs. fluid).

Total solids.	Salines.	Antacids.	Purgatives.	Iron.
101 gra.	6 1/2 gra.	23 gra.	1 1/2 gra.	1-10th gr.

A PIECE of silver plate was last week presented to Dr. Lynch, of Loughrea, on his leaving that place. The subscriptions to the testimonial amounted to £250.

AMERICAN papers announce the decease of the notorious Dr. Tanner. It is stated that his death was accelerated by the injury to his constitution in his forty days' fast of last year.

IN the list of subscribers to the fund for founding a prize or scholarship in memory of the late Professor Rolleston, the names of the Marquess of Salisbury, the Members for the University of Oxford, the Postmaster General, the Vice Chancellor and others appear.

A ROLL of bank-notes, value £500, was dropped into the offertory bag at the parish church, Chelmsford, on Sunday week, with a written request that the money should be devoted to the Infirmary. On July 4th, last year, a similar donation was made in the same way for the dispensary. The donor's name is unknown.

SUPERSTITION AND MEDICINE.

THE task of writing an accurate and complete history of medicine has yet to be undertaken, and whoever may succeed in the work will find no lack of instances to show that superstition and medicine have been in close connection at much later periods than the mediæval centuries. It is, perhaps, strange that we are even now unprovided with an historical guide to the growth and progress of the science and art of medicine and surgery; but, nevertheless, the truth remains that, with the exception of some unimportant attempts made in this direction, nothing has been done to present the historical side of the profession for its own examination. When the giant work has been accomplished there will be found much in it to excite wondering astonishment, and not least among the facts detailed will be those bearing on the intimate relations held by superstition towards the practice of medicine. Broadly, this is sufficiently acknowledged to have been a feature in the development of medicine in the past, but it may be doubted whether many who accept so much in respect of it would not vehemently deny that it persists to the present time. That it does so, however, is again and again demonstrated by the record of each week; and in the weightier matters of professional interest, a reference only need be made to

the superstitious reverence with which believers in homoeopathy regard the powers residing in the millionth of a grain of inert matter ; to the incredible confidence reposed in quacks of the most unblushing pretensions ; or to the avidity with which ignorance greets ignorance, if it do but make a show of greatness, to convince of the truth contained in the assertion we have made. This age, no less than any age that is past, is deserving to be ranked among those in which the superstition of the masses has aided the pretensions of impostors, and impeded the progress of science. Happy in the possession of a larger aggregate number of persons unaffected by the prevailing weakness, the country is gradually clearing itself of the obstacles which have worked against it in the past ; and some time it may be that the last will have been heard of the barbarous nonsense that there remains as yet a good deal of in remote districts. The West Country has been always celebrated for the depth of simplicity displayed by its inhabitants, and in the annals of superstition and deceit the Cornish and Devonshire natives have ever held a foremost rank among credulous dupes. Particularly has this been the case when the belief of the ignorant has been of a nature to advance the cause of an unscrupulous pretender to medical skill ; and hence it is that in those far distant spots there continue to live in the minds of the peasants the most extraordinary ideas with respect to the curative properties of divers things.

A contemporary cites as the most recent instance of the length to which this blind ignorance will extend, the case of a native of Torquay, who wore on the middle finger of his left hand a broad silver ring, which he had, he said, constantly worn as a protection against fits for twenty years. The wearer of this original preventive of epilepsy described it as being made of nine sixpences, each the voluntary gift of a different unmarried female, and each unacknowledged by the thanks of the recipients. All these formalities, and others equally absurd, were, he asserted, necessary to ensure the successful working of the charm exercised by the ring ; and it is fair to assume that this particular victim of a gross superstition, was thoroughly convinced of the reality of all that he uttered concerning the article in which he placed such high faith. It is not worth while to dwell on the absurdity contained in such a narrative, save as an illustration of what is undoubtedly a widespread spirit of superstitious belief in extraordinary or unusual remedial measures in sickness, a feeling which, in greater or less degree, is traceable in almost every class of society ; and that it is a dangerous element, that it has exerted, and will exert, a pernicious influence on the progress of medicine as a science, can hardly be doubted for a moment. The sentiment which stifles the reason against the proofs that communicable diseases may be avoided by the adoption of rigid precautionary measures, or that forbids it to admit the truths demonstrated with all but crushing force by experiment, is, in a way, a consequence of the same deterrent spirit ; and with the consciousness that this is so before us, we are driven to inquire how much and how little have medical men themselves done in the past and in the present to banish the evil of superstition. There is not a little in connection with the practice of medicine that admits of being improperly or injudiciously turned to

foster a willingness to believe in the marvellous the vulgar ever exhibits. How many medical men are there who can say they have never, unintentionally perhaps, turned this to account by imposing on the wonder and credulity of the patients they have been called to relieve ?

It may seem strange that we have chosen to write on such a subject at the present time, but we are led to this course because we hope and believe a turning point in the history of medicine has been reached. A new era will date for it from the magnificent Congress which has just completed its labours ; and if the most is to be made out of changes that will arise, there must be no hiding of the facts that go to make the present what it is. In the formation of opinion, doctors have had their share, and that not by any means a small one ; they must recognise to what extent they have been concerned ; and it is for them to so act as shall ensure as much good as can be possible in the future, both to them and to the public they are the servants of. Superstition and medicine have been closely related in the past ; the time has come for the partnership between them to be dissolved, and medicine must be first to disown the association.

Notes on Current Topics.

Public Medicine at the Meeting of the British Medical Association.

THE Section of Public Medicine of the Ryde meeting of the British Medical Association was occupied during the three days of its existence with three very important topics bearing on the prevention of disease. The first discussion was opened by excellent papers by Dr. Strange, of Worcester, and Dr. Davey, of Ryde, the former reading on the "Causation of Typhoid Fever and Diphtheria," the latter upon "House Sanitation" in connection with the prevention of the same diseases. Dr. Strange seemed to lean to the opinion that germs derived from a patient already attacked with typhoid fever must be present in order to excite the disease in other patients. Dr. Davey, in his paper, which was full of interesting cases, showed the extreme importance due to the way in which house-pipes enter the drains ; and exhibited several lamentable examples of leaden pipes, which had been so deteriorated as to offer no obstacle to the admission of foul miasms into houses. Dr. C. R. Drysdale believed in the occasional origin of typhoid fever *de novo*, although it was generally caused by germs ; and referred to the Sanitary Engineering Association, founded by Prof. Fleeming Jenkin in Edinburgh, and its great success. Dr. Carpenter, of Croydon, also gave many examples of the great value of sanitary house inspection for the prevention of enteric fever. Dr. Wilson (Leamington) believed in the origin of typhoid *de novo*, by means of filth. Dr. Charles Smith (Brighton) mentioned that he had only, in a large practice, seen five cases of diphtheria in his life.

The subject of animal vaccination and the origin of vaccinia was debated on Thursday afternoon. Papers were read on animal vaccination by Mr. Ernest Hart, Dr. Martin, of Boston, Dr. Warlomont and Dr. Hodgson,

of Brighton. After these an animated and prolonged discussion ensued, in which Dr. C. R. Drysdale (London), Dr. Charles Renner (London), Dr. Haughton (Norwood), Dr. Alfred Carpenter and Dr. Ransome (Manchester) took part. Dr. Henry Martin's speech was listened to with the greatest interest when he spoke of the millions of vaccinations performed by means of lymph sent out by himself from Boston, as many as 1,500 points of animal vaccine being sometimes despatched daily. He alleged that animal vaccine was far more protective than humanised, and had offered a large sum to anyone who should bring a person to him who had contracted small-pox after being vaccinated by himself, without having had ever to pay this reward. Dr. C. R. Drysdale proposed, and Dr. Renner seconded, and it was carried unanimously, that the Section should ask the British Medical Association to memorialise the Local Government Board to carry out the promise it had made a year ago to introduce the practice of animal vaccination into this country by supplying vaccinators from the calf.

On Friday the Section, at its morning sitting, was occupied with the question of the prevention of scarlatina by the adoption of convalescent homes, and also with the subject of the compulsory registration of infectious diseases. Papers were read by Dr. Beveridge (Aberdeen), in which that gentleman showed how perfectly the system of registration of infectious diseases by the medical men of Aberdeen had succeeded, and how its effect had been greatly to lessen the amount of scarlet fever, measles, and small-pox in that city. Dr. Grimshaw (Ireland) was very vigorous in his approbation of the system carried out in Aberdeen and Edinburgh, and pointed out the absurdity of allowing a shopkeeper to deal out small-pox and scarlatina from his shop to unsuspecting customers. Such persons were the objects of commiseration because, forsooth, they might lose money if compelled to have the existence of some infectious disease known. This was an egregious error. Let them be ruined, he said, rather than that other people should be killed for their sakes. This observation was received with considerable applause. Dr. A. P. Stewart, described a scheme for removing convalescents from scarlatina, but the discussion on this important point was scanty, and the main difficulty of the adoption of such excellent institutions was said to be that, wherever placed, the inhabitants of the district would be sure to petition against them, as they had so often done against asylums for small-pox hospital. On the other hand, it was urged that necessity should compel the establishment of such asylums, for the great end of stamping out infectious diseases.

College of Surgeons of England.

MR. MARSHALL has withdrawn from the Court of Examiners at the College of Surgeons. He will probably be replaced by Mr. Croft or Mr. Christopher Heath. It is not for us to suggest to the Council who should be selected, though we should in all cases gladly see the rule carried out of priority according to date of Fellowship, unless there is some essentially good reason for passing over any particular candidate.

Skin Grafts from the Dead Subject.

DR. JOHN H. GIRDNER details, in the *New York Medical Record*, the history of a case in which he successfully employed grafts of skin from a corpse six hours after death to reproduce the cuticle. His patient had been struck by lightning; the burn, a very severe one, extending over the left arm and scapula, and denuding a very large extent of surface. Having been submitted to different courses of treatment for some weeks, granulation set in over all the affected part, and it was then that Dr. Girdner resorted to grafting, the operation being thus described by him. "Having removed a portion of skin from the inner side of the thigh, where there was least hair, and the skin most delicate, I cut it into a great many small pieces, and applied them, and dressed the surface after my own method, which is to apply first, next to the grafted surface, a piece of the green protective used in Lister's dressing; over this I strap the ulcer with ordinary rubber or adhesive plaster, and over the whole throw a roller loosely. The object of the green protective is to prevent the grafts from adhering to the plaster, and being torn off when the dressing is removed. The strapping is simply to make pressure, which must be firm and evenly applied." The dressings were removed after four days, and the small amount of discharge being washed away, only about a fourth of the grafts were found not to have taken, and a good cure ultimately resulted with comparatively little cicatrisation. The operation was made necessary a second time, however, in consequence of an attack of erysipelatous inflammation, due to the bad health of the patient. Dr. Girdner was the first to employ grafts from the cadaver, and in the case referred to his subject was, in the first instance, a healthy young German, who had committed suicide by cutting his throat. Dr. Girdner concludes that "anyone who has witnessed, as I have done repeatedly, skin taken from the dead body several hours after death again returns to life, adhere to granulating surface, and, with surprising rapidity, send out prolongations of delicate skin in all directions; covering the surface with a new skin, comparatively free from contractions, must agree with me that skin-grafting is in its infancy, and that when men of ability have given it more attention, and found out the possibility of the proceeding, we may expect to see frightfully contracting cicatrices, which follow burns and *nævi*, removed by excision, and their places filled with a skin almost as perfect as the surrounding, and which has been removed from the dead or living body of another person."

The Railway Disaster.

THE occurrence of a shocking collision at Blackburn, whereby several lives have been sacrificed, and much human suffering created, has aroused a feeling of intense anxiety regarding the efficiency of the brakes, to the inaction of which the accident was first ascribed. The number of railways on which the Westinghouse, or some similar form of brake, is now in use, is considerable, and we have long held the view in connection with them that their employment may be attended with certain evils that deserve to be recognised. The inquiry to which the recent disaster will give rise must undoubtedly bring out

all the facts that bear any reference to the mode of action of, and effects produced by, these sudden stopping apparatus. One consequence their use is followed by, is the intensification of nervous excitement in persons of over-sensitiveness, and in not a few cases it is possible to assume that frequent travelling on lines, the South-London for instance, where the Westinghouse brake is in use, has hastened the illness of nervous individuals. On the local lines particularly, where trains are brought up at short intervals with a suddenness and a jerk that are seriously distressing to anyone unaccustomed to them, there ought to be made some endeavour to modify the abruptness of the stoppage. We cannot but think it possible to so employ the brake as to obviate the disadvantages of this description, and it will be a boon to the travelling public if the attention of railway directors is drawn to the subject. The more serious question of how far the brake responds to the call made upon it, is one that will be decided in another place. We cannot but deeply deplore the lamentable accident which has darkened the history of the past week, and hope that out of it may come good fruit in the way of experience for the future.

Inspection of University Lodgings.

THE authorities of Oxford University have at length adopted the wise resolve of appointing a duly-qualified inspector to report on the condition of the licensed lodgings occupied by members of the University. The necessity for this course has been long enough apparent, and Mr. Griffith, C.E., may be trusted to ensure that the life of an undergraduate will not, in the future, as it has been too often in the past, subject to all the dangers of infection from imperfectly ventilated, and badly-drained houses. The town authorities demurred to the action taken by the University officials, and even demand that the Local Board shall be consulted by the licensing authority. This is, however, to be regarded only as an amusing show of indignation, since the townspeople are entirely dependent on the University, and must succumb to any conditions imposed by the latter in defence of its own members. We can congratulate the large numbers of young men compelled to live in licensed lodgings in Oxford, on the prospect now opening, of healthy dwelling places.

Pauperism in Ireland.

IN the annual reports of the Irish Local Government Board for 1876 and 1877 respectively there was noticed a decrease in the average daily number of workhouse inmates for two years in succession.

In 1878 the change was in the other direction; the average daily number of inmates being 1,441 more than in the preceding year, attributable, as we then observed, to the indifferent harvest of 1877, and to the inclemency and wetness of the subsequent season. In the report for 1879 the average daily number of inmates showed an increase of 3,318 over that of the preceding year. In the report for 1880 there was an increase of 3,952 in the average daily number of inmates over the preceding year, while in the report just issued the average daily number of inmates shows an increase of 1,850 over last year.

The out-door relief average for the year 1880 was 3,355 over the preceding year, and the average for the present year is 21,254 over that of last year.

Promotion in the Army Medical Department.

IT is generally felt throughout the Army Medical Department that a strong effort should be made to bring about a quicker plan of promotion to the rank of brigade-surgeon in order to level up the retiring pensions to those recently granted to the officers of the Indian service, and that this grade should be reached not later than the completion of twenty-five years' full pay service in the army. A quarter of a century is a long time to serve without promotion to the higher ranks, and the demand is not at all an unreasonable one. It will be remembered that the recent War Office committee recommended that the rank of brigade-surgeon should be reached at twenty-two years' service, and that of deputy surgeon-general at forty-eight years of age with the view of ensuring more efficient officers in the administrative ranks. Under present circumstances this is hopeless of attainment, and if something is not done the Army Medical Department will suffer considerably, as candidates will undoubtedly look mostly to ultimate retiring allowance as the means of attraction to the army. This rank is also now being more quickly reached in India where army medical officers of longer service are being superseded. We trust Sir Wm. Muir will look into the matter and remedy the grievance complained of.

Hill Stations in India.

ACCORDING to the *Homeward Mail*, military authorities are agreed that every opportunity as far as possible should be taken advantage of to locate British troops in healthy hill stations on their first arrival in India. Two years since a good beginning was made in this desirable direction by the sending of the 30th Foot to Raneekeh, and last year the locating of the 23rd R. W. Foot, at Chakrata, an arrangement which has been found to be most beneficial to the health of those corps." And so on. "A good beginning," indeed! For quite forty years back the system has been to send to the hills regiments and individuals as a means of preserving health, or recovering it when lost. And now we learn that in this respect the "beginning" dates only from two years ago. What does it mean?

The Tzétzé Fly.

M. LEDOULE has forwarded to the Geographical Society valuable information concerning the tzétzé-fly, of which a notice has already appeared in *L'Union Médicale*. All travellers in equatorial Africa have had good reason to notice the destructive power of this insect, the sting of which is death to oxen, horses, asses, camels, and even to dogs. Dr. Kirk, British Consul at Zanzibar, has, at the present moment, a work in preparation on the tzétzé-fly, which he considers to be one of the greatest obstacles to the civilisation of Africa, as it is utterly impossible to employ most beasts of burden in those regions infected by this insect.

A curious fact has been noticed in the post-mortem ex-

mination of animals which have died from the effects of the tzétzé-fly's sting—namely, that there is no lesion whatever of the spleen, liver, lungs, or brain. The symptoms causing death resemble those of glanders. It is supposed that this disease is infectious to animals of the same species.

Hygiene of Light in Schools.

FOR some time past it has been remarked that many cases of myopia have arisen in schools, the existing causes of which are proved to have been defects in the desks and seats, and in the manner of lighting the rooms. The architects of Paris have taken this fact into consideration during the construction of the new scholastic buildings, but it is important that practical rules, based on fixed principles, should be drawn up. The Minister of Public Instruction has, therefore, appointed the so-called *committee of the hygiene of sight in schools* to investigate the matter fully, to study the effect of material objects, school-furniture, &c., on the production of myopia, and to devise some means of correction.

This committee, presided over by M. Gavarret, Inspector-General of Education, counts among its members Drs. Javal, Panas, and Gariel, M. Maurice Perrin, member of the Conseil de Santé de l'Armée, M. Montmahon, Inspector-General of Primary Education, MM. Masson and Hachette, publishers, and M. Ganthier-Villars, printer.

Government Expenditure on the Irish Poor-law Service.

THE following is a statement of the parliamentary grant for medical and educational purposes, and for salaries under the Public Health (Ireland) Act, for the year ended 25th March, 1880 :—

	Amount allowed for the year.		
	£	s.	d.
Medical purposes	72,814	11	2
Educational purposes	9,551	0	5
Total for medical and educational purposes	82,365	11	9
For salaries under Public Health Act	13,848	14	2
Total	£96,214	5	11

The total amount allowed under the parliamentary grant for medical and educational purposes for the year ended 25th March, 1880, namely, £82,365 11s. 9d., is £1,846 6s. 6d. more than the amount for the previous year.

The amount for salaries under Public Health (Ireland) Act, namely, £13,848 14s. 2d., is £141 4s. 7d. more than for the previous year.

IN the principal foreign cities the rates of mortality, according to the latest official weekly return, were in—Calcutta 19, Bombay 37, Madras 41; Paris 27; Brussels 27; Amsterdam 24, Rotterdam 21, The Hague 23; Copenhagen 25, Stockholm 19, Christiana 15; St. Petersburg 56; Berlin 48, Hamburg 33, Dresden 32, Breslau 44, Munich 40; Vienna 25; Prague 32; Buda-Pesth 41; Venice 25; Alexandria 46; Brooklyn 38, Philadelphia, 28, and Baltimore 37 per 1,000 of the various populations.

Rather too Much.

DR. CEBEIRA reports in the *Revista de Catilina* a singular case—a soldier with venereal chancres, buboes, &c., and a scrotum having four distinct testicles—two in each sac—of different sizes. The supernumerary testicle of each side was above the other. The venereal diseases of the patient seemed to be in proportion to his capacity for cultivating them.

Oily Cyst of the Mastoid Region.

M. GILLETTE narrated at a recent meeting of the Paris Surgical Society, the case of a woman, *æt.* 30, who had for a long time had an indolent tumour in the auriculo-mastoid region. The swelling was fluctuating and translucent and was considered to be a serous cyst. On puncturing with an aspirator it yielded an oil resembling olive oil. The patient was seen again three days later; there was no production of the liquid.

Quinine Amaurosis.

THERE is an article in a recent number of the *Archives of Ophthalmology*, by Dr. Gruening, in which he comes to the following conclusions. In examining cases evidently of quinine poisoning with amaurosis, as given by Rossa, Wecker, Wookies, and Gruening, a remarkable similarity is found in their chief characteristics. The patient, after taking one or many successive doses of quinine, suddenly becomes totally blind and deaf. The deafness disappears at the end of twenty-four hours, but the blindness persists, or at any rate peripheral vision is abolished; whilst for the central parts, visual acuteness returns gradually to the normal after some days, weeks, or months. Ophthalmoscopy shows an ischæmia of the retinal arteries and veins, with no inflammatory change.

Seeing the constant nature of these symptoms, and the uniformity of the ophthalmoscopic descriptions, a distinct place must be reserved for this form of amaurosis in the pathology of the optic nerve and the retina.

The use of the Vulcanised India-rubber Bandage.

AT a recent meeting of the Paris Surgical Society (*Le Praticien*) M. See read a paper on the good results which he had obtained in the treatment of the following conditions by the vulcanised elastic bandage :—

1. In oedematous infiltration of the limbs from whatever cause, and especially in the hard oedema of the upper extremity which is met with in women affected with cancer of the breast.
2. In the sero-plastic infiltration which is met with as the result of certain diffuse inflammations.
3. In sanguineous infiltrations and effusions, and in ecchymoses, resulting from contusions or subcutaneous injuries.
4. In articular serous effusions, which are rebellious to all treatment, and especially in hydrarthrosis.
5. In circumscribed or diffuse phlegmonous inflammations at any period of their evolution.
6. In ecchyma and the consecutive ulcer, in callous ulcer, varicose ulcer, &c.
7. In recent wounds, accidental or surgical, united by

ature, the vulcanised band being placed over the anti-septic dressing.

In order to avoid accidents some precautions are necessary; the compression must be slight, and also the traction; the turns of the bandage should be covered for one-third of their width, great care being taken not to leave an interval between them. Lastly, the bandage should be removed every two or three days, to be immediately reapplied after washing with carbolic acid. The advantages of the vulcanised rubber bandage are: its elasticity and impermeability; it forms a barrier against the admission of air; it maintains a favourable warmth and moisture, and exercises a very efficacious continuous slight pressure.

Who is Dr. Beard?

LAST week several members of the International Medical Congress went to the Waterloo Hotel, Jermyn Street, where Dr. G. Beard, of New York, had invited them to witness what he termed experiments in hypnotism, &c., on one of his "trained" patients. The "subject," a young man about 21 years old, was delivering a lecture on temperance in an alleged state of trance. Dr. Beard then proceeded to deal with the patient after the manner of mesmerists, stopping and starting his flow of words by a touch, &c. By Dr. Beard's permission, the suggestion of considering the case in the ordinary medical manner, by obtaining a good clinical history and examining into the patient's physical and mental condition, was adopted, and before any further experiments were tried Dr. Orichton Browne elicited the following facts:—The "subject," a native of Edinburgh, was using an assumed name; he refused to disclose the name by which he was known when in business in that town, although told that the object in asking it was to inquire into his antecedents. He declined to answer questions of a medical nature put to him by Dr. Browne, the examination being in its result perfectly negative as to his credibility as a witness, but bringing out the positive fact that he had been conversant with spiritualism in New York; while he alleged that he had forgotten the names of the "mediums" he had sat with. With a protest from the spectators on the unsatisfactory upshot of the "case-taking" thus far, Dr. Beard was requested to exhibit the phenomena they had come to see.

Various experiments were shown, which in the opinion of the meeting were totally valueless; and finally, Dr. Beard, having stated that the condition of perfect insensibility could be produced, the suggestion was made that this experiment should be tried, admitting, as it would, of the application of the fairly definite test of the infliction of what would in the ordinary state be pain, but which would be, of course, on the hypothesis of the genuineness of Dr. Beard's case, unfelt. To this test the patient refused to submit. The meeting then, at the instance of Dr. Crichton Browne, unanimously expressed the opinion that in the absence of any proof of the genuineness of the alleged phenomena, with the strong probability of the "subject" being an impostor, it was useless to witness any further manifestations, and promptly dissolved itself.

Upon the passing of the resolution condemning the proceedings as an imposture, Dr. Beard quitted the room in fervid rage, at the same time one or two American physi-

cians thanked Dr. Crichton Browne in the name of the profession of the United States for his able and complete exposure.

International Medical and Sanitary Exhibition.

THE Medical and Sanitary Exhibition, organised by the Committee of the Parkes Museum, closed on Saturday last, August 13th, when the number of visitors, exclusive of season ticket holders, was 1,221, making a total of 24,333 visitors for the four weeks during which the Exhibition has been open, allowing only for one visit by each season ticket holder. During the day the Secretary, Mr. Mark Judge, visited the different exhibitors for the purpose of ascertaining their opinion as to the success of the Exhibition. The exhibitors generally expressed themselves as well satisfied with the result, some going so far as to say that they had done an exceptional amount of business, owing to the fact that a very large proportion of the visitors had been either medical men, architects, or engineers. The representatives of the exhibitors, who have been in daily attendance during the Exhibition, marked their appreciation of the arrangements made for their convenience, by presenting, on Saturday, a small purse of gold to the Superintendent, Mr. Smithson. The closing of the Exhibition was taken advantage of by the St. John Ambulance Association, to give a demonstration of ambulance practice, and during the afternoon a large number of the visitors assembled in the Conservatory to witness the practice, which was conducted by Major Duncan, Mr. Cantlie, of Charing Cross Hospital, Mr. Furley, Dr. Crookshank, and Surgeon-Major Baker. Prizes were competed for by squads of the Grenadier Guards, the Finsbury Rifles, and the Metropolitan Police. Mr. John Eric Erichsen (the Chairman), Dr. Poore, Dr. Steele, Mr. George Godwin, Mr. Rogers Field, and other members of the Exhibition Committee, were present during the day. The prizes, which have been awarded, will be distributed at the annual meeting of the Parkes Museum in the autumn.

Ayoub Khan's Troops.

TELEGRAMS from India state that preparatory to his coming struggle against the troops of the Ameer, Ayoub Khan is re-enlisting only men who have previously served as soldiers, no raw recruits being yet pressed. Thus, then, we find a chief among a people not particularly noted for fanciful ideas acting according to the hard teaching of actual war. He has found young untrained levies to be worse than useless, and accordingly he will have none of them. His action in this particular respect may be recommended to the notice of the authorities who rule the military destinies of England.

Poor-Law Medical Officers' Association, England and Wales.

THE annual meeting of this Association took place at the Odd Fellows' Hall, Ryde, on Thursday, the 11th inst., during the gathering of the British Medical Association at that town. The chair was occupied by Dr. Joseph Rogers, of London, who, in an exhaustive address, gave an outline of the work done by the Association during

the year ending June, 1881. Dr. Rogers concluded his address by showing from that which he had mentioned, the importance of co-operation in obtaining concessions which without it could not be secured.

At the conclusion of his speech, which was frequently applauded, it was moved and seconded that a cordial vote of thanks be accorded to Dr. Rogers for his address and for his services generally; and it was also urged that the Association was entitled to the confidence of the Poor-Law Medical Service generally.

The British Medical Association—Visit to Isle of Wight.

THE forty-ninth anniversary of this organisation has been celebrated at Ryde during the present week, under the presidency of Mr. Benjamin B. Barrow, J.P., F.R.C.S., Consulting Physician to the Isle of Wight Infirmary. Preparations were made for the reception of the Association, and the Mayor and Corporation of the borough co-operated with the local reception committee to make the meeting one of interest and of satisfaction. The local honorary secretaries were Dr. J. M. Pletts, Ryde; Mr. W. E. Green, Sandown; and Mr. Joseph Groves, B.A., Carisbrooke. The directors of the Pier Company threw the pier open free to all the members attending the meetings, and a steam launch and wherries were retained for marine trips daily for those who desired to participate in them. Sir William Clifford, of Westfield, the Right Hon. Sir William Hutt, of Apley Towers, and the Rev. A. Loock, of Binstead House, placed their respective grounds at the disposal of the members daily.

COMPULSORY NOTIFICATION OF DISEASE.

The Session opened at 10 on Thursday morning, when a warm discussion took place on the subject of the proposed legislation, by which medical men were to be compelled to return to the register all cases of infection coming under the notice of the practitioner. Towards the close of the last Session of Parliament, a Bill was introduced on the part of the Social Science Association, with the object of making notification compulsory; and, as the Bill also proposes to impose that duty directly upon the medical practitioners in attendance, it is proposed to introduce early next Session, on the part of the Association, a Bill which shall carry out the views which the Association has endorsed.

A resolution on the question was now proposed recommending the Council to give their support to the Bill with this proviso, viz., that while they should be under obligation to inform the householder, or the head of the family, of the nature of the disease, that the obligation to furnish the information to the register should rest with the householder.

An amendment was moved that the Bill be opposed *in toto*, but was lost. It was strongly argued that the obligation upon a medical man to register the cases of illness in a family, would certainly tend to his ruin.

In the end, the resolution was carried by 65 for, and 7 against.

VIVISECTION.

Professor Humphrey moved the following resolution, of which he had given notice:—"That this Association

desires to express its deep sense of the importance of vivisection to the advancement of medical science, and the belief that further prohibition of it would be attended with serious injury to the community, by preventing investigations which are calculated to provide the better knowledge and the treatment of disease in animals as well as in men." Before venturing to propose this resolution he said he had thought long and seriously on the subject, and had mentioned it to a considerable number of the members of the Association, everyone to whom he had spoken about it being of opinion that as there was so much misrepresentation and exaggeration indulged in about vivisection—and he was very sorry that the Legislature was likely to gather wrong opinions in consequence—it was the duty of the British Medical Association to give utterance to its views with no uncertain sound. In the course of his remarks he argued that nearly every advance that had been made in science during modern times, and their knowledge of the movement and functions of the organs of the human body had been acquired by means of vivisection, and referred in eloquent terms to the discoveries of M. Pasteur, as brought to light at the Congress in London.

Mr. Husband, of Bournemouth, seconded the resolution.

On the resolution being put it was carried almost unanimously, one member deliberately voting against it.

HOMŒOPATHS.

Dr. Bristowe and Mr. Hutchinson have both committed the same mistake of introducing into their addresses the question of admitting homœopaths into consultation with orthodox medical practitioners.

Mr. Hutchinson urged that the profession should let go the line of conduct which they had for long adopted with more or less reason, for he believed the course they adopted in reference to homœopathy very much embarrassed their conduct, and placed many in extremely difficult circumstances. He was going to say a few words in apology for some of their works, believing that there were some who were honest amongst them, and concerning whom it was scarcely fair to adopt a hasty dictum that they were either fools or knaves. Before they declined to consult with homœopathy he thought they ought to use some degree of discrimination unless the circumstances were unusual.

The audience strongly expressed their disapproval of the line of conduct suggested by these two eminent practitioners.

FROM diseases of the zymotic class measles showed the largest proportional fatality in Liverpool and Sheffield; scarlet fever in Hull, Nottingham, and Salford; and whooping-cough in Sheffield. The fatal cases of diarrhoea, which had increased from 73 to 776 in the six preceding weeks, declined last week to 533; the death-rate from this disease last week averaged 3·7 per 1,000, and ranged from 0·0 to 0·7 in Plymouth and Wolverhampton, to 5·3 and 8·9 in Nottingham and Leicester. Five fatal cases of diphtheria were recorded in Portsmouth and 4 of typhus fever in Newcastle-upon-Tyne. Small-pox caused 38 deaths in London, one in Liverpool, one in Oldham, and one in Leeds.

THE foundation stone of a new hospital at Plymouth was laid last week by the Earl of Mount Edgcumbe. The building which this will replace has been twice enlarged, but has been found inadequate to the demands made upon it. The estimated cost of the new edifice is £24,000, of which about £10,000 remains to be collected.

THE Council of Liverpool University College, just incorporated by Royal Charter, having collected £100,000 for the endowment of Chairs, have purchased a site for £19,000, covering 13,000 square yards, on which they propose the Liverpool Municipal Council shall erect the buildings necessary, and let the same to them at a lease of 75 years at a nominal rent.

THE annual rates of mortality last week in the principal large towns of the United Kingdom were—Plymouth 9, Brighton 16, Edinburgh 16, Bristol 17, Wolverhampton 16, Salford 18, Dublin 19, Birmingham 19, Sheffield 20, Portsmouth 20, Norwich 20, Bradford 21, Oldham 21, Manchester 22, Leeds 22, Newcastle-on-Tyne 22, London 23, Glasgow 23, Nottingham 27, Hull 28, Sunderland 29, Liverpool 27, and Leicester 30 per 1,000 of the population.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

REGISTRAR-GENERAL'S RETURNS.—The return of births, deaths, and marriages in the eight principal towns of Scotland for the week ending Saturday last says:—The death-rate in the eight principal towns during the week ending with Saturday, the 6th August, 1881, was 21.1 per 1,000 of estimated population. This rate is 1.3 above that of the corresponding week of last year, and 2.9 above that of the previous week of the present year. The lowest mortality was recorded in Edinburgh—viz., 16.1 per thousand; and the highest in Paisley—viz., 25.1 per thousand. The mortality from the seven most familiar zymotic diseases was at the rate of 4.3 per thousand, or 0.2 above the rate for last week.

LEITH.—HEALTH OF THE BURGH.—The number of deaths in Leith during the past week was 27, equivalent to an annual mortality of 25 per 1,000. Of 46 births registered, 3 were illegitimate.

EDINBURGH.—HEALTH OF THE CITY.—Last week the number of deaths in Edinburgh was 69, as compared with 58 in the week previous, giving a death-rate of 16 per 1,000. No cases of fever were reported, and the total deaths from zymotic diseases was 13—4 of which were in the New Town, and 9 in the Old Town, while none occurred in the southern suburbs. During the week there were 146 births, of which 3 were illegitimate.

ANTI-VIVISECTION MEETING IN EDINBURGH.—Last week a meeting was held in the Bible Society's Rooms, Edinburgh, under the auspices of the Scottish Society for the Total Suppression of Vivisection, to hear an address from Miss Frances Power Cobbe, of London. Those only having invitation circulars were admitted, and there was a crowded audience consisting principally of ladies. Miss Cobbe, in the course of her lecture, replied to the remarks made on the Vivisection Bill by Dr. Fraser at the Medical Congress, and declared that the practice of vivisection was morally wrong,

and an iniquitous sin in the sight of God. They need not be discouraged because an army of Professors gathered in London for the very purpose, she believed, of encouraging vivisection, and opposing the creation of lady doctors. Mr. Duncan M'Laren, ex-M.P. for the city, in proposing a vote of thanks to Miss Cobbe for her address, said he had the pleasure of co-operating in the anti-vivisection movement with her while he was in London, and had taken part in the discussion of the question in Parliament. On that occasion particularly he was indebted to Miss Cobbe for a large amount of information. They had done all they could to stop vivisection, but there was a strong feeling abroad in favour of the practice. It was, however, very pleasing to see that the right to indulge in this cruel operation was not being extended, because the Home Secretary, it appeared, had refused to give a licence to one of the professors in their University in Edinburgh. He hoped the Home Secretary would refuse many more, and that ere long there would be no such thing as giving licences to commit a cruelty which he held to be a sin against God. Whatever was morally wrong could not be socially right. He did not believe that any benefit came to humanity through vivisection, and thought that this abominable system was one that should be put down.

THE ABERDEEN MILK EPIDEMIC.—Our readers will remember that towards the end of March and the beginning of April this year an epidemic possessing certain marked peculiarities broke out in Aberdeen. As we have in past numbers given a full notice of the nature and character of the disease we need only here refer to the scientific evidence of Drs. Cossar Ewart and James Watkin. The epidemic, by which 322 persons in 89 households were attacked, was clearly traced to the use of milk supplied from the Reformatory Institution at Old Mill. These gentlemen found in some of the milk obtained prior to the 3rd of April, numerous organisms (micrococci and spores of bacteria), which, in their opinion, were sufficient to account for the disease. Further experiments made, with special reference to the effect of various infected fluids on the lower animals—the conclusion above stated has been confirmed. Milk obtained from Old Mill after the 5th April and taken directly from the cow, contained no organisms, and produced no effect when administered to rats; on the other hand, the milk of the 3rd April not only contained numerous organisms, but proved fatal to rats in from 18 to 24 hours. Further, *pus* taken from an abscess formed near the angle of the jaw in a patient who suffered from the epidemic contained spores similar to those discovered in the Old Mill of 3rd April, and *bacilli* similar to those into which the spores found in that milk germinated; and rats inoculated with a minimal quantity of that *pus* died in from two to four days; whereas rats inoculated with *pus* which contained neither *bacilli* nor spores still survive. Lastly, some of the organisms in the milk of 3rd April were specifically identical with organisms found in the water taken from the cistern in the byre at Old Mill. The report of the commissioners appointed by the Board of Supervision from which the above is taken throws no light on the manner in which the milk became polluted. When taken direct from the cow the milk was perfectly pure, so that it must have become impure during collection and distribution. Had the epidemic been less severe there would probably have been no inquiry, as many of the directors of the farm are important members of the Town Council and the present investigation has given an unpleasant notoriety to the farm. The report concludes with a well merited tribute of praise to Dr. Beveridge, chairman of the Health Committee, for the

prompt measures which he took to suppress the epidemic which, but for him, might have reached most formidable dimensions. Aberdeen is to be congratulated on having so skilled a physician on her council and one so peculiarly fitted to direct her health department.

Royal Colleges of Physicians and Surgeons, Edinburgh.—Double Qualification.—The following gentlemen passed their first professional examination during the July sittings of the examiners:—

James Hayward Hough, Charles Thomas Duoc, George Brown, Ronald Angus Daniel, Thomas Leslie Crooka, Cornelius Buckley, John Cundill Wood, Simon Vincent Daly, Robert Walter Mackinstry, David Lloyd, Thomas Frederic Wetkin Rowlands, Thomas Galland Charis Hesk, Henry Bollingbroke Seymour Curll, John Hanson, Alexander Macrae Bremner, John Adolph Albrecht, John Walter Burbidge, Thomas Williams, Ernest Offord Stuart, John Salter Gettings, Arthur Hawkyard, Henry Arthur Lowndes, Winton Dickson, Joseph Spisbury Smith, Edward Ellis, John William Irvine, William Caesar Hamilton, Robert Lowry Dickson, John Greenha'gh, Thomas Edwards, Ernest Westbrook, Robert Grant Adamson, Robert Ashburner, Maurice Cussen, Henry L. Thornton, Edward Hodges Soggin Phillips.

The following gentlemen passed their final examination and were admitted L.R.C.P. Edin. and L.R.C.S. Edin. :—

William Bain, Francis Edward Cane, Charles Thomas Duoc, Robert Baird, John Muirhead Watson, Thomas Arthur Wise, William Richards Parry-Jones, Kenneth Alexander James McKenzie, Dugald Christie, William Robert Turner, James Armstrong, Michael Carmody, Charles Pope, Arthur William Sperton Brydges Burrett, George Hollies, Charles George Eyre Naylor, Edward Murray Laftan, Eliza Hodgkinson Monks, William James Spence, George Pearce Baldwin, St. David Gyoalis Waltes, Albert Victor Wheeler, Arthur Ewen Yates, William Kyd Aitken, William Bradshaw Paulin, John Nagle Jeffries, James Henry Ferguson, Frederic Theodore Underhill, Basil Ronald, Thomas Guilanua Munyard, David Lloyd, Arthur Woodrige Alrich, James Hunter Dryden, Richard Francis Walsh, James Patrick Casey, Andrew Stewart, James Garry, William Charles Griffiths, James Dunlop Dunlop, James Joseph Taylor, Arthur Kimberley Scattergood, Francis Joseph Power, Peter Dunlop.

Royal College of Surgeons, Edinburgh.—Ralph Barry Stoney passed his first professional examination during the July sittings of the examiners, and the following gentlemen passed their final examination and were admitted Licentiate of the College :—

George Andreas Berry, Alexander Matthew Moore, Robert Smith, Charles William Sharples, Thomas Andrew Dickson, Patrick Richard Dennehy, Thomas William Shepherd, John Leonard Atherne, Richard George Minchin.

The following gentlemen passed their first professional examination for the Licence in Dental Surgery of the College :—

Matthew Finlayson, David Monroe, John James Bailey, Thomas Mansell, John Sedgwick Spain, Henry Blandy.

The following gentlemen passed their final examination, and were admitted Licentiate in Dental Surgery :—

John James Bailey, Thomas Mansell, John Sedgwick Spain, Robert Peel Thomson.

NOTICES TO CORRESPONDENTS.

MR. C. H. WILSON (Ventor) will receive our thanks.

DR. VIVIAN POORE will deliver to-morrow (Thursday) at the Royal College of Physicians, London, at 5 o'clock, the Bradshaw Lecture on "Nervous Affections of the Hand." The College has this year come in for the legacy from the income of which a lecture is to be delivered yearly on August 18th, the birthday of the legatee.

DR. MOORE.—The "Students' Number" for 1880 is quite out of print.

DR. MAYER.—Yes; Goltz and Ferrier. Hitzig's views do not coincide with those held by Goltz, and the demonstration held at King's College cannot be said to have settled the question one way or the other. You are not the first to have suggested the difficulty presented by comparative anatomy; indeed, we referred to it in our last, two days before your letter reached us.

A. G.—We are very sorry for you, but what else could you expect? The fact that it followed immediately on the Congress made it unlikely many would attend, and all chance of a good meeting disappeared when the place was fixed out of London.

ERNEST.—We would strongly advise you against doing anything of the kind. Nothing but trouble can arise from it, and trouble which would of necessity fall with heaviest weight on those dependent on you. Six months at the most will bring all straight. Be advised then and wait.

MR. EDWARDS.—If you will call at the office you shall have a personal answer.

DR. WANKLYN AND THE ROSBACH WATER Co.—Letters referring to the Rosbach Water have been forwarded to the analyst and will be noticed in our next issue.

DR. BAYES.—We cannot publish a private letter.

Vacancies.

Brighton and Hove Dispensary.—Resident House Surgeon. Salary, £140. Applications to the Hon. Sec. by September 5.
Children's Hospital, Birmingham.—Assistant Resident Medical Officer. Salary, £40 per annum, with board. Applications must be sent to the Secretary not later than Aug. 31.
Cootahill Union, Tullyvin Dispensary.—Medical Officer. Salary, £100, and £20 as Medical Officer of Health. Election, Aug. 29.
General Infirmary, Northampton.—House Surgeon. Salary, £125 per annum, with furnished apartments, &c. Applications to be sent to the Secretary on or before Aug. 29.
Royal Veterinary College, Camden Town, N.W.—Lecturer on General and Special Physiology. Salary, £120 per annum. Applications should be forwarded without delay to the Secretary.
Sussex County Hospital, Brighton.—House Surgeon. Salary, £20, with board, and fees additional from pupils. Applications to the Secretary before Aug. 24.
Swansea Hospital.—Resident Medical Officer. Salary, £100 per annum, with board. Applications to the Secretary not later than Aug. 23.

Appointments.

BARTAME, J. S., M.R.C.S., Resident Medical Officer to the East London Hospital for Children.
BENNETT, F. J., M.R.C.S., L.D.S. Eng., Dental Surgeon to the St. Mary-lebone General Dispensary.
COOPER, G. A., M.R.C.S., L.S.A. Lond., Medical Officer for the Second District of the Ormskirk Union.
GABRIEL, E. W. B., L.R.C.P. Ed., M.R.C.S., Medical Officer of Health for the Cheshunt Urban Sanitary District.
GOSTON, J. K., L.R.C.P. Lond., M.R.C.S., Medical Officer of Health for the Borough of Tynemouth.
HARPER, J., M.R.C.S. Eng., House Physician to the Royal Hospital for Diseases of the Chest, City Road.
HILL, A. B., M.D. Glas., L.R.C.P. Ed., L.S.A. Lond., Public Analyst for the Borough of Leamington for one year.
HUXTABLE, L. E., M.B., C.M. Edin., Assistant Medical Officer to the Border County Asylum, Melrose.
JONES, D. J., M.D. Edin., M.R.C.S., Junior Assistant Medical Officer of the Kent County Asylum, Barming Heath, near Maidstone.
NEALE, W., L.R.C.P. Ed., L.R.C.S.I., L.A.H. Dub., Medical Officer to the Mountmellick Dispensary District and to the Workhouse of the Mountmellick Union.
NIXON, G. E. F., L.R.C.S.I., L.A.H. D., L.M.R.C.S.I., Medical Officer and Public Vaccinator for the Shrivvenham District of the Farington Union.
PRIEST, A., L.R.C.P. Ed., M.R.C.S., L.S.A. Lond., Medical Officer of Health for Waltham Holy Cross Urban Sanitary District.
SHAPLEY, F., M.R.C.S., L.S.A. Lond., Assistant Medical Officer to the Glamorgan County Lunatic Asylum, Bridgend.
THOMSON, D., M.D., G.M. Glas., Medical Officer for the Barton District of the Luton Union.
TURBON, J., M.R.C.S., L.S.A. Lond., Medical Officer and Public Vaccinator for the Hemkmondwyke District of the Dewsbury Union.
WADE, A. L., M.D. Dub., L.R.C.S.I., Senior Assistant Medical Officer Kent County Asylum, Barming Heath, near Maidstone, has been appointed Superintendent of the Somerset and Bath Lunatic Asylum, Wells.
WIGNER, Mr. G. M., Public Analyst for the Greenwich District until June 8th, 1882.
WILSON, J., M.D. Aber., L.R.C.S. Ed., reappointed Medical Officer for the parish of Old Meldrum, Aberdeenshire.

Births.

ALLEN.—Aug. 4, at Wellington Square, Hastings, the wife of Dr. Allen of a daughter.
CHAUMONT.—Aug. 5, at Woolston Lawn, Southampton, the wife of Professor F. de Chaumont, M.D., F.R.S., of a son.
CLARKE.—Aug. 4, at Castleblayney, the wife of John P. Clarke, L.R.C.S.I., of a son.
GREENWOOD.—Aug. 8, at 178 Cold Harbour Lane, Camberwell, the wife of A. Greenwood, L.R.C.P. Lond., of a daughter.
HARDWICKE.—Aug. 12, at Parton Lodge, Sheffield, the wife of Herbert Junius Hardwicke, M.D., F.R.C.S., of a son.
ROWLAND.—Aug. 8, at Gloucester House, Malvern Wells, the wife of H. M. Rowland, M.D., of a daughter.

Marriages.

MACNAMARA—DOORLY.—June 27, at the Cathedral, Fort of Spain, Trinidad, W. I., Rawdon Macnamara, Assistant Colonial Surgeon, to Annie Jane, second daughter of the late Major M. Doorly, Sierra Leone.
NANKIVELL—THRELFALL.—Aug. 9, at the Parish Church, Lytham, Lancashire, Frank Nankivell, M.D., of Broad Hayes, Bourne-mouth, youngest son of T. H. Nankivell, M.R.C.S., of Bootham, York, to Margaret, second daughter of the late Thomas Threlfall, of Edenfield, Lytham.
WHITTLE—PRESTON.—Aug. 10, at St. John's Church, Lewisham High Road, Ewing Whittle, M.D., M.R.I.A., of Liverpool, to Edith, fifth daughter of Charles Preston, Amersham Road, B.K.

Deaths.

BURNHAM.—June 14, Dr. George Burnham, of Peterborough, Canada, aged 67.
CROSSE.—Aug. 2, at Malda Hill, W., Thomas Henry Crosse, M.R.C.S.E., in his 75th year, eldest son of the late Lieut.-Col. Joshua Crosse, K.S.F., formerly of H.M. 38th Regiment, and of Oval St. Crosse, Lyonshall, Herefordshire.
JENNINGS.—Aug. 10, at Market Street, Wakefield, Frederick Cook Jennings, M.R.C.S., L.S.A. Lond.

ADDRESS IN SURGERY,

DELIVERED AT

THE BRITISH MEDICAL ASSOCIATION.

Held in Ryde, August 9th, 10th, 11th, and 12th, 1881.

By JONATHAN HUTCHINSON, F.R.C.S.,

Professor of Surgery and Pathology in the Royal College of Surgeons; Senior Surgeon to the London Hospital, and to the Hospital for Skin Diseases; Consulting Surgeon to the Royal London Ophthalmic Hospital.

MR. PRESIDENT AND GENTLEMEN,—As we are most of us fresh from a long week's carnival of medical science, I feel sure that you will not desire that I should, on the present occasion, address you on any subject directly connected with surgical practice. The very successful and industrious Congress which concluded yesterday has had its numberless Section meetings, in which most of us have taken some part; and, if I do not misinterpret the general feeling, it is a longing for a little rest as regards the matters in the discussion of which we have so recently and so fully engaged. I purpose, therefore, to employ the hour which you have done me the honour to entrust to me, in bringing under your consideration certain general topics having reference to surgical ethics, surgical education, and, lastly, the best means of advancing the clinical knowledge of disease.

Five-and-twenty years ago, the surgeons of the metropolis were alarmed, I might almost say scandalised, by a proposal to open a hospital for the treatment of stone and diseases of the bladder. A memorial was got up, and signed first by the ever respected name of Brodie, and then by almost the whole of those then connected with the general hospitals. This memorial severely condemned the multiplication of special institutions, and with particular vigour denounced the one in contemplation. Amongst the names at its foot, mine may be found. I am not ashamed of having signed it then, but I unhesitatingly say that I would sign no such

memorial now. Nor can I believe that many of those who then did so would now differ from my present conclusions. Not that the facts then stated have been materially changed, but others have been added. Year by year, we have seen more clearly that, in large communities, special hospitals will develop, and that it is beyond the power of the profession to prevent them. But we have seen more than this: we have seen that they are clearly a gain to the public; not an unmixed gain—for what gain is unmixed?—but still a gain. Even at the time when the memorial to which I have referred was written, it was a matter of necessity to admit that diseases of the eye constituted an exception, and some thought that orthopædic institutions should also be permitted. Since then, I suppose that those for diseases of women, for diseases of children, and perhaps for diseases of the skin, have justified themselves.

The final triumph of ovariectomy did not result from any new discovery. There had been many pioneers. The instruments and the modes of practice which had been devised by others were those which were still employed; but these, in the hands of able surgeons, who gave their whole time and energy to this one subject, and who had, above all, the power of excluding from their special institutions those sources of evil from which a general hospital can never be wholly free—attained for this operation its present proud position. Let us note carefully the two elements of success. It may be that Listerism, or some equivalent precautions may, in the future, make the wards of a general hospital as safe a place in which to open the peritoneal cavity as is a private home or a special hospital; but, even if this be done, they can never supply the familiarity with detail which comes only from constant practice. We must never forget that our profession exists, not for the benefit of ourselves, still less of any special class amongst us, but for our patients; and that its institutions must be so managed, or so modified, that they shall best serve their permanent interests. Nor can I think that there is any real difficulty in making the two coincide. Let the profession set its face, not against specialisms as a whole, but rather against those institu-

tions which are conducted in a narrow spirit. Let it insist upon open election of officers, free admission of students and practitioners; above all, let it encourage the formation of special departments in our general hospitals, since it is clearly here that they can best be made useful in the education of the student.

These general principles of conduct being granted, I would not oppose the beginning of any speciality, however detailed. Already the comprehensive department of eye-diseases is submitting to some process of natural subdivision, and it will not be long before we shall have in our large cities those who devote themselves chiefly to operations on the eye, those who attend specially to its diseases properly so called, and those who rectify its congenital or acquired defects by means of optical aids. It by no means follows that because a man is a good operator for cataract, he will be equally familiar with the details of astigmatism. It is impossible to question the fact that the great discoveries in ophthalmology, have been made by specialists, and sometimes by those who had devoted their attention chiefly to special branches of that department. Let it be understood that I am not arguing in favour of the promotion of subdivisions of surgical labour, but rather to the effect that, when they come naturally, we should not oppose them. Let us have charity for the various motives by which different men are urged to different courses; let us hold high our standard, inscribed "for the good of all," and allow to natural energy a full and free development. Let us not waste our time in opposing, but seek rather to employ and use.

I rank amongst the gains from the detailed cultivation of special branches of medical pursuit, that it has a definite tendency to destroy specialisms as such, and add their conquered territory to the general possessions. Whilst it does this to a large extent, it also at the same time creates new departments before unthought of, into which science pushes its way, and gives its help towards the mitigation of the many disabilities of man.

Witness what was done in ophthalmology; how discoveries one after the other have been made, which have been at once added to the knowledge of the general physician. Note how the ophthalmoscope has taken its place with the stethoscope as an indispensable aid to the physician in the diagnosis of disease. The knowledge of diseases of the eye has indeed rapidly attained in the profession at large, and not alone amongst specialists, a very high degree of perfection. I do not hesitate to assert that there are few departments of practice so well and widely appreciated, and few which more definitely attract the attention of students. Nor do the gains to the public from this increase of general knowledge represent the whole gain; for the study of eye disease must be claimed as especially useful as a training in the art of precise observation. No student masters it who does not become in so doing much better fitted for other fields of clinical research. This study is indeed in relation to other branches of surgery almost what mathematics is in general education. We have but to reflect on such facts as these, and next try to recall what the ignorance of eye-disease was less than a century ago and what the position held by the oculist and the spectacle-vendor, and we shall be able to estimate a part of the debt which we owe to specialists.

There was a time when diseases of the skin were regarded by the higher class of surgeons with feelings almost allied to contempt. They were repulsed alike in the portrait, and in the person of the patient. They required no operations; and a knowledge of the use of arsenic, and of the constituents of a few ointments and lotions, was held to be all that was needed for their treatment. Then followed a period during the early cultivation of the speciality, when to outsiders it seemed as if it offered only an arena for endless wrangles as to schemes of classification, and for ingenuity in the devising of new names, and affixing to them a countless variety of unclassical adjectives. I am not quite sure

that this era is even yet wholly passed away. It may be that there yet lingers a feeling of prejudice to this speciality amongst some who should know better. With the majority, however, and especially amongst our rising pathologists, a wholly different conviction is rapidly superseding such feelings. We are learning to ~~know~~ little about names, and to seek knowledge as to the nature of things; and those who do this in earnest rapidly find out that, of all the departments of pathological and clinical research, there is none which offers such rich and varied attractions as does dermatology. The simple facts that a morbid process in the integument is, from its beginning to its ending, exposed to view, that the aid of the lens may be brought to bear upon it while yet *in situ*, and that the histologist is in very many instances not obliged to wait the death of his patient before he is allowed to gratify his thirst for knowledge of ultimate details, largely justify my assertion. But it is not upon them solely that I rely, when I assert that diseases of the skin ought to be regarded as fundamental in professional education. Many illustrations which they afford of the changes in vascular supply and its results; of the influence of the several parts of the nervous system in the production of disease; of the laws of inheritance; of the numberless varieties in the inflammatory process in connection with diathesis, idiosyncrasy, and special forms of poisoning; are far beyond those afforded by any other department—varied and instructive. Above all, we find in dermatology the most remarkable and conclusive proofs of the direct connection between morbid causes and their effects. I cannot doubt that, possessing these advantages, skin-diseases must in the future be accepted as not only of the utmost interest for themselves, but as invaluable to the physician and pathologist in the elucidation of the phenomena of diseased action, as met with in regions and organs less open to inspection. I by no means claim for this insight into the educational value of a knowledge of skin-diseases that it is wholly of modern growth. It was recognised long ago by the Paris physicians; and the work done by Anthony Todd Thompson, by Jenner, Gull, and above all by Addison, attest to its partial recognition amongst ourselves. But its growth is only recent, and never had dermatology such an army of workers who are not specialists as it at present claims amongst the younger physicians and surgeons, not only in London, but in all parts of the world. In their hands, it is certain before long to assume that foremost place which I claim for it as its natural position.

Let us remember, respecting a large majority of the maladies which it has been the fashion, in some sort, to stigmatise as "skin diseases," that nothing is more certain than they belong mainly to other departments of pathology. Herpes is a neuritis which simply chances to display some of its symptoms on the skin. Morphœa is an affection of the vaso-motor nerve, leading to changes in bones, muscles, and joints, as well as to those which, from occurring externally, first attracted attention, and still almost monopolise it. In the study of ringworm, we may engage, if we will, in the most interesting investigations as to the laws of life in minute vegetable organisms. Leprosy offers us a dietetic problem of at least equal interest with those which concern gout and rickets. In psoriasis and its allies, we study a heritable peculiarity of health or of skin which shows its effects through a whole life, and is influenced for better or worse in ways that are curiously instructive. Who can doubt the power of drugs who has seen arsenic cause herpes or cure pemphigus? The polymorphism of syphilism is a fact to claim the permanent wonder of all who are well instructed in pathological speculation.

We listened, with delight, last week, to the eloquent words in which, in his opening address, Sir James Paget enforced the duty of charity amongst ourselves. It is in this spirit, I think, that we should meet the various questions which open out in connection with the medical

education of women; and, that, also, as to consultation with those who, whilst educated amongst us, have openly professed their adoption of peculiar doctrines. I fear that I am here venturing upon ice that is very thin indeed; and I must proceed either with great boldness or extreme caution. I shall prefer the latter. Let me say, then, that the profession of medicine always has offered, probably always will offer, peculiar attractions to those who, with weak principles, and still weaker consciences, desire to make profit by trading on the credulity of their patients. The thing is so exceedingly easy to do. Our real knowledge of disease in many of its departments is very vague, and our knowledge of therapeutics still less certain. There is room on all sides for differences of opinion, and scope for the introduction of new theories and the employment of high sounding epithets. The fatal facilities thus afforded to the charlatan have naturally made the well principled professors of physic very vigilant in guarding our ranks against the introduction of quackery. We wish to be honest, and we wish to associate with none but those who are so. There lived, now more than a century ago, a talented and learned enthusiast, who thought—sincerely, I have little doubt—that he saw his way to an immense reform in the use of drugs. That reform was needed, we all admit. He noticed a few common facts, such as the marvellous subdivision of which odorous substances are susceptible; the change of effect, or even reversal, which accrues from change in the dose of a drug; and that, respecting some few medicines, it was true that they seemed to produce in large doses just what they tended to repress in small ones. I am not here to apologise for Hahnemann. His facts were few, his reasoning illogical, his ignorance of the natural progress of disease and its tendencies to spontaneous recovery, such as would be utterly disgraceful in the present day. Whatever foundation we may grant for his theories, he certainly pushed them to the wildest lengths. His self-confidence, had it been properly balanced, might have become almost sublime.

If, however, we may find theme for marvel in the presumptuous self-sufficiency of this would-be reformer, I do not think that we need seek far for the explanation of the success of his teaching. It inculcated faith in drugs, but it changed their form, and gave us cleanly globules and tasteless fluids for the bolus, pill, and potion, then in vogue. It supplied a theory of cure, as well as its means; and to the intelligent, but, at the same time, not specially trained, its theory sounded at least as good as those of orthodox physic. The love of novelty conspired with a cheerful faith in the possibility of progress, and with delight in escape from the disagreeableness of the old methods, to draw converts to the new creed. Those converts were not the ignorant, nor were they the poor. No wonder that some from our own ranks should have thought they saw their interest in adopting the new method, and equally little that most of those who observed their conduct held the motives of the man who put "homœopath" on his door to be low and self-seeking. In nineteen cases out of twenty, probably the verdict was right; but when the fiat went forth that a homœopath must be either a fool or a knave, I doubt whether the modesty of nature was not somewhat overstepped. There are fools and fools; and we are guilty alike of unkindness and unfairness if we widen that disrespectful epithet over much, and apply it too freely. There is such a combination of weak power for the estimation of facts, with enthusiastic optimism as regards possible progress, which, whilst it in no degree establishes a claim to wisdom, yet scarcely brings its possessor into the category of fools. Amongst the laity of those who became homœopaths, most were of this character, and some, probably, of those who seceded from our ranks.

I fear that it may be thought that I am travelling very far from the proper subject of an address on surgery. I also much fear that I may be misunderstood. What,

it will be asked, has homœopathy to do with surgery; and why introduce the question of consultations with homœopaths with such a lengthy prelude? Now, it is precisely because homœopathy has nothing to do with surgery that it becomes of interest to us to settle the question in dispute. The circumstances of Lord Beaconsfield's illness are fresh in the memory of us all. We did honour to Sir William Jenner for his stern and manly refusal to have anything to do with what he thought quackery. We sympathised with Dr. Quain in his perception, that the occasion had arrived for the sacrifice of sentiment and the performance of a disagreeable duty. But what particularly struck me in the transaction, and what constitutes my chief reason for mentioning it now, was the reason alleged by Sir William Jenner why he could not meet Dr. Kidd. It was not that he felt compelled on principle to decline all intercourse with the heterodox, but that the patient could not possibly be a gainer by a conference between those who held such different opinions respecting the principles of therapeutics. It is clear that, had it been the aid of a surgeon that was needed, no such reason would have been valid. Homœopaths have not as yet succeeded in developing any new system of surgery. The knife and the catheter are the same to them that they are to us, and are used on the same indications. I never, myself, wittingly consulted with a homœopath; but I believe that I have, without knowing it at the time, several times met them, and I never yet encountered the slightest difference of opinion. The surgeon, then, cannot feel that he is in any way serving the interest of his patient when he refuses to meet his weak-minded doctor. On the contrary, it may easily be the fact, that he knows that it would be the greatest possible kindness if he would go without an hour's delay. To Boycott a quack on principle is one thing, to attend to the interests of the quack patient may be another. Hence the duties of surgeons in this matter, and especially of those engaged in consultation practice, have always been very difficult. The obvious incongruity which exists in the case of a physician is not present to the surgeon; his temptations are both more frequent and stronger, and his sources of inward strength are also fewer. He refuses neither for his own good, nor the patient's good, but in obedience to professional rule. With a few exceptions, this rule has been, I believe, honorably upheld by the consulting surgeons of England. There have, however, been some exceptions, and there have been difficulties and annoyances without number. We cannot possibly, in our profession, have one rule for the peer and another for the tradesman. I avow my deliberate conviction that Dr. Quain, and those whose counsel he sought, interpreted the obligations of our profession correctly. We enjoy a law-established monopoly in the art of healing, and we must be very careful how we stint or refuse our services when they are demanded. If, in consultation, it be found that the opinion of the consultant is not that of the consulter, and if the latter be not ready to waive his own, then the proper course of conduct is clear. But, such inability to act in concert should not be assumed on light grounds surely, or hearsay evidence. Unless the previous knowledge be very special, it should be established at the bedside in each individual case. I am speaking of formal consultations only, not of social intercourse. We know well how to accord and refuse professional honour. If a man be guilty of non-professional conduct, we can blackball him at a society, and avoid his company in social life. We enter upon a course of conduct which needs a wholly different justification if we refuse to meet and confer with him, when the life of a third person is concerned. Here I confess that it seems to me that the claims of the public should stand first, and that if a man's name is on the *Medical Register* we ought to meet him, so long as the consultations result in that which we deem most for the patient's advantage. Whenever they do not, our duty is clear,

and we should readily know how to perform it. Many advantages would, I think, result, if we were to leave with the licensing bodies the responsibility of decision, as to who are to be admitted to the privileges of formal consultation, and who excluded. To do so would save at once much loss of time and temper, and avoid frequently recurring complexities. It would encourage honesty and openness of conduct, and remove temptation to the secret perpetration of that which is known to be against the professional rule. But, above all, I would urge that it seems to be almost a matter of justice to the third party, our patients, who have surely a right to assume that, when a duly qualified man is employed, they can obtain, in consultation with him, if wished, the aid of any other, who possesses the same diploma. That we run the risk of fostering homœopathy by according to its disciples the courtesy of professional consultation, I do not for a moment believe. It has hitherto been fostered by opposition. Let us have more confidence in the vital energy of truth, and let us venture to let the wheat and the tares grow together till the harvest. We believe that its principal theory is absurd, and much of its practice ridiculous; but, at the same time, we are prepared to admit that gleams of a fruitful suggestion may be occasionally discerned in its discussions, and we can surely afford to leave it as a whole to itself, and let it develop to its natural end. (a)

I will pass to a less distasteful topic, and proceed to make some suggestions as to the possible improvement in our methods of clinical teaching. It must be noted, in the first place, as a great defect in our English system that it makes no provision for retaining the services of good clinical teachers. It trains them, and then casts them adrift. The early period at which our surgeons and physicians retire from hospital work is a matter of amazement to our foreign *confrères*, and few can doubt that the evil is on the increase. Either by the bribe of private practice, or the gentle compulsion of a retirement rule, we induce our best teachers to desist from work in public just at the time when their services are of most value to the student. The names of Paget, Jenner, Erichsen, Gull, and Bowman will occur to us all in illustration of what I assert. Not only do our customs make the early retirement of successful men a matter of necessity, but they often cramp their usefulness to the student during the latter part of the period of their tenure of office, and also hinder their services to science in other directions. Success in our profession means absorption of the whole time and whole mental energy in attention to private practice. No individual surgeon can help himself; he is in the meshes of the social net, and escape is hopeless. It is a change of custom which must effect the reform, and surely such a change is urgently required. It might come, I think, very suitably in some such form as this: Let there be constituted a rank of pure consultants, whose fees shall be so modified as to enable them to make the same incomes that they now do with a third of the personal labour. Let election to such grade be by their respective colleges. Let us no longer leave the time and the energies of our foremost minds at the mercy of any wealthy man who, however trivial may be his ailment, determines to have "the best advice," just as he would seek the most expensive jeweller, or buy the most costly wine. They are surely too valuable for that. By the plan which I suggest, leisure would be

left to them for study and for teaching, and they would be retained in their proper sphere of public work. Such consultants, having voluntarily restricted their spheres of observation of disease in private, would find it necessary, in order alike to sustain reputation and keep abreast with progress, to retain their public appointments and to continue to teach. The gain would be a great one to medical education, and also, I think, to the public interest. The evil to which I refer is an increasing one, and it exists to a far greater extent in London than in any other capital.

A large part of the education of students may very suitably be done by young professors. Age adds but little to the ability to deal well with the facts of anatomy and physiology, and it may even detract from it. When, however, we come to the knowledge of disease at the bedside, and the correct estimation of its various symptoms, then experience must tell. Without it there can never be that trust on the part of the student, or that free power of illustration, from facts which have been personally observed, on the part of the teacher, which are essential to success.

Yet it is precisely this clinical teaching which is of most importance to the student, and in which, if I mistake not, our modern system is most at disadvantage. Apprenticeships have been abandoned, and few that remember their inconveniences can wish to revert to them. Yet they had their uses, and those not trivial ones. They unquestionably often secured to the student a clinical and practical training which is now but too often missed. Permit me to make for your consideration a suggestion of a plan by which possibly most of their advantages might be retained, and others which they did not always possess secured. Let us endeavour to widen the basis of medical teaching, and to enlist, as responsible partakers in this all-important work, a large section of the profession. This might be done if our examining boards were to recognise as private teachers all fellows of their respective colleges, all possessors of diplomas of the higher class, all medical hospitals and dispensaries—indeed, all who could bring proof of the possession of special opportunities or qualifications for clinical teaching. Let it be required of every student that he should bring, in addition to those now required, certificates from two, three, or more of these registered teachers that he had been—in a real and *bond fide* manner, under their personal supervision—instructed in practical matters, and that he was, in their opinion, qualified for a diploma. Make such certificates necessary, but let them not modify in the least the curriculum of the school or the test examination. To prevent these certificates from being signed in a perfunctory manner, let it be the rule to inform those who signed them of the results obtained by their *protégés*; and if, in the course of a five years' period the proportion of rejections should be more than the average, let the name of the teacher concerned be for the next five years removed from the list of those privileged to sign. This plan would, I think, work well in many ways. It would add to the value of the higher diplomas, and increase the number of those who seek them. It would encourage in those registered as private teachers the endeavour to keep well instructed in the knowledge of the day, whilst its advantages to the student—by bringing him into closer personal contact with those interested in his success—are obvious.

How various are the qualifications which are to be desired in the medical practitioner. He should be a gentleman of good manners and address; skilled alike in the principles of biology and in the knowledge of character; able to visualise at short notice the details of human anatomy; and he should carry in his memory, ready for prompt use, the best recipes for a thousand varying forms of ill-health. If we measure his responsibilities by the possibilities of his usefulness and the risks of his failure, they are very great indeed. It may be true that the greater part of his duties are routine,

(a) These paragraphs concerning consultation with homœopaths did not form part of the address, as given at Ryde. They had been written for our delivery; but on the evening before, I learnt that the same subject had been far more ably dealt with by Dr. Bristowe in his Address on Medicine. The explanation of our having selected the same subject is easily given. Dr. Bristowe dealt with the whole subject, whilst I have spoken only as to the inexpediency of continuing to refuse formal consultations. I have reinstated these paragraphs, in consequence of a general request that they should appear when the address was printed.

and easy of performance; but he may, at a moment's notice, be called upon to deal with the unusual and difficult. Regarded from this point of view, the amount of knowledge required of him is enormous—greater, probably, than that necessary in any other avocation. It is, further, steadily on the increase; every fresh discovery brings with it something fresh for the general surgeon to master and retain in memory. Hence many of the increasing difficulties in surgical education; hence unquestionably the increasing ratio of plucks to passes at our examining boards. It is not that examiners are more strict, students less able, or teachers less zealous; but simply that the thing to be taught has grown in bulk, and become, year by year, more and more difficult of attainment within the allotted period. There is nothing whatever to discourage us in the fact—much, indeed, to tend in the opposite direction. But we must boldly meet the changed and ever-changing circumstances. An extension of the period of study; a well-considered limitation of its subjects; and, lastly, a careful development of its methods, are the three measures which severally suggest themselves. The last is, of course, approved by all, and is too obviously desirable to need comment; but concerning each of the others there is room for much debate. As to the extension of the compulsory period of study, such proposals may, I think, be dismissed with the remark that the practice of liberal rejection of candidates imperfectly qualified really amounts to the same thing, and attains its end with more justice to the diligent and able. In the future it may, perhaps, come to be considered a great credit to pass the first time, and no disgrace to be referred. Careful men, appreciating the necessities of the case, will probably voluntarily lengthen their period of study. Were the period compulsorily fixed at five or six years instead of four, the careless would still, as now, idle till near the end of it. I cannot but think, therefore, that the practice of early examination, with its necessary result of many rejections, works on the whole better than would any which should make an indiscriminating demand for longer time.

It is impossible not to regard without the utmost jealousy any proposal that the subjects of professional study be reduced. So far from its being desirable to strike out botany and comparative anatomy, we might prefer to see added, if possible, a good knowledge, not only of the anatomy and functions, but also of the diseases of both plants and animals. It is from a broad education in these directions that we may hope for future advance. Having said this, however, we must hasten to admit that a large majority of the profession are to be trained, not so much as biologists, nor even as pathologists, but as practitioners. In our surgical education there is much that is valuable, very much indeed that is of the greatest possible interest, concerning which it still cannot be said that it is essential. It is certainly the duty of both teacher and examiner to draw a strong and clear distinction between essential and non-essential acquirements. Howsoever the latter may fare, the public has a right to demand at our hands that the former shall be in as complete possession as possible. It is no comfort to a glaucoma patient, who has been treated by lotions and leeches until he is blind, to know that his surgeon is a good anatomist; nor will the most excellent knowledge of histology avail to save a practitioner from something in its nature not unlike manslaughter who believes that he ought to wait for tympanitis and stercoraceous vomiting as the chief symptoms of strangulated hernia. It is common sense and practical knowledge of common things that we mainly want. I well recollect an anecdote, which was told to me when a boy, respecting a smart young farm-labourer in my father's employ. This young fellow had incurred the wrath of a half-witted young woman in the village, who, in revenge, said of him—"He can whistle fairly, and he can sing pretty well, but he can't plough straight."

This home-thrust so rankled in his breast that his accomplishments became annoyances to him, and he finally left the neighbourhood, unable to bear up under the frequent reminders as to what daft Meg had said. The distinction between the essential and the ornamental were here so strongly emphasised that, although the latter was not in the least depreciated, it stood as less than nothing in comparison with the former. So surely it ought to be with us. Respecting the essential, examiners might perhaps do well to leave nothing to chance, but, regardless of time, to make sure, so far as is possible, that the candidate possesses a really sound knowledge of them. It by no means follows that a candidate who knows what to do in traumatic gangrene is equally up to the mark in purulent ophthalmia; nor does a good knowledge of the latter imply ability to treat prostatic retention with success. Yet these are all equally essential, and they stand pretty much in the same relation to the duties of a surgeon as straight ploughing to a farm labourer.

We may reasonably hope that improved methods of instruction, and the application of common sense to our plans of teaching, will do away with the need for any material curtailment of the scope of study. The means provided for the education of students may be classed under three heads: teachers, books, and museums. Of the two former I do not propose to say much, but the last is an attractive topic which I cannot pass. The change which followed on the introduction of printing, in reference to the value of oral instruction, has often been the subject of comment. At the present time this change is complete, and no discoverer or propounder of new doctrines would ever think of bringing his observations before the public in any other way than by the aid of the printing press. He does not expect his hearers to come and listen to his professor's lecture, but he embodies his opinions in a book, and thus sends them broadcast over the world. If in the first instance, he read a paper or gives a lecture, it is that it may be printed afterwards. The professor of the present day is, for the most part, an exalted development of the tutor, and his duties are almost as much to ascertain that his pupils do really learn from books as to teach them from his chair. Few, indeed, are there who can attract hearers from outside their allotted classes. Nearly all have themselves published books, and their success, in nine cases out of ten, depends far more on their willingness to adapt themselves to the existing state of things as regards the students' requirements—to advise, supervise, and question them upon their abilities in the lines of original research. For the latter, the vocation is elsewhere. I am speaking, of course, of the professors and teachers in our colleges and schools of medicine. They have become the expositors of books, not of their own original and unwritten opinions. It is, I think, not improbable that another development is at hand, which will yet further diminish the importance of our chairs, and of oral instruction in general. I allude to the creation of students' museums. The museum, hitherto, has existed chiefly as an appendage to the chair. Our examining boards have required that teachers of anatomy, physiology, and pathology, should possess or create a museum of specimens from which to select illustrations for lectures. In many instances, these collections have not even been made accessible to students, and in none, until quite recently, has encouragement been given to the student to regard the museum as a place in which he ought to work. In one of our largest European capitals, possessing a flourishing medical school, there was, I believe, until very recently, and I am not sure that things are materially changed now, no museum which a student could enter without the most troublesome formalities. In several other continental cities possessing medical schools, the creation of a pathological collection, worthy the name of museum, is a matter of exceedingly recent date. I claim it as a distinguishing feature of our own country, one, however, which I willingly share with our Scandinavian relations, that our museums have for long been numerous and good, and I further assert that it is amongst the most valuable proofs of life in the scientific spirit which we can show that they are constantly growing and improving. In no country, however, have we as yet seen the full development of museums as means of medical education; and, if I

am not much mistaken, these institutions are destined in the future to assume an importance of which we have as yet scarcely dreamed. Well managed, it will be found that the museum may be made to combine the advantages of dissecting-room, ward, lecture-theatre, and book in one, and that it can supply permanently, at all times, and to all comers, opportunities, which are for the most part accessible elsewhere only at special times and to a privileged few. I do not mean that dissected preparations or models can ever supersede or rival work done *propria manu* with forceps and scalpel, but they may be made to assist it, to prepare for it, and to supplement it with most excellent results. Hitherto our museums, whether medical or in connection with general knowledge, have been far too miscellaneous. Huge crowded collections of material, some of it of the greatest value, and some of it of very little, have jostled together in a more or less orderly kind of confusion, through which only the well-constructed can find their way. They have been, by the majority, visited rather as places of wonderment, or perhaps of bewilderment, than for systematic instruction. Now museums ought to be as legible as books; and, when they are made so, they will be eagerly read. The very most that can be said of our very best, as yet, is that they have approached somewhat to the character of cyclopedias, from which fragmentary information upon all sorts of subjects may be obtained by those who know how to search for it. For students' purposes, something of a different kind is required—something much less voluminous, at once more concise and more consecutive: in fact, to pursue the comparison, more of the nature of a *handbook*. A students' museum should contain those things which a student wants, and those only. They should be well arranged, with plenty of space; and well labelled, not merely with a name, but a description. There should be nothing to distract attention, and everything to favour study. Anatomy should be illustrated by dissected preparations, casts, drawings, and diagrams; and these should be kept in juxtaposition; and from anatomy to pathological change the steps should be direct and clear. Side by side with the normal joint should be the diseased joint; with the specimens illustrating the precise position of the epiphyses, those showing their detachment by violence. No knowledge should be taken for granted in the learner, and as far as possible everything should be demonstrated. I must not go further into detail. Let me conclude what I have to say on this topic by the remark that we ought to have museums for educational purposes, distinct and wholly separate from those which are designed as magazines of facts deposited for the use of original investigators. The two objects are different; and not unfrequently that which is essential to the completeness of the one is useless and cumbersome to the other. In speaking of students, hitherto, I have been thinking of those who have not passed their examinations; but it is the boast of our profession that it possesses countless students of another grade, who have no longer the fear of the examiner before them, but who recognise the fact that even a lifetime is too short to acquire a fair familiarity with the facts of pathology, and who, however long their lives may be, will remain in the position of pupils. For these also—for these, perhaps, especially—museums ought to be provided; and here, again, I make bold to assert that nothing in the least adequate to the wants of the case has as yet been attempted. Our grandsons, if not our sons, will smile at the *dilettante* manner in which we have been content to hunt for the truth in matters of clinical research. We so often treat disease—at any rate, in its less common forms—as if it were sent merely that we should write papers about it, and discuss its nature in more or less detail, and with more or less seriousness, according to the humour of the hour. I do not speak now of the more practical section of the profession—men engaged in the daily and hourly discharge of arduous duties, in the conscientious endeavour to apply well-known rules to the treatment of disease, and only exceptionally concerned in the pursuit of new knowledge. I speak rather of the more ambitious amongst us—and, thank Heaven, they are now very numerous—men who attend societies, compile statistics, collect specimens, and write papers. Of these I assert—may I be permitted to claim for myself a humble position amongst them, and say of us?—that we are far too ready to yield to the temptation of thinking that disease was made for the physician, and not the physician for disease. We investigate it in the same spirit that an amateur geologist brings to his problems—as a thing which may agreeably exercise our ingenuity and train our minds, upon which we may perhaps

base our reputations, and out of which there may perhaps come some good for mankind. We claim to lay aside our work when we are tired of it, and to vote its too urgent pursuit a bore, forgetting that such investigations are to us a matter of the most urgent professional duty, and to our clients one of life and death.

That I may not seem to lose an unaimed shaft, I will take an example, and it shall be one in which almost the whole of the English profession to some extent is concerned. The museum of the Royal College of Surgeons, the Hunterian Collection, with its fifty years' additions, is without a rival in the world. It is a noble museum, and has been nobly cared for by a succession of curators who have made their names famous in science by work done within its walls. It may seem a bold thing to charge against an institution so foremost, that its arrangements are inadequate to the wants of the present day. Amongst the wants of the medical profession at the present time, and amongst those wants which alone a national museum is fitted to supply, is the fullest possible information respecting the symptoms of disease. It is not enough that we illustrate its final results, that we keep in bottles or otherwise the documents which demonstrate its ultimate conditions; we need [a pathology of the living as well as of the dead; and everything that human contrivance can do to elucidate this should be attempted. Here we must mark a huge hiatus in the arrangements of our College. There is little or no attempt to illustrate the effects of either disease or injury to the living, and an exceedingly meagre attempt to show what has been done in reference to instruments for surgical treatment. The modeller's art, of which such beautiful examples from Paris have recently been shown to us in the Congress Museum, is at our College "unknown and like esteemed." I must correct myself; for there, in a topmost gallery, a small collection of models, the gift of our present president. These, however, are only a little series selected from the magnificent array of similar objects to be seen in the St. Louis Museum at Paris. It is imperfect and ill shown, and the College makes no effort to add to it. A museum adapted to the wants of the practitioner should supplement the hospital, whenever possible, in the display of the outward characters of disease. Nothing in the whole range of diseases of the eye and skin or other external parts, nothing that a speculum can show, or a modeller delineate, should escape it; the common and rare should alike be there, and the practitioner should be able to resort to its galleries, when in doubt as to diagnosis, or desiring to recapitulate his knowledge, with confidence that he will there see all that can be shown. Nothing less than completeness should be the aim, and from all sources copies should be procured where the original cannot be had—the photographer, the modeller, and the artist being employed without regard to expense.

If a surgeon were now to go to our museum and ask to see models which would help him in the diagnosis of the different forms of chancre, or in the recognition of such sores on unusual parts of the body, I fear that he would be disappointed. He might find an unequalled collection of prehistoric skulls, and the skeleton of a splendid whale, but little or nothing in reference to the practical object of the diagnosis of surgical disease. Yet, in proof that it is possible to give such aid, I again appeal to the St. Louis collection.

Let it not be thought that I speak in disparagement of anthropology or comparative anatomy. It is a proud boast of our profession that its members have been foremost in these pursuits, and long may it be sustained. In their liberal cultivation, we follow the example of the founder of our museum, and keep up its most cherished traditions. But surgery has widened much since Hunter's time, and its special cultivation now asserts claims which did not then exist. And these claims are, I cannot but think, primary in such an institution; and, whatever it leaves undone, it should first attend to the duty of giving all that it can possibly give to the elucidation of human disease and the means of its relief. I cannot, however, believe that a liberal development in the new direction would necessitate any curtailment in the old. Let but a proper appeal be made to the profession, the public, and the Government, and means would surely be forthcoming which would enable our National Museum of Surgery so to develop itself, that no surgeon should ever spend a day in London without a visit to its collection, and none should pass through its rooms without obtaining information which would be of the utmost value to his patients.

There is yet another kind of museum which is, I think, a

desideratum, and which I have no doubt the future will possess; I refer to a museum-hospital, in which living persons, the subjects of chronic and incurable diseases of an unusual kind should be collected and encouraged to remain, with, of course, every attention to their comforts, for long periods; every facility being offered for their inspection by all members of the profession. From such hospitals I would wholly exclude common cases, such as are useful, nay essential, in the training of the student, and would collect only those likely to be instructive to advanced practitioners. Each case should be carefully studied by competent authorities, and described in an accessible catalogue. A visit to such an institution would be invaluable to the man engaged in busy general practice, and its growing records would become rich mines of information to the clinical investigator. Rare maladies are not to be regarded as mere objects of scientific curiosity, but should be utilised to the utmost, and made, if practicable, familiar to all; for in them often lies the key to the interpretation of other pathological phenomena which are common enough. Let us cease from dilettanteism, and try to economise our resources. When we do so, surely we shall find that there is a better way of dealing with examples of Myxœdema, of Addison's disease, of Charcot's joints, and Morphaeas, than by relegating them to the wards of an union asylum, where they will be seen by none. I mention these merely as examples; there are many others concerning which it is equally true that, if opportunities were afforded for their collection together, under conditions of facility for research and inspection, great help would be given both to medical education and to the progress of clinical knowledge.

I should be very sorry if what I have said, perhaps too plainly, as to what appear to me to be defects in our existing arrangements for the promotion of surgical knowledge, should have left the impression that I am in any degree a dissatisfied complainer. I hope that I yield to none in thankful appreciation of what has been accomplished in the past. But surely the fulness of the harvest which we have been permitted to reap, should prompt us to increased diligence in putting in seed for the next. We have every reason to feel encouraged and hopeful, but let us not allow the sentiment of confidence to lull us into sloth.

The chemist and empirical seeker after new drugs may, I suppose, share the pleasure which must come from the knowledge of how iodide of potassium has made curable a whole phalanx of maladies before hopeless, and not the less full of misery because often accompanied by the bitterness of self-reproach. The operating surgeon may remember the triumphs of ovariectomy, which has restored in health hundreds of mothers to their families. If we could bring together in one place those who, thanks to the ingenuity and industry of Von Gräfe, have been by iridectomy saved from blindness through glaucoma, and are now enjoying the blessing of sight, they would crowd this large hall, and leave no standing room. The abstruse optical researches of Young, Helmholtz, and Donders have borne fruit in the fact that thousands all over the world, whose sight was comparatively useless, now enjoy it in almost full perfection. The purely practical man may rejoice in remembering how much Sayre's jacket and Martin's bandages have done, and are daily doing, for the mitigation of suffering and the cure of diseases which render life a burden. The application of the germ theory to the treatment of wounds has, I doubt not, had for one of its results, amongst many others, that at the present moment there live, scattered in very distant places, many thousands of able bodied men, the fathers of families now earning their children's bread, who but for it would long ago have been in their graves. It is true that we as yet see no hope of a cure for cancer, but the pathological doctrine, which is rapidly gaining ground, that many forms are local, and that the pre-cancerous stage should be vigilantly recognised and vigorously treated, is already saving many from becoming its victims.

A few weeks ago, visiting a renowned cathedral, I found inscribed on its floor, at long distances apart, three remarkable words—*Credo, Spero, Amo*. I am not ignorant of the special meaning which, in such association, was meant to attach to these words, nor would I now, for one moment, attempt to employ them in a different sense if I thought it would give pain to the tenderest conscience in this room. But, indeed, they are words of the wisest bearing, and refer to feelings and attainments which lie at the very basis of all

human character. We become what we are, we effect what we do, in virtue of what we love, what we believe, and what we hope. I have ventured to censure as a weakness to which those who work in pursuit of a more intimate knowledge of disease are very liable—a spirit of dilettanteism, a willingness to be contented with half-results. For that weakness the cure rests in the *Amo*. He who intensely loves will sympathise with the miseries which afflict his fellow-men, and will be ever zealous for their relief. Nor will he fail to use every opportunity of becoming familiar with the reality of those miseries, and thus warm his sympathies and increase his love. Next comes the *Credo*. Do we heartily believe, in respect to the advancement of the happiness of man, in the value of the discovery of scientific truth? From the *Credo* to the *Spero*, in this instance, the step is very easy, for they are almost phases of the same sentiment.

I have just enumerated very briefly a very few of the countless encouragements to hope which those conversant with the history of our profession may easily find in the records of the last half-century. Can any doubt that they are but an earnest of far greater triumphs to come? The work that is before us spreads out in a sort of threefold division. We have to apply in the best practicable manner our present knowledge for the benefit of those around us. We have to do our best to increase that knowledge; and, thirdly, we have to find the best means for transferring it to the new generation which will soon succeed to our duties. Medical practice, the advancement of the knowledge of the nature of disease, and the training of our sons—such are our three great spheres of duty. Some of us work in one, some in another, most of us to some extent in all. Let us all seek to love the great final object at which we aim, to believe in the means which we are employing, and to hope confidently of their results.

Clinical Records.

ST. BARTHOLOMEW'S HOSPITAL.

Under the care of DR. MATTHEWS DUNCAN.

Reported by MR. SIDNEY DAVIES, B.A.

A Case of Carcinoma Uteri, relieved by Lead Iodide Ointment.

ELIZABETH M., æt. 62, was admitted into St. Bartholomew's Hospital on June 4th. Patient had been married forty years, and born six children, the last twenty-six years ago. She had also had four miscarriages. She stated that the catamenia had always been regular till twenty-five years ago, when they ceased permanently.

For two or three months previously she had complained of pains in the legs, and lower part of the back; these pains were worse at night, and kept her awake. She lost some blood sixteen months before admission, but not much. Since then there had been a light-coloured discharge. She lost a good deal eight months ago. She had had rather difficult labours, but otherwise had always enjoyed good health. Her mother died at 87, and she knew of no family history of carcinoma. She had no urinary or mental trouble.

The result of Dr. Duncan's examination was—Per hypogastrium, nothing abnormal discovered. Per vaginam, cervix uteri found to be enlarged, nodulated, and indurated. Bleeds when touched. Presents some ulceration.

Unguentum plumbi iodidi ordered to be applied frequently to the cervix. Tr. opii given at night to relieve the pain.

June 6th.—Urine, acid, 1010; trace of albumen from presence of vaginal discharge. Pulse 80; temp. sub-normal; slept better.

10th.—Patient has complained for two days of pain in abdomen, and vomiting. Temp. 102.3 last night. Pain of a colicky character. Abdomen resonant, natural. The unguentum temporarily discontinued.

14th.—Much better. Slight loss of blood from vagina. Eczematous eruption about the mouth.

16th.—Uterine pain diminished; sleeps better; troubled with flatulence. Unguentum applied again.

18th.—Feels better. Dr. Duncan found the cervix uteri less enlarged, and much softer.

July 2nd.—Complains of pain shooting down the legs, and in neighbourhood of hip-joint. The white discharge more the last two days; blood discharge less. Dr. Duncan.—Cervix is still lobulated, but is pale, and presents only a tender abraded surface in the middle.

5th.—Colicky pain very bad, especially after the application of the unguentum.

12th.—Dr. Duncan.—Cervix uteri still hard and lobulated, but reduced in size to nearly natural. Around the neck of the womb there is felt deeply irregular swelling.

15th.—Patient discharged relieved.

Remarks.—The interest of this case lies in the great improvement brought about by the ointment of lead iodide. This improvement was so marked that Dr. Duncan was, for some time, doubtful as to whether the case was not one of chronic inflammation resembling carcinoma; but when the ointment was discontinued for a few days, the patient always went back, and since her discharge she has again applied for admission, on account of incontinence of urine, and blood loss. Hence there seems no doubt that the diagnosis of carcinoma was correct.

The Mineral Waters of Europe.

THE "MEDICAL PRESS"

ANALYTICAL REPORTS ON THE PRINCIPAL BOTTLED WATERS.

By CHARLES C. R. TICHBORNE, LL.D., F.C.S., F.I.C.

President of the Pharmaceutical Society of Ireland, Lecturer on Chemistry, Carmichael College of Medicine, &c.

WITH

NOTES ON THEIR THERAPEUTICAL USES.

By PROSSER JAMES, M.D., M.R.C.P. Lond.,

Lecturer on Materia Medica and Therapeutics at the London Hospital, Physician to the Hospital for Diseases of the Throat, &c.

(Continued from page 162.)

Contrexeville.

THESE springs are situated a few leagues from Epinal, in the Voeges. It is used greatly as a medicinal water, but as it is rather indifferent we give the analysis here. The chief water sent out is the Source du Pavillion, the composition of which is as follows:—

Carbonate of calcium	18.30
Carbonate of magnesium	1.50
Carbonate of iron	0.52
Bicarbonate of lithia	0.30
Sulphate of calcium	87.78
Sulphate of sodium	17.78
Sulphate of magnesium	2.26
Chloride of sodium	0.30
Chloride of potassium	0.30
Silica	0.70
Fluorine, trace	
Arsenic, trace	

Total solids 130.74 gra.

Free carbonic acid not determined.

The fluorine is given on the authority of Debray, and is a peculiarity in this water. We had not enough water at our disposal to determine this point.

Skeleton analysis of $\frac{1}{2}$ -a-pint (10 ounces fluid)—

Total Solids.	Purgatives.	Salines.	Antacids.
8.1 grains.	.05 grains.	$1\frac{1}{2}$ grain.	$1\frac{1}{2}$ grains.

The amount of arsenic was not determined, but these waters of Contrexeville are said to give the following relative proportions in the deposit per 500 parts:—

Source du Pavillion	0.09
Source du Prine... ..	0.20
Source du Quai	0.15

The presumption therefore is that Sources du Prine and du Quai are richer in arsenic.

This water is pure and free from organic nitrogenous matter; with phenol-phtalien has a very slight action on boiling, and this is not of a permanent character. The antacid properties of this water, therefore, are mainly due to the alkaline earths. This water has a great medical reputation abroad, and would no doubt be of great value in the hands of the medical profession.

We have now concluded our list of table-waters. At the commencement of this section we pointed out the great difficulty which the classification of this group would present, but we have embraced in this group—1st. Waters which are generally used at the table, or have been proposed for that purpose; 2nd. Waters where the main ingredients are saline, with or without antacids, but invariably without any considerable quantity of those active purgatives, Epsom salts or Glauber's salts. Thirdly, we have not included any waters where the active ingredients much exceed 200 grains per gallon.

Necessarily a few arsenical waters appear in this group, and, taken in connection with the previous arsenical waters, may be said to complete the lists.

Brunsen, for instance, places Baden at the head of the list of arsenical waters. He says "there are few quantitative valuations of arsenic that can be relied on; I think I may quote the following as reliable":—

Burtscheid contains per litre	0.013 milligrammes.
Driburg " "	0.029 "
Weisbaden " "	0.038 "
Karlsbad " "	0.053 "
Soden " "	0.065 "
Kronthal " "	0.076 "
Baden " "	0.264 "

In the same paper he gives as reliable estimations of lithium a long list of water. We select out of them the most important:—

Aix la Chapelle (Liebig) per litre	0.19 milligrammes.
Ems (Struve)	1.50 "
Mariensbad Kreuzbrunner	
(Fresenius)	10.7 "
Baden (Brunsen)	54 "

The quantitative estimation of lithium is one of considerable difficulty when it occurs in small quantity, and although Brunsen in referring to the subject states that he has used a process which he considers in every respect reliable, he does not give it. The process adopted in these waters has been to separate by the ordinary analytical means the alkaline group, and then to convert the alkaline salts into sulphates and to treat these mixed sulphates with alcohol and to estimate the lithium; in

these residue after evaporating the alcoholic solution as phosphates.

Most of the weak chalybeate waters have been considered under the head of table waters, which are now concluded. We intend following these by a few of the strong iron waters which are of some importance, and thus finish the list of chalybeates.

THE RYDE MEETING OF THE BRITISH MEDICAL ASSOCIATION.

WHEN it was announced before the Cambridge meeting of the Association last year that the International Medical Congress would meet in London in the first week of August, 1881, it was seriously debated whether the annual meeting of the Association might not advantageously be for once omitted, it being reasonably anticipated that it could hardly prove either a numerical or a scientific success, following immediately upon the footsteps of the world-wide gathering in London. It was, however, said that an annual meeting of the Association was a necessary element under its constitution, and, as a warm invitation from the medical men of Ryde had been offered to the members, the majority of the Council thought that a satisfactory meeting at that place might be hoped for, calculating upon the probable longing of the foreign congressionists for a little fresh air and rural felicity as a relief from the labour and turmoil of the London assemblage; and so it was decided to hold the meeting at Ryde, and to follow the usual routine of addresses in medicine, surgery, and obstetrics, and of supplemental work in sections.

The meeting, which has just closed has been—as might have been expected—a feeble effort, notwithstanding the energy shown by the Isle of Wight practitioners in the attempt to make it a success. Scientific, gastronomic, and personal exhaustion was manifested on the part of the members who had come down from London to such an extent as to suggest the question, whether, after all, a *pro forma* business meeting of one day in London would not have served the purpose, and better maintained the credit of the Association. The names of members inscribed as attending the meeting exceeded 400; but when we say that, at the general meetings, the platform attendance did not usually exceed eight, and that the largest audiences seldom numbered more than 150, it will be understood that most of the 400 came for play and relaxation, and, for the nonce, preferred ruralizing to scientific business.

THE FIRST GENERAL MEETING

Was held on Tuesday, the attendance at which was very small, few of the members having yet come down from London. The Presidential chair having been vacated by Professor Humphry of Cambridge, and filled by the election of Mr. Barrow of Ryde, the financial report was read and its adoption resolved, not, however, without some protest by Dr. Hadden, of Manchester, who gave his reasons for not concurring in the opinion of the Council that the Association deserved congratulation upon its "earnest and effectual scientific work, public influence, journalistic efficiency, and material prosperity." Without expressing any opinion upon Dr. Hadden's views, we concur with him thus far, that such self-gratulations might as well be omitted from future reports.

SUPPRESSION OF CRITICISM.

We seize the opportunity, however, to object emphatically

to the method in which the decrees of the Council are rushed through the general meetings of the Association without any adequate opportunity for criticism. In this particular instance, the President, and the ex-Treasurer of the Association at once crushed out the animadversions of Dr. Hadden by laying down the law that no member had any right to move an amendment because the report could only be changed by the will of the Council, the power of the general meeting being thus restricted to rejecting it, as a whole, without reference to any one of its details.

We are not cognisant of any law of the Association which justifies such restriction of the right of criticism of the proceedings of the Council, but, if such law exists, we are strongly of opinion that, for the good of the Association and in the interest of liberty of speech, it should be at once modified, and that as long as it exists, the Council and officers of the Association would do well not to enforce it in such a way as to suppress a healthy and necessary discussion.

DISCOURAGEMENT OF DISCUSSION AT THE GENERAL MEETINGS.

The foregoing considerations lead us further to express our feeling that the facilities usually afforded for discussing the policy of the Association upon public questions are altogether inadequate, because of the prominence given in the annual programme to lengthened (and sometimes dreary) addresses on medicine, on surgery, and on collateral scientific subjects. We are not to be understood as depreciating the value of a cleverly executed yearly *rechauffe* of the progress of our art in its various departments, but we do say that, to devote a daily hour and half of the valuable time of the Association to disquisitions, which can be appreciated and digested much more thoroughly in print a few days afterwards, is a cardinal error of system, all the more serious when it has the effect of preventing the interchange of the opinions of members upon public subjects of pressing importance.

The business of the Ryde meeting forcibly illustrates this statement. For example, the discussion on a most important report of the "Collective Investigation Committee," which proposed the establishment of an entirely new and extensive department of the Association and the appointment of salaried officers, was altogether "burked" by want of time. The recommendations of the Committee could neither be debated nor adjourned, because the way was blocked by the addresses which had to be delivered. Accordingly, the report was adopted without discussion. The same occurrence took place, when the subject of notification of infective disease was under criticism, a hasty vote being snatched, in order that the address in surgery might be proceeded with, and *mutatis mutandis*, the same observation would apply to resolutions on vivisection and on calf-vaccination which, we believe, would have been fully discussed had time permitted. We are distinctly of opinion that the incapacity of the meetings to deal with these subjects, the importance of which is immediate and urgent, was not atoned for by any, or all of the addresses given at Ryde, and we put it to the common sense of the Council to take steps to provide against the future sacrifice of pressing business to facilitate the reading of long-winded dissertations on abstract subjects. If a remedy for the existing method of doing business cannot be found, we submit that it is altogether useless and disappointing that the work of the Council, and the various central committees, should be submitted for approval to the general meetings.

THE SECOND DAY.

The business of the Association commenced with the resignation of the Presidency of the Council by Dr. Carpenter, of Croydon, and the appointment of Dr. Wheelhouse, of Leeds, in his stead. Dr. Carpenter's work for the Association has been a labour of love for him, and of great value for the entire organisation; and the compliments paid him on his retirement were fully deserved.

THE PLACE OF NEXT MEETING.

It was then announced that, inasmuch as the year 1882 would be the fiftieth anniversary of the establishment by Sir Charles Hastings of the Provincial Medical and Surgical Association, which afterwards became the British Medical Association, the meeting for that year would be held at Worcester—the parent-city of the organisation—Dr. Strange, of that city, being nominated as its President. Invitations had also been received from the medical men of Liverpool and of Glasgow; and it was stated that the meetings for 1883 and 1884 would probably be held in those towns. This business having been transacted, the remainder of the meeting was devoted to

DR. BRISTOWE'S ADDRESS IN MEDICINE.

The learned lecturer, having selected Homœopathy as his theme, may be judged to have intentionally chosen an agitating subject, and certainly if his purpose had been to create a sensation and invite criticism he was fully successful. It seems to us a grave question whether it is wise or in good taste that the public orations of the Association should be used for the pronouncement of opinions upon disputed questions, which opinions may be regarded as those of the profession, not of the lecturer, and respecting which the audience are not permitted to say a word. We do think that in this particular instance the choice of a subject has been particularly unhappy, and that the method of discussing it by Dr. Bristowe ought to be considered by the Council, with a view, if necessary, to a public repudiation of the lecturer's views. The oration itself was strangely illogical, the greater part of it being devoted to an *exposé* of the monstrous fallacy and probable dishonesty of homœopathic practice, while the peroration consisted of an entreaty to his hearers to take homœopaths to their embrace as consultants on even terms and as professional *confrères*.

Thus, in the early part of his address, having minutely reviewed Hahnemann's theories and practice—having pointed out *seriatim* the obvious falsity of one and the disastrous results of the other—the lecturer wound up this section of his discourse in the following words:—

"How curious, how ingenious, how interesting the whole thing is! How excellent, if true! And has it not the simplicity of truth in it? The entire range of diseases, the entire range of therapeutics, converted into Chinese puzzles; the phenomena of diseases and the effect of drugs upon them treated as algebraical equations! *It is impossible to conceive of any physician working daily by the bedside of patients, and in the dead-house, and seeing diseases as they are, framing such a system, except as a joke.* It could only have been, as in fact it was, the serious work of a visionary who had thrown off the trammels of fact, and, allowing his imagination to run riot, mistook its fantastic figments for a revelation from heaven."

Having described Hahnemannism in these terms, Dr. Bristowe devoted himself to showing that the present practitioners of homœopathy could not be reasonably conceived to have belief in that which they practise. He said:—

"It is hardly possible that every homœopath should believe fully in the efficacy of the infinitely little doses which Hahnemann contended were the most efficacious, or should believe in the potential effects of the

shakings of his preparations, to which, in fact, he largely attributed the development of curative energy in them; hence the dosage with some is much larger than Hahnemann would have sanctioned. Nor again, was it to be expected that every thinking man would admit that remedies cured diseases because they produced identical effects with them (and, indeed, unless one assumes that remedies act like Pharaoh's lean kine, and then die of a surfeit, it is difficult, to say the least, to imagine Hahnemann's process of cure in progress)? and hence has arisen an hypothesis with respect to the influence of minute doses in the cure of diseases, which is fully as ingenious as Hahnemann's own, and is probably just as true, but which has the theoretical disadvantage for homœopaths of converting homœopathy into antipathy! I shall not stop to consider the propriety or plausibility of these and other like innovations in orthodox homœopathy; and I leave those who advocate them to reconcile them as best they may with the teachings of their founder. To me, I confess, they seem in direct contravention of homœopathic principles, and fraught with ultimate disaster to the homœopathic cause."

Lastly, he asks:

"If these men are honest and educated, and at the same time duly qualified practitioners in medicine, how can they believe, and how can they practise, such a palpable imposture as homœopathy?"

And he answers his own question by the simple statement that—

"It is difficult to account for the beliefs and vagaries of the human intellect."

The foregoing quotations from this remarkable speech should surely be sufficient to make it clear that Dr. Bristowe abhors and repudiates homœopathy in all its aspects, and conceives utterly impossible a beneficial interchange of ideas between a scientific physician and one who either follows, or lets it be believed that he follows, the teachings of Hahnemann. But the outcome of Dr. Bristowe's chain of reasoning is simply astounding. He spoke as follows:—

"I shall not discuss the question whether we can, with propriety or with benefit to our patients, meet homœopaths in consultation. *I could, however, I think, adduce strong reasons in favour of the morality of acting thus, and for the belief that good to the patient would generally ensue under such circumstances.* I shall not consider at length whether the dignity of the profession would be compromised by habitual dealing with homœopaths. But I may observe that it is more conducive to the maintenance of true dignity to treat with respect and consideration, and as if they were honest, those whose opinions differ from ours, than to make broad our phylacteries and enlarge the borders of our garments, and wrap ourselves up, in regard to them, in Pharisaic pride."

A public pronouncement of this sort may be creditable to Dr. Bristowe's logical ingenuity, but it is certainly discreditable to the Association, and distasteful to the profession; and we thank Dr. Long Fox and Mr. Stokes, of Dublin, for having uttered a repudiation of such doctrine.

The lecturer has altogether misconceived the reasons which actuate the profession in refusing to meet homœopaths. Many of us, probably, do not believe them honest practitioners or honourable men; but even those who charitably assume them to be so, should in all reason decline to interchange medical ideas with them, because there can be no salutary interchange where absolute hopeless incompatibility of principle exists. The scientific physician may be right in the principles which guide his practice, but, if so, his advice is pernicious nonsense in the ears of a homœopath, and the reverse proposition to this is equally true. The patient cannot benefit, but must suffer from a muddling-up of theories, one or other of which is absolutely false. Therefore, wholesome association between practitioners of the opposite schools is impossible, and no one has

ever more conclusively proved that it is so than Dr. Bristowe, the Lecturer on Medicine of the British Medical Association.

It is our duty to say that his homily to the profession on the exercise of charity is uncalled for; that his advice will not be accepted; that his opinions are his own and not those either of the British Medical Association or of the medical profession; and that his speech, inasmuch as it will certainly be utilised by homœopaths as a formal recantation of our scientific dogmas, was indiscreet and most injurious to the prestige of scientific medicine.

It seems to us that the hour has come for the members of the British Medical Association to put down their foot upon the obvious disposition of certain influential people within its ranks to coquette with homœopathy. There are palpable signs of a movement to level homœopathy up to medicine and medicine down to homœopathy. There is but one honest way of completing that process, and that is by the homœopath publicly disavowing those views and practices which he has already—in many instances—disavowed secretly. When he thus shows himself honest in action he can be received, and not until then, for, as long as he seeks public patronage on the ground of homœopathy, he cannot honourably put that schism aside and resort to the system of scientific medicine, either to meet the views of an allopathic consultant or even to cure his patient. If homœopaths are no longer Hahnemannians—as Dr. Bristowe suggests—let them honestly say so. They are certainly not fit associates as long as they sail under false colours, even though they fight under the flag of allopathy.

The afternoon of the second day's meeting was occupied with an excursion of the members to Brading, to see the remains of a Roman villa. A special train carried the visitors there and back, and it was crowded. The visible remains of the villa consisted in two tessellated pavements, in a fair state of preservation, respecting which, however, no description was forthcoming.

The afternoon closed with the annual

DINNER OF THE IRISH GRADUATES' ASSOCIATION,

which took place at the Esplanade Hotel, under the presidency of Dr. Banks, physician to the Queen in Ireland, and under the energetic management of Dr. Thompson of Leamington, secretary to the Association. A special and most commendable feature of this *reunion* is the admission of ladies to it, the success of which arrangement suggests to those in authority the propriety of, as far as is possible, providing for the recreation and amusement of the wives and daughters of members attending the meeting. It is a question worth considering whether the interest in the annual dinner of the British Medical Association might not be enhanced, and its success (always a little doubtful) assured, by admitting ladies to it at a lower tariff than that required from members. The Irish Graduates' Association has shown a good example in this direction.

THE MAYOR'S SOIREE.

In the evening the Mayor and Corporation of the borough opened the Town Hall to the Association for a *soirée* which was numerously attended and, in all respects, successful. An excellent band and some pleasing vocal music were provided for the amusement of the visitors, and, as the size of the room obviated any unpleasant crowding, the evening was very enjoyable.

THE THIRD DAY (THURSDAY)

was opened by the breakfast usually given by the National Temperance Association at the Royal Victoria Rooms. The meeting was under the especial management of Dr. Norman

Kerr who has been called upon to assume the duty hitherto discharged by Dr. Stephen Alford, who unhappily lost his life by railway accident a few weeks ago. The breakfast was all that could be desired, but, if we may offer a suggestion, we think it would be well that the succeeding speeches should be devoted rather to eliciting medical views on temperance questions than to addresses of welcome and hopes for professional co-operation. There is no more deserving movement within our profession than the application of temperance principles to our practice, and we think that much benefit would result from a free discussion of this subject either at these breakfasts or elsewhere. Though warmly invited to do so, individual guests are naturally unwilling to obtrude their views on such an occasion, but we think that, if short provocative speeches were organised beforehand, the object we desire would be effected.

The Third General meeting of the Association was devoted to the Report of the Parliamentary Bills Committee, the salient point of which was the

NOTIFICATION OF INFECTIOUS DISEASE.

The Report stated, *inter alia*, that it was the intention of the Committee to introduce a Bill next session to provide for such notification, and Mr. Michael, Q.C., well known as the advocate of the proposal—that the physician should be compelled to notify to the sanitary authority under penalty,—which proposition was embodied in Mr. Gray's Bill for Ireland of the present Session, and in Mr. Hasting's Bill now before the House of Commons, came down from London for the purpose of securing the adherence of the members to his views. Mr. Michael availed himself of the opportunity of this meeting, to impress his views on the assembled members, and he did so with much ability, and at much length. He moved a resolution to the effect that the Parliamentary Bills Committee should be instructed to give their support to Mr. Hasting's Bill, which is promoted by the Social Science Association, but his arguments did not carry conviction to his hearers, for, after an earnest debate, initiated by Dr. Fitzpatrick, of Liverpool, and followed up by Dr. Jacob, of Dublin, and others, the resolution was negated by a large majority. The question of the adoption of the Report was then put, and the clause which pledged the Committee to promote a Notification Bill, was warmly resisted. Dr. Sibley, on behalf of the Committee, stated that they contemplated only a measure under which the physician "may" notify the occurrence of infective disease, and, as the President would not allow any further discussion, a hurried vote was taken, approving of the Report of the Committee.

It was, however, manifest to all present that, if the subject could be sufficiently debated, and the proposal of the Committee sufficiently understood, the majority of those present would have been against the promotion of the contemplated Bill. The purpose of that Bill was not understood. It was not realised that, under the physician *will be forced* by a £5 penalty, to serve upon the patient's custodian a written notice of the nature of the disease, a proposal altogether different from that pictured by Dr. Sibley.

We hope that the speeches made on this occasion—though the discussion was hurried and unsatisfactory—will cause the Committee to understand that, in the interest of the profession, any such legislative proposal must be opposed, and that no law should be allowed to pass which fixes, directly or indirectly, the notification responsibility on any one save the custodian of the patient.

The Address in Surgery was then delivered by Mr. Jonathan Hutchinson, and was heard with much interest. It will be found on page 161.

THE PUBLIC DINNER.

The evening was occupied by the Public Dinner of the Association, of which it is kind to be silent. The difficulties of the local executive in a small town like Ryde to provide a dinner for a large body of gentlemen may be easily understood. Those difficulties are greatly increased by the inconsiderate omission of many members to enter their names on the dinner-list until the eleventh hour, and, in this instance, the result was a regrettable failure of the entertainment. We venture to suggest that a similar fiasco might in future be obviated by charging a less price—say 15s.—for the dinner cheque of those who gave in their names on or before the first day of the meeting, and by rigidly exacting £1 1s. 0d. from those who delayed their entry until the last moment.

THE FOURTH DAY (FRIDAY)

Was occupied in the forenoon by the address of Dr. Sinclair Coghill, on "The Progress of Obstetrics." The communication was admirably thought out and expressed, and the matter contained in it was of much value, but, as a whole, it was greatly too long, and much of it had to be sacrificed for the sake of brevity. Compression is as useful a treatment for public addresses as for aneurisms, and that quality would be best achieved by the rehearsal of an address before its delivery.

In the afternoon of the same day the President and Mrs. Barrow received the members and the ladies with them in the grounds of the College at a garden party, the pleasing anticipations of which were defeated by the weather, which turned out most inclement.

We cannot pass from the record of this meeting without offering our testimony to the earnest activity and hearty hospitality shown by the medical men of Ryde. Everything which an enthusiastic desire to do justice to the occasion and credit to themselves could do was done by them, and if the result was only mediocre, the mediocrity is in no way chargeable against them.

THE SECTIONAL WORK

Of the meeting was fairly good, considering the supersaturation of the members with professional science at the recent meeting of the International Congress.

We have already noticed the work done in the Public Health Section.

OTOLOGY.

The Sub-section of Otolology was opened on Wednesday, Aug. 10th, with an address from the Chairman, Dr. Wilson Pritchard, on "Aural Surgery as a Branch of General Medical Education." The chairman referred to the general ignorance of the diseases of the ear and their treatment among students and practitioners, and attributed this mainly to two causes—(1) a profound contempt for aural surgery; (2)—of which this contempt is a natural outcome—a want of knowledge of what aural surgery can do for ear diseases. At the conclusion of the address Dr. Pritchard urged that something might be done to prevail upon the examining bodies to include aural surgery in the subjects in which students might expect to be examined, and suggested that a committee might be appointed to consider the best means of attaining this end.

Discussion on the address being invited, some remarks were made by Dr. Löwenberg (Paris), Mr. Cresswell Barber, Dr. Jacob, Dr. Barr, and others.

The sub-section then proceeded to the discussion of the first of the two subjects selected, viz., "The Relation of

Diseases of the Nasal Passages and Naso-Pharynx to Aural Affections." This was opened by Dr. Barr (Glasgow), who referred to the important relations of naso-pharyngeal disease to the ear, and mentioned the various forms of naso-pharyngeal affections which affect the auditory organ, especially vegetations and adenoid growths. On this point the discussion mainly turned, being continued by Dr. Guye (Amsterdam), Dr. Löwenberg (Paris), Dr. Reeve (Toronto), Mr. Douglas Hemming, Mr. Cresswell Barber, and the chairman. There was a general agreement as to the very important part which affections of the naso-pharynx play in the causation of ear disease, and there can be little doubt that, as these regions are more systematically investigated, many more cases of ear disease will find relief.

On Thursday resolutions were passed by the sub-section to the effect that it was desirable that a committee should be appointed to consider the best means of promoting the study of aural surgery, especially in regard to examination in the subject, and that the said committee should consist of the Chairman and Secretaries of the sub-section, and (with their consent) of the teachers of otology in the United Kingdom.

The second subject for discussion—"The Treatment of Acute Suppurative Inflammation of the Middle Ear, with especial reference to Perforation of the Mastoid." In connection with this subject, Dr. Barr read a paper on "The Treatment of Purulent Discharge from the Ear, where the Source of the Secretion is in the Upper Part of the Tympanum and the Antrum Mastoideum; with Four Cases." The discussion which followed showed a considerable consensus of opinion in favour of the use of boracic acid in purulent otitis. Dr. Jones (Chicago) also employed cotton impregnated with iodine. Dr. Löwenberg also used alcohol. Dr. George and Mr. Hemming spoke especially with reference to the question of perforation of the mastoid, the latter referring to Dr. Hotz's paper in the "Archives of Otolology," No. 2, 1880. Dr. George considered he had saved life by the operation. When Wilde's incision only is used great care must be taken to keep it open. Mr. Hemming had found the cotton wool medicated with iodoform, boracic acid, &c., as introduced by Dr. Woakes, very useful in purulent discharge. The Chairman often combined thymol with alcohol in these cases. As to perforation of the mastoid, where there is pus present in the cells we must trephine.

Several instruments and appliances were then exhibited—an ear-protector against noise, shock of cold, sea-water, &c., by Dr. Ward Cousins; Politzer's small hearing tubes; a self-retaining nasal speculum, and an improved form of aural scoop, by Mr. Cresswell Barber; a modification of Brunton's speculum; instruments for use with the Eustachian catheter, for forcing water and medicated fluids through, by Dr. Jones (Chicago); a combination of Brunton's otoscope and Siegle's speculum, by Mr. Hodgson (Brighton).

The sub-section closed with the usual votes of thanks to Chairman and Hon. Secs.

DR. BUDDS, dispensary medical officer, Cork, died suddenly last week. Dr. Budds came to Cork some years ago from Dublin, and was appointed house surgeon of the South Infirmary. He afterwards was appointed to a dispensary district in the city, and held the honorary post of physician at the North Fever Hospital.

THE ETHICS OF SPECIALISM.

In his address to the members of the British Medical Association recently, Mr. Jonathan Hutchinson opened up a subject of the utmost importance to medical men, and of the utmost importance, too, to the general public. It is a subject on which in the past we have dwelt with a freedom of language that has secured for us a good deal of unpleasantness and annoyance from interested persons; and it is one, moreover, on which we have as yet by no means said our say. Special hospitals have in the past been the means of perpetrating many gross irregularities, and in the present time there are many of these institutions that exist solely for the benefit of those who make them a bait for the unwary. It is the misfortune of specialism in its best and highest sense to be inseparably associated in the minds of the inexperienced with the abuses committed at special hospitals of a certain kind; and every exposure endured by the latter is taken as a blow to the principle they so improperly represent. Specialism, when pursued in the narrow spirit of rigid exclusion, cannot result in anything but the miserable failure of the specialist; his unfitness for the rôle he adopts is demonstrated in the weakness of his pretensions, and the best evidence that specialism means nothing so little as following a single line to the utter

neglect of everything that lies outside of and beyond it, is afforded by the acknowledged specialists of our own time—men whose breadth of knowledge and extent to which they can employ it fits them to be leaders in many branches that modesty alone prevents them from shining in. This fact properly appreciated contains the key to the whole question of specialism; and it indicates that the specialist needs to be an educated medical man within the full meaning of that comprehensive term, and then the follower of a particular line of practice. Mr. Hutchinson's eloquent exposition of the claims exerted by ophthalmic surgery are capable of being turned to prove this proposition; both he and everyone who thinks with him would demand that the first condition towards successful special practice is, indeed, an adequate general education in the science and practice of medicine and surgery. It might, indeed, seem almost unnecessary to urge so elementary a truth, but the utterances that have so lately rung in our ears do emphasise the conviction gained on reviewing the position of many institutions in this country, a position which irresistibly tends to show the utter neglect of the truth above enforced by those who have created and supported them. As Mr. Hutchinson has urged, “Let the profession set its face, not against specialism as a whole, but rather against those institutions which are conducted in a narrow spirit.” He might have gone further than he did when he insisted on open elections of officers and demanded the speedy and efficient clearance of the boards of many an improperly named establishment, an entire re-fitting, and the introduction of a purer element of worth where all has hitherto been prostituted to the furtherance of private ends.

The opponents of specialism are a class of whom, it may be broadly inferred, that they are deficient in that power which enables a man to see how ignorant he needs must be. Whoever continues to suppose that he need not, for his patient's good, if not for his own, to invoke the aid of an ophthalmic surgeon in cases of eye disease, of an aurist for the cure of a rebellious ear complaint, the assistance of a specialist in the diagnosis of an obscure cerebral tumour, and so on, is one with whom it is impossible to argue concerning the impossibility of universal proficiency, for the reason that he has no inkling of what proficiency implies, and that there are, unfortunately, many members of the medical profession who occupy this position, is only too plain. Few of us do not almost frequently come across some such representative of ignorance; and it is, by no means, a sweeping assertion, that they are to be found far more frequently in positions of importance connected with special hospitals, than they are to be seen in general institutions. This it is that deals most harm to legitimate specialism: it is the ministers that damn the creed; and well would it be for the scientific advance of this country, that the whole administration of hospital charity became the work of an irresponsible central bureau. The damage is being done by the narrow, illiberal action deplored by Mr. Hutchinson in his Ryde address; until we can obtain the freedom and openness that he desiderates, we shall see no improvement on the present system, and the few deserving special hospitals will be classed by the indiscriminating

with the many bastard ones. On one point touched on, in the same address, there will be various opinions expressed, that, viz., of adding special departments to general hospitals. In certain circumstances this might be, and is, attended with satisfactory results; but in others again, it cannot be regarded as producing unexampled benefit. There is much to be said in favour of associating in a large institution the multitudinous forms of disease, so that where room and means of treatment are at hand, it is possibly to be desired. But in those, by no means rare, cases where makeshift does for what is necessary, and skilled attention is not forthcoming, then the experiment can result only in disaster. And again the percentage of special cases can never be a large one at any one time, or in any one locality, so that unless drawn from the immense numbers who flock to a huge institution, they must ever be insufficient to justify a separate maintenance. On the other hand, when a particular institution is assigned to them, they will proceed to it direct, and hence, too, arises a further necessity for the presence of the best available means of treatment.

The whole subject, however, of specialism, both in connection with hospital and with private practice, is one that requires, and must receive, thorough ventilation, and it cannot come too soon.

Notes on Current Topics.

Death of Mr. Luke.

THE well-known octogenarian surgeon, Mr. James Luke, died at his residence, near High Wycombe, on Monday last. For some years Mr. Luke had been a consulting surgeon to the London Hospital, his connection with that institution dating from 1823, when he became Lecturer on Anatomy to the hospital. He obtained the Fellowship of the Royal College of Surgeons of England in 1843, and was elected a member of the Council of that body three years later. In 1851 he was a member of the Court of Examiners, and served the office of president of the college in the years 1853 and 1862, having been Hunterian orator in 1852. His service to science procured him, in 1853, the Fellowship of the Royal Society, and for a period of ten years after the latter date he continued in his large practice, finally retiring from active service as surgeon to the London Hospital in 1863. Of late years Mr. Luke has naturally been seen but rarely by those who are, notwithstanding, familiar with his name, and many will regret the loss produced by his death. Mr. Luke was one of the links which bound the old school to the new, and he was, moreover, almost the last remaining. At one time he exerted a strong and important influence on the progress of surgical science in this country, and the record of his life is an example of determined and successful endeavour.

Street Comforts.

WE are not surprised that the introduction into London of new, comfortable, and commodious carriages, on the routes along which the unsightly, miserable buses of the London General Omnibus Company travel, has excited

the greedy fears of this would-be monopolist association. The ill-advised demand made by the existing bus and cab proprietors for Government protection, against probable loss to themselves from the successful plying of the new conveyances, will excite in the public only indignation against the petitioners. The evil daily done to public health by the disease-fostering machines, in which the travelling sections of society are compelled to do their journeyings in the streets of London, is incalculable; and the time has long enough arrived when the change rendered so necessary should be initiated in the direction of reform in the construction of hackney carriages of all descriptions. The Omnibus Company have persistently refused to cater for the comfort of the numbers out of whose pockets it has so long drawn enormous dividends, and now the task is being done independently of it, it commences to protest against the infringement of its rights. We trust the energetic proprietor of the new and comfortable conveyances, both those of the great railway companies, and those run by other owners, will meet with an amount of patronage that may demonstrate to the older company the unwisdom of the policy so long pursued by it. That ventilated omnibuses, built to run smoothly, and arranged with some view to the convenience of passengers, will always receive the preference of travellers there cannot be any doubt. We trust they may rapidly crowd out of the streets the miserable makeshifts that look, beside them, like relics of a barbarous past.

Donations to Hospitals.

MRS. ELIZABETH LETHEY has left a sum of £1,000 to form a scholarship or prize, to be awarded annually to the student, in the medical school of the London Hospital, who shows himself most proficient in chemistry. Such scholarship is to be known as the "Dr. Letheby Prize," in memory of her husband, who was for many years Professor of Chemistry at the London Hospital.

The Birmingham General Hospital will by-and-by benefit to the amount of £50,000 by the will of the late Mr. A. S. Wilkes, who recently committed suicide while suffering from mental depression. The deceased bequeaths the whole of his estate, which is valued at £100,000, to the Birmingham and Midland Institute and the Birmingham General Hospital, on the decease of his sisters, who are to hold it in trust during their lifetime. This munificent donation, acquired under such melancholy circumstances, will serve to place the Birmingham Hospital among the most richly endowed of provincial charities, and it is eminently deserving of the position it must by-and-by occupy.

Sir Sydney Waterlow, the treasurer of St. Bartholomew's Hospital, has received from Mr. Charles Kettlewell, of Armadale Castle, Island of Skye, a governor of the Hospital, a communication offering the sum of £10,000 for the erection of a convalescent home for St. Bartholomew's Hospital, as a memorial to his late brother, who died of fever in Naples. The offer is conditional upon a suitable site being found within a reasonable time.

THE fifth annual meeting of the American Dermatological Association will be held in Newport, R.I., on August 30th and 31st, and September 1st.

The Public Health.

THE Registrar-General Reports that during the quarter ending June last, there were 162,324 deaths in the United Kingdom, and 293,024 births. In England the births numbered 225,467, a smaller number by 7,039 than were registered in the corresponding quarter of 1880. The deaths in England and Wales amounted to 120,825, thus giving a rate of 18.6 per 1,000. This rate is an exceedingly low one, being 2.3 below the average for the ten preceding corresponding quarters. The excess of mortality in the urban compared with the rural population was considerably below the average. In twenty of the largest English towns, including London, and having an estimated population of about seven and a-half millions of persons, the death-rate averaged only 20.5 per 1,000, corresponding with that which prevailed in the second quarter of last year; in the corresponding periods of 1878 and 1879 the death-rate in these towns averaged 22.7 and 22.3. The lowest rates in the twenty towns last quarter were 16.6 in Brighton, 18.1 in Hull, and 18.3 in Plymouth; the rates ranged upwards in the other towns to 22.4 in Sheffield, 23.3 in Manchester, and 24.3 in Liverpool. The high rates in Sheffield and Liverpool were to a considerable extent due to zymotic fatality, while the high rate in Manchester cannot be attributed to the same cause. In fifty other English and Welsh town districts, having an estimated aggregate population of rather less than three millions, the death-rate averaged only 18.8, and was 1.7 below the mean rate in the twenty larger towns. Among these fifty towns the death-rate did not exceed 13.2 in Maidstone, 13.6 in Dover, and 13.7 in Cheltenham; the highest rates were 22.8 in Blackburn, 23.3 in Macclesfield, 23.7 in Stockport and Ashton-under-Lyne, and 24.8 in Merthyr Tydfil. The high zymotic death-rate in great measure accounted for the excessive mortality in Macclesfield and Merthyr Tydfil; whooping-cough was fatally prevalent in the former and scarlet fever in the latter of these towns.

The Health of Bengal, 1880.

THE Report for 1880 of the Sanitary Commissioner for Bengal has recently been published. According to that Report a considerable improvement as regards the general health of the province took place. The number of deaths by cholera also underwent a decrease from 136,363 to 29,643 in 1880. In 118 registration circles of the province no cholera appeared, against 30 in 1879; the disease only visited 19 epidemically, against 87 in 1879; 45 severely, against 98. This happy state of things is looked upon as being in a great measure due to the fact that an unusually heavy rainfall took place throughout the three first quarters of the year. If this be so, the Report contains the record that as a result of these conditions the registered deaths by fever rose from 622,260 in 1879 to 689,605, numbers, it is stated, probably far below the truth. Reduced to figures then, we learn that in 1880 a decrease in the mortality by cholera equal to 96,720 took place. On the other hand, there was a rise of 67,345 in that by fever as compared with that of 1879, the actual decrease by these combined death causes being 28,375. When, however, the circumstance is stated that the ratio of difference between 15.85 in 1879 and 15.40 in

1880, namely, 0.45 per 1,000 of population, represents the entire saving of life in the latter as compared with the former, the fact presents itself that fever was but one among diseases by which in reality the entire mortality was kept up to a mere fraction of what it had been with cholera—in other words, that the relative decrease in cholera had very slight influence on the general rate of mortality for the year.

The prevalence of fever on this occasion is assigned partly to the obstructed drainage and partly to the filthy condition of the water tanks in the affected districts. But in both these respects the conditions are, as far as can be ascertained, much in the same state as they were in previous years, in some of which cholera was very prevalent, in others when that disease as well as fever were less so than in 1880. It is evident therefore that the actual causes of both these affections are to be sought for beyond the mere circumstances that drainage was imperfect and the quality of the water inferior.

International Dosimetry at the recent International Pharmaceutical Congress.

THE chief pharmaceutical event of the month has been the holding of the fifth International Pharmaceutical Congress in London. Delegates from all parts of the world attended this Congress, which has been by far the most successful of any of the series. Thus, an International Pharmacopoeial Commission was formed, authorised to draft a scheme for submission to the next Congress at Brussels, three years hence, to equalise the strength of potent medicines in all national Pharmacopoeias. The Pharmacological Section of the International Medical Congress has agreed to the appointment of a Commission of medical men to work with the pharmacists in this object. The International Pharmacopoeial Commission appointed by the Congress met and elected Mr. A. von Waldheim, of Vienna, as president, and Dr. Goddefroi as secretary of the Commission. They will draw up a preliminary scheme, and, after obtaining the criticisms and suggestions of the other members of the Commission, will prepare a formal draft of the proposed international formulary for submission to the next Congress at Brussels.

The Madras Medical School.

THE distribution of prizes to pupils in the Madras Medical College took place not very long ago, on which occasion a learned professor in that institution expressed, at considerable length, his views on things medical and others; but in a manner which apparently met not altogether with the approval of the chairman of the meeting. The *Madras Times* of July 1st, 1881, contains a very full report of the address alluded to, but for the benefit of the readers of the *Medical Press and Circular* a few of the more exquisite gems of the oration may be picked out, and left for setting, thus:—

“In this enlightened assembly there must be some who consider the subordination of woman an inevitable law of nature. All must agree in this—that the enforced idleness of many women is a great defect in our social system. Women are too frequently a trial to themselves and a burthen to others. Many are the lives, incalculable the potential energy thus wasted and lost. But matters are

mending. There are many who doubt the necessity for, or propriety (for shame!) of, female medical practitioners. In India there is a field for medical ladies; a medical zenana mission would be esteemed were it free from suspicion of religious proselytism. Religion should have no need to shine by borrowed light; let us have purely medical missionaries. In Dublin, where the mortality, as compared to other cities in the United Kingdom, is as that of Madras to other cities of India, a Ladies' Sanitary Association has lately been established. Let them institute a crusade against the follies of fashion—some of these no less barbarous than the deforming practices of limping Celestials, or tattooed savages. Mahomedans witness our developments of chemistry, mechanics, optics, electricity, yet are slow in giving credit for our advances in the science of medicine. With the exception of a few incorrigible classical pedants, there are few men who do not believe that classical education has been overdone, to the detriment of modern literary and scientific culture. The scientific pedant is not very common. In him one drop of knowledge so intoxicates his reason that he becomes oblivious of the boundless ocean before him. To the natural philosopher the grand interpretations of universal law are more noble than the conceptions of any fetish worshipper. It is the herculean mission of modern science to overthrow the strongholds of bigotry and ignorance. Disease is always more or less preventible. Hygiene may do much to promote longevity, morality, and happiness; it may also lessen the heritage of disease to generations yet unborn. Our breed of horses and of other animals are the results of selection and education for many generations. Similar care would produce equally valuable results in the improvement in mankind."

Then follow some remarks addressed especially to the students, but the examples already given may, perhaps, be deemed enough.

False Assumption of Medical Titles by an Apothecary.

AT Wallingford Petty Sessions on the 12th inst., Mr. Arthur Augustus Sadgrove, was summoned by the Royal College of Physicians for that he did unlawfully, wilfully and falsely take or use a name, title, addition or description implying that he was registered under the Medical Act, 1858, as a Licentiate of the Royal College of Physicians of London, contrary to sec. 40 of the Act. Mr. Witherington appeared for the prosecution. The defendant defended himself. It appeared that in the autumn of last year and up to, and including the 19th May last, the defendant had on several occasions affixed to certificates of births and deaths after his name the registrable qualification of L.R.C.P. without having been so registered and, indeed, without having qualified himself for being so registered. From the evidence of the registrar of births and deaths, who produced a bundle of certificates signed by the defendant, it appeared that, notwithstanding he had cautioned the defendant not to use the registrable qualification of L.R.C.P. without being first so qualified, he continued to do so. He practically admitted the offence, but contended that as the letter L. was not added to the letters L.R.C.P. they could not be said to apply to the Royal College of Physicians, London. He further stated that, having received in June last a letter from the authorities at Somerset House, desiring him to discontinue the qualification complained of, he had not since used it. The Bench, after a short consultation, convicted the defendant in a penalty of £5, together with £5 costs.

The Medical Arrangements for the Edinburgh Volunteer Review.

THE hospital arrangements for the review are under the direction of Dr. J. P. Cunningham, Deputy Surgeon-General, the principal medical officer for the North British District, and are most complete in every detail. Dr. Cunningham has determined that the working out of these shall be to a large extent left to the volunteers themselves. Three experienced staff-sergeants from India and Aldershot, with twenty men of the Army Hospital Corps, will, however, be in attendance, for the purpose of rendering any assistance that may be needed, while an army medical officer will be attached to each division of the troops for a like purpose. There are to be three field hospitals provided—one at the Archery Ground in the Meadows; another between the rendezvous at Salisbury Crags and the Echoing Rock; while a third is to be in the hollow near St. Margaret's Loch, almost opposite the Grand Stand. Each of the field hospitals will be thoroughly equipped for any emergency, all kinds of medicines and appliances likely to be required being at hand, together with the usual restoratives and a liberal supply of ice, of which 250 lbs. is to be set apart for each hospital. Attached to each brigade there will be a "stretcher party" of medical officers equipped with a "field companion," containing medicine for the treatment of about fifty persons, and army medical corps haversacks filled with the requisite restoratives and appliances. Volunteers employed in connection with the Ambulance Corps will not require to carry rifles on parade, and a suggestion was made that they should not wear side-arms, but Dr. Cunningham pointed out that the absence of these arms implied that the person not wearing them was under arrest. The medical officers and their assistants will be stationed at the several railway stations and other points of arrival for the troops. Fine weather is all that is now required to make the Volunteer Review a complete success.

Death of Dr. Spiegelberg.

DR. OTTO SPIEGELBERG, professor of midwifery at Breslau, died on August 10th, at the age of 52, from kidney disease. The deceased professor is well known in connection with obstetric surgery and medicine, and had just completed the second edition of his "Text Book of Midwifery."

FROM diseases of the zymotic class measles showed the largest proportional fatality in Liverpool and Sheffield; scarlet fever in Leicester and Nottingham; and whooping-cough in Birmingham and Leicester. The fatal cases of diarrhoea, which had been 776 and 533 in the two preceding weeks, were 488 last week, equal to an annual rate of 3.3 per 1,000; the death-rate from this disease ranged from 0.0 and 0.3 in Oldham and Bradford, to 6.1 and 16.5 in Nottingham and Leicester. Two deaths were referred to diphtheria both in Portsmouth and Bristol. Small-pox caused 35 more deaths in London and its suburban districts, but not one in any of the other large towns.

The Army Medical Department.

THE *Indian Medical Gazette* has an article on the comparative working of regimental and field hospitals during the late War in Afghanistan. The writer of that article observes that, so long as the sick were treated regimentally the train of dhoolies was long, the bearers physically unfit for their work. Matters in these respects were most certainly not improved after the field system was introduced. He says that the surgeon *attached* to an infantry regiment was not mounted. No more were captains and subalterns; no more were young medical officers ever since there has been any army, if by the term be meant that they received no horse allowance. But all of these officers, with the exception of a very few, gladly expended a few rupees in the purchase of a horse or "tat" of the kind well represented in one of the wood-cuts in that very excellent description of Indian life in the olden time, "The Adventures of a Griffin." It is expressly stated that after field-hospitals had been first established there was a good deal of opposition between medical officers and baggage-masters; in fact, that difficulties arose as to what did or what did not pertain to a field hospital. So it has ever been; so things will continue to be.

The *United Service Gazette* understands that representations from commanding officers as to the loss to the service incurred through the entire separation of the Army Medical Department from regiments have of late been so urgent that some partial return to the regimental system is very probable. The advantages of having, at all events, one doctor permanently attached to every regiment or battalion are so obvious that it is hardly worth while to repeat them. This is especially the case in India, where the term of service is now to be extended, and where it would be most desirable to give a medical officer more interest in the health of a particular corps than he can possibly have under the present system, which is fatal to individual responsibility.

The Apothecaries' Hall of Ireland.

At the annual meeting of the General Council of the Apothecaries' Hall of Ireland, convened by authority of the Act of Incorporation, on Monday, August 1, 1881, the following were elected office-bearers for the ensuing year:—
Governor: Thomas Collins. *Deputy-Governor*: Robert Montgomery. *Court of Directors and Examiners*: Edward H. Bolland, John Evans, Arthur Harvey, Charles Holmes, Charles Henry Leet, Charles Frederick Moore, Henry P. Nolan, Jerome Flaherty, Edward J. O'Neill, Sir George B. Owens, John Ryan, James Shaw, George Wyse. *Examiners in Arts*: Henry Colpoys Tweedy, M.D., ex-Scholar Trin. Coll. Dub.; George Y. Dixon, B.A. Univ. Dub. *Representatives on the General Medical Council*: Thomas Collins. *Secretary*: Charles Henry Leet.

In May last Mr. Eugene Comerford Clarkson, Q.C., of East End Lodge, Pinner, was bitten on the cheek by a favourite dog of his own, but no ill effects, it is said, were apparent until Monday last, when the unfortunate gentleman was seized with violent pains in the head and he gradually became worse until his death on Friday last.

The Lady Doctors and the Medical Congress.

A VERY startling statement has been current in the profession, and has found its way into the newspapers, to the effect that Her Majesty, through Sir William Jenner's agency, had prohibited the admission of lady doctors to the membership of the Congress by threatening to withdraw her patronage if medical ladies were allowed to take part in its proceedings. Notwithstanding the obvious improbability of the Queen taking so strong a position upon such a matter, the statement was circulated widely, and it evoked much indignation amongst the sympathisers with the lady doctors; but, as we expected, it has turned out to be a complete fabrication. A contemporary has "authority for stating that the report is utterly and totally without foundation, that no such statement was ever made by Sir W. Jenner, and that the decision to exclude the lady doctors was the deliberate conviction of the large majority of the Committee." The disclaimer is satisfactory even to those who approve of the doors of the Congress being shut against female practitioners.

The Farr Testimonial.

It is announced that the sum of £930 only has up to the present time been received for the fund which was formed to present a testimonial to Dr. William Farr, C.B., F.R.S., on his retirement from the post which for so long a time he had worthily filled in the office of the Registrar-General. This sum has been temporarily invested, and as at least twelve months has elapsed since the inauguration of the movement, it is not intended to keep open the list after the amount has reached £1,000. This latter sum it is proposed at the request of Dr. Farr, to invest for the purpose of supplementing the small provision he has been enabled to make for his family.

Complete Obliteration of the Common Bile Duct without Jaundice.

At a recent meeting of the Société de Biologie, MM. Hanot and Gombault reported a case of sclerosis of the pylorus, with fibrous transformation of the hilum of the liver. On dissection and examination with the microscope, it was found that the common bile duct, the cystic duct and the hepatic artery were completely obliterated; the obliteration of the portal vein was not complete. There had never been any trace of jaundice while the patient was alive.

MM. Hanot and Gombault consider that the pathogenesis of jaundice is far from complete elucidation, and that the facts in this case might be variously interpreted. In the pathogenesis of jaundice, the condition of the excretory bile ducts is not the sole subject for consideration; the state of the vessels which carry to the hepatic parenchyma the elements of secretion, as also the state of the secreting organ itself, are both subjects of primary importance.

In this case the ductus communis choledochus was obliterated; but, at the same time, there was complete obliteration of the hepatic artery, and incomplete closing up of the portal vein. It may then be admitted that the biliary secretion was, if not abolished, at least very

notably diminished, so that its retention did not suffice to produce the phenomena of icterus.

The tissue of the liver presented the microscopic lesions, which are produced experimentally by ligation of the common bile duct and portal vein, a sort of compound cirrhosis, venous and biliary at the same time.

Sclerosis of the Ear in Railway Employes.

At a recent meeting of the Paris Surgical Society (*La France Médical*) Dr. Terrillon drew attention to the occurrence of a sclerous otitis among railway employes. He had had recently consulting him a man formerly employed on the Chemin de Fer du Midi. In him the evidences of sclerous otitis were well marked. When he was on duty it often caused him to ask whence a signal came; and ultimately it compelled his retirement. He presented the usual symptoms of sclerosis particularly that of hearing better in a noise.

Moss, of Heidelberg, drew attention to this subject at the Otological Congress in 1880. He reported eight cases observed in railway employes. In one case an accident happened through the deafness of an engineer. The affection attacks both ears at once and is caused by the duties of railway servants, especially those who frequently pass through tunnels.

PROFESSOR ESMARCH and Professor Langenbeck have had the honour of being presented to the Queen by the Crown Princess of Germany.

In the principal foreign cities the rates of mortality, according to the latest official weekly return, were in—Calcutta 22, Bombay 37, Madras 33; Paris 29; Brussels 25; Amsterdam 20, Rotterdam 23, The Hague 25; Copenhagen 18, Stockholm 21, Christiania 16; St. Petersburg 54; Berlin 53, Hamburg 27, Dresden 35, Breslau 45, Munich 34; Vienna 26; Prague 31; Buda-Pesth 39; Venice 32; Alexandria 42; Brooklyn 35, Philadelphia, 28, and Baltimore 31 per 1,000 of the various populations.

THE annual rates of mortality last week in the principal large towns of the United Kingdom were—Bradford 14, Edinburgh 17, Wolverhampton 17, Oldham 17, Norwich 18, Plymouth 18, Manchester 18, Sheffield 19, Newcastle-on-Tyne 19, Bristol 20, Glasgow 20, London 21, Birmingham 21, Salford 21, Dublin 22, Portsmouth 22, Hull 22, Brighton 22, Sunderland 24, Liverpool 24, Nottingham 26, Leeds 26, and Leicester 36 per 1,000 of the population.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

THE NORTH OF SCOTLAND MEDICAL ASSOCIATION.—The annual meeting of the North of Scotland Medical Association was held in Aberdeen on the 30th ult. Dr. Lyon, Peterculter, the president, delivered an address, in which he compared the present method of treatment of certain diseases with that adopted by medical men some forty years ago. The Association discussed the Notification of Infectious Diseases Bill,

expected to come before Parliament at an early date, the purport of which is that notification of such diseases shall, as soon as possible after their outbreak, be given by the medical officer attending the case to the sanitary authority of the burgh or district. Dr. Beveridge pointed out that in the burgh of Aberdeen the inhabitants were independent of an Act of this kind because of the new Corporation Bill (which comes into force to-day), and by which compulsory powers, very nearly identical with those of the proposed measure, enabled the Town Council to compel all registered practitioners of medicine, under a penalty, to give notice of every case of infectious disease of the ordinary zymotic kind coming under their cognisance, and that within twenty-four hours after their acquaintance with its outbreak. The bill, he further pointed out, referred to two points applying exclusively to England—the Public Health Act of 1875, which did not apply to Scotland, and to the Local Governing Board, a body which in Scotland had no authority at all. Some amendment of the Public Health Scotland Act (1867), he was of opinion, should be made, so that the authority of that body should be extended to Scotland, an arrangement by which the Board of Supervision would be superseded. The Association resolved to continue a committee which for some time past had been in communication with all the medical societies in Scotland on the question of establishing a fixed rate of medical-legal fees, but which had hitherto been unable to obtain from these societies a definite expression of opinion on the subject. It was also agreed to join in the invitation issued by a number of the public bodies in Aberdeen to the British Association to visit that city in 1883.

KILCREGGAN—WATER SUPPLY.—The Local Authorities of Kilcreggan and Cove have taken steps to secure a proper supply of water to the district. It is proposed to bring the water from a loch on the estate of the Duke of Argyll, nearly ten miles distant from the burgh. His Grace promises to give the water and the necessary lands free; to lend the sum of £9,000 (the estimated cost of the scheme) for fifty years at 4 per cent.; and to give an immediate subscription of £500. This arrangement commended itself to the local authorities, and every effort will be made to get the works completed for next season. No engineering difficulties of any magnitude are anticipated. The water has proved on analysis, to be of excellent quality, and as the loch is 500 feet above the level of the sea, the pressure will be all-sufficient for fire-brigade purposes.

INVERNESS-SHIRE LOCAL AUTHORITY.—A meeting of the Local Authority of the county of Inverness was held last week to consider the advisability of petitioning the Privy Council to prohibit the importation of Irish cattle into Scotland. The Chairman pointed to the fact that pleuro-pneumonia had broken out in Aberdeenshire among the animals brought from Ireland in January, and which had remained healthy to the present time, and that the period was now approaching when large Irish stocks would be sent over to the northern markets. He suggested that the clerk should be instructed to communicate with other local authorities to ascertain whether they would be willing to join in a memorial to the Privy Council asking for the prohibition of the importation of Irish cattle. The suggestion was adopted.

“THE DUST NUISANCE IN EDINBURGH.”—Surely at this dusty period of the year the Town Council might see that the streets are kept well watered. Edinburgh, from its site, is most exposed to wind from every quarter of the compass, and as every inhabitant puts his dust and ashes every night into the street the amount of dust blown about in the city is at times almost unendurable. Cannot Dr.

Littlejohn, whose practical application of his advice given twice yearly to his class that a health officer should be seen by the ratepayers, and which necessitates his rapid peregrinations about the city as part of the fundamental duties of a health officer, suggest to the authorities the advisability of watering the streets and thus help to keep down the germs of disease so troublesome to the followers of Lister?

PROFESSOR ANNANDALE ON QUACKERY.—In his valedictory address to the newly-capped graduates of the University of Edinburgh, Professor Annandale uttered a warning with regard to quackery both without and within the ranks of the profession, and proceeded to give some advice on the subject. The quackery outside the legitimate bounds of the profession was practised by uneducated and, as a rule, very ignorant and unprincipled persons, and was a result of the public demand for marvellous cures. The demand created the supply, and for this form of quackery the public themselves were almost entirely to blame, although inattention or carelessness on the part of members of the profession did in some few instances encourage their patients to take the advice of a quack. To meet this form of quackery the Professor recommended that the medical practitioner, having due respect for himself and for the welfare of his patient, could not condescend to meet in consultation a quack, but that his duty was to inform his patient of the risk he ran by submitting to unrecognised modes of treatment, and then to express his intention of being present when the quack arrived. Should the quack make his appearance, which was not often the case, the medical practitioner should state in the presence of the patient and his friends the nature of the injury and the method of treatment adopted, and then leave all responsibility as to the result on the patient and the quack, and if the former then accepted the services of the latter to leave the house at once. With regard to the intrinsic quackery of the profession, the Professor admitted that he was treading on delicate ground. "Every professional action or word, spoken or written," he stated, "founded on what is false, or which is in the slightest degree dishonest, or exalts self, to the disparagement of a fellow practitioner, constitutes this kind of quackery. If a member of our profession allows it to be considered by his patients and the public that he alone possesses some special virtue, knowledge, or treatment which can cure them of disease, I consider that he is practising quackery. If a member of our profession persuades those who consult him that all diseases arise from one source or from one common centre, which source or centre he has taken under his special care, he is practising quackery; and if a member of our profession magnifies his cures, and talks in private and general society of them, and of his successful practice, he is quacking; and if, in doing so, he insinuates anything to the injury of another member of the profession, he is a quack in the most insidious and dishonourable sense. If there can be any excuse for this form of quackery it is that many persons by their longing to be quacked upon encourage it, and even demand it." But even this excuse cannot be accepted by an honorable profession. There is also another form of quackery, not mentioned by the Professor, of which the profession is guilty: quackery by proxy, if such a term be allowed to the system now so much in vogue of members of the profession lending the authority of their names to pushing tradesmen. In many cases we fear that the presence of a well-known name to some new syrup or diet for infants is a purely commercial transaction between the

owner of the name and the proprietor of the compound, who well knows how ready the public are to buy anything on the label to which the names of the heads of the profession are attached. To remove and prevent the future occurrence of these forms of quackery Mr. Annandale laid down certain axioms, but all of them may be summed up in the one word "reciprocity," in which Confucius included the whole duty of man.

COMBE LECTURES.—Dr. Andrew Wilson, who successfully inaugurated the "Combe Lectures" in the provinces, Edinburgh, and Glasgow last session, will, by arrangement with the Combe Trustees, take the southern districts as his field of operations this ensuing session. Dr. Wilson will deliver the Combe Lectures at Galashiels and Hawick, and will also give a "Health Course" at Dundee; whilst, as already mentioned, his duties as Combe Lecturer will also include the delivery of a series of lectures in Edinburgh under the auspices of the Trades' Council. Dr. Stirling, Professor of Physiology in the University of Aberdeen, will deliver the Combe Lectures in Aberdeen and northern parts of Scotland.

Correspondence.

ROSBACH WATER.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—My attention has been directed to an article which appeared in your paper of August 10th. The article bears the title "The Medical Press Analytical Reports on the Principal Bottled Waters. By Charles C. R. Tichborne, LL.D. and with Notes on Their Therapeutical Uses, by Prosser James, M.D."

In the article there is an account of the Rosbach Water, which was introduced to the English public mainly on my recommendation in the year 1878. There is a passage in that report which makes a misrepresentation of a gross character. I quote the passage: "The only published analysis of this water is the one put forward by the company. To issue such a meagre analysis is absurd, and if they wish to gain public confidence the proprietors will do well to publish a more detailed account of its composition. It contains, according to Professor Wanklyn,—

	Grains.
"Chloride of sodium	83.0
"Carbonate of calcium	25.7
"Carbonate of magnesium	12.6

121.3"

Having found fault with the company and the analyst for not giving more analytical details, the writers of the article go on to state that they "have not the quantity or time for a thorough examination, having only one small bottle at our disposal, which we have devoted simply to the determination of the absence or presence of organic impurities."

The gross misrepresentation of which I complain is the assumption conveyed by the above extracts that no examination of the organic character of the Rosbach Water has been made by me; and I wish to make known to your readers that the very report quoted by Drs. Tichborne and Prosser James contains the particulars of three analyses by the ammonia process, made by me.

Besides the gross misrepresentation to which I have just directed attention, the article by Drs. Tichborne and Prosser James contains much to which those who have special knowledge of these subjects will be inclined to take exception. These gentlemen, who tell us that they had only one small bottle of Rosbach Water at their disposal, and that they had devoted it simply to the determination of the absence or presence of organic impurities, go on to pretend that they have proved the inaccuracy of the mineral analysis by their own experiments by concealing from their readers that my tabular statement is supplemented by other information contained in my report to the Rosbach Company, which is the subject of their criticism.

Drs. Tichborne and Prosser James open their article with

an analysis of St. Galmier Water, and, inasmuch as they quote nobody as to St. Galmier, I presume we are to conclude that in that instance the analysis is their own. It is what its authors would, no doubt, term an elaborate analysis, and is embodied in a tabular statement containing the names of no fewer than sixteen different substances. The curious part of this apparently exhaustive analysis is that when a chemist examines it he finds that it hardly gives any precise information.

Thus when the chemist asks how much lime is there in a gallon of St. Galmier water, the only reply given by the analysis is that the quantity is between 5 and 24 grains. On inquiry, how much magnesia, a similarly ambiguous answer is given. The analysis contains no data which admit of calculation how much sulphuric acid would be required to neutralise a gallon. Even the simple question how much solid residue does a gallon of St. Galmier water leave when it is evaporated to dryness in the water bath is hardly answered by this apparently elaborate analysis. Now let the chemist ask similar questions of my "meagre and absurd" analysis of the Rosbach water, and the reply is precise in every instance.

In conclusion, there is a statement of a personal character, which requires contradiction. After relating that I say that Rosbach water forms an exception to the generality of table waters, inasmuch as it may be taken daily in considerable quantities, your writers make the assertion that my name is appended to the published reports of other table waters.

Since the Rosbach Water came out my name has not been appended to the report on any other table waters, and before the appearance of the Rosbach Water, there was only one table water to which I gave a certificate. That water was the Apollinaris, and my recommendation was of a very modified character.

I still adhere to my opinion as to the superior excellence of Rosbach over other table waters.

I remain, Sir,

Your obedient servant,

J. ALFRED WANKLYN.

7 Westminster Chambers,
11th August, 1881.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—We have before us your paper of the 10th inst., in which you have reviewed Rosbach water. As, however, your statements are calculated to mislead, we must, in justice to the Company, request you, in your next issue, to put the matter in its proper light before the public.

Had you given the full report and analysis of Professor Wanklyn, your readers would have seen for themselves that the water contains the substances (although in minute quantities) which you pretend to have discovered, and we think that, in all fairness, you ought to publish this report in full.

You say that Rosbach can be so "easily imitated, owing to its simplicity." In order to do this it would be necessary to obtain an *absolutely pure* water, by extracting all the mineral ingredients, and then to add, artificially, the ingredients of Rosbach. Anyone who gives the matter a moment's thought, must acknowledge that you are suggesting what is utterly impossible.

It seems to us strange that although you admit that you had neither the time, nor the quantity of water necessary, to make a thorough examination, you should treat, in an off-hand manner, the analysis which has been exhaustively made by Professor Wanklyn (and which has been confirmed by others). And while you acknowledge that you really know nothing about the ingredients of Rosbach, you impute to us that we publish an incorrect analysis, and to Professor Wanklyn, that he states what is untrue.

We request you, in your next issue, to withdraw all the expressions you have made prejudicial to us. Nothing will please us better than that you should make a careful examination of the water, and for this purpose you are at liberty to take what you require from either of the wharves where our stock lies. A careful examination will prove that Rosbach is remarkable for its extreme purity, and that owing to the few ingredients it contains, it can be, and is, "taken daily in con-

siderable quantities, with perfect safety, which cannot be said of any other mineral water at present before the public."

We remain,

Your obedient servants,

ROUQUETTE & Co.,

For the Rosbach Company, Limited.

35 Finsbury Circus, E.C.
London, 12th August, 1881.

[We have inserted Prof. Wanklyn's letter because we have done him a slight injustice in one unimportant point. In speaking of his laudations of other waters besides the Rosbach we used the plural number. We were under the impression at the time that he had reported upon a well-known English water. We find now, however, that in this case it was another analyst. As Prof. Wanklyn states that he had only reported upon one previous to the Rosbach report, we are quite convinced it is so, and apologise for the error.]

But what difference does this make to the position? At the time we wrote the article upon the Rosbach water we had Prof. Wanklyn's printed report upon the Apollinaris water before us. He speaks of that water in the most complimentary terms. It runs:—"I need only here say that I have repeatedly, during the last two years, examined its organic purity, and have been able always to testify that it possesses in the highest degree that valuable quality." Again, after reviewing the numerous advantages of this water, he says:—"Looking to all these facts, I feel justified in stating that Apollinaris water is, so far as I know, *unique* among effervescent waters." We ask, is it consistent therefore, for the same writer, some time afterwards, to say—"It will therefore be seen that the Rosbach water may be taken daily in considerable quantities with perfect safety, which cannot be said of any other mineral water."

Was not Prof. Wanklyn's Apollinaris report issued with the object of inducing the public to drink that water; and now we find, according to the Professor, that there is only one water in the world which can be drunk with perfect safety. Does Prof. Wanklyn perceive that if we accepted his statement without protest we should be stultifying ourselves as regards our previous reports, in which we had spoken highly of many of the other waters.

Now for the "gross misrepresentation," as the writer terms it. We confess we are at a loss to understand the cause of complaint. Prof. Wanklyn complains that, although we have copied his analysis, we have not given the whole of his report, particularly that part which deals with the ammonia process. We can only say that, as regards this water, we have followed out the plan adopted through these reports; that is to say, where the water has been recently analysed by an acknowledged authority, we have given that analysis, with the authority's name, and in no case have we gone outside the analysis except there was some part in the report which called for special remark. In this particular case we have used Prof. Wanklyn's analysis, and taken exception to two points in his report. In this treatment he is in good company, and the reports of Bunsen, Fresenius, Attfield, &c., have been treated on the same principle. Had Prof. Wanklyn read the introduction to our Reports he would have found that the object of these articles was to afford the public and the medical man the most reliable series of analysis, and an examination of the mineral waters as they were found in the bottled form. One of the points adopted was the application of Prof. Wanklyn's ammonia process, and if it were not out of respect to the inventor of that process, the answer to his remarks would not have extended to the length they have. The Professor should have felt complimented that his opinion of the freedom of Rosbach water from organic impurities was endorsed by us, surely not offended.

The other point to which we objected, and in which we have not had our opinion changed, is the fact that the analysis of Rosbach water, as given by Prof. Wanklyn, gives the chief ingredients of the water only, and that all the substances that occur in small quantities are omitted. In other words, the analysis as printed would represent, and lead the public to infer, that this water only consisted of *three salts*, containing three bases and two acidulous radicles. That the composition of the Rosbach water in the bottled form is much more complicated is evident. We can easily detect *six bases* and *four acidulous radicles* without submitting the water to any process

of concentration, and we have no doubt that the list could be very largely extended by operating upon large quantities of the water.

We referred in our report to the small amount of sulphates present in this water, which is certainly a peculiarity. Prof. Wanklyn again complains that we have withheld a remark that he makes in his report in connection therewith. The said remark was really so indefinite that it could hardly be construed into a statement that sulphates were present. It says—"On inspecting the above analysis," (the above analysis contains no mention of sulphates) the peculiar features presented by its mineral constituents are the almost entire absence of sulphates." We really did not read this as wishing to convey that sulphates were present. Since receiving Professor Wanklyn's letter we have estimated the quantities of sulphuric acid present in the bottled Rosbach water, and find that it amounts to about 2½ grs. per gallon calculated as sulphate of sodium. Surely more than 2 per cent. or the entire solids is more even than a "trace." Therefore, why not insert this sulphate of sodium, the iron, and the other ingredients into the analysis. Our idea of mineral water analysis is that, as the refinement of analytical chemistry enables us to estimate minute quantities, we should try and apply it where possible to the solution of the problem of the efficiency of some mineral waters over others. Bunsen is evidently of the same opinion, for he goes to the trouble to evaporate half-a-hundredweight of water to estimate .049 of a grain of arsenic per gallon.

As regards the remarks contained in the letter from the Rosbach Water Company, they have been mostly answered in the above reply to Prof. Wanklyn, if we except the statement put forward in their letter, in which they write:—"You say that Rosbach can be so easily imitated owing to its simplicity." If they will refer again to our report they will find that we never made use of such a phrase, or indirectly implied it. We shall be most happy to undertake a full analysis of the Rosbach water if they wish it, or would be happy to join Prof. Wanklyn in an investigation as regards the minute composition of this water, but, at the same time, must reserve to ourselves the right of fair and straightforward criticism.—
Ed. M. P. & C.]

CALF LYMPH.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In reply to Dr. Warlomont's lucid and courteous letter, I would remark that the proof he offers of the efficacy of animal lymph against small-pox by the non-success of subsequent re-vaccination seems to me somewhat ambiguous. Firstly, because, assuming the test to be reliable, the humanised lymph must be degenerate indeed, since, according to Dr. Warlomont and Dr. Renner, recent re-vaccinations with calf lymph have been successful in ninety per cent. of the cases; whence it would follow that nine out of every ten once-vaccinated persons are as liable to small-pox as the unvaccinated. Secondly, agreeing that the virus of small-pox is essentially distinct from that of natural cow-pox, are we justified in assuming that insusceptibility to the one means insusceptibility to the other? Thus, sheep-pox, which closely resembles variola and protects against itself, is admitted on all hands to give no immunity from small-pox.

With regard to the two cases of fatal small-pox after animal vaccination, to which I alluded, I may say that I am assured by the father of one patient and husband of the other, that both were successfully vaccinated with animal lymph while staying in Hamburg. Both were afterwards attacked by small-pox, the one in the confluent, the other in the malignant form, and both died. Several years elapsed between their vaccination and death.

Dr. Drysdale calls the evidence of the Lyons Commission negative; but I fail to see how that can be when the result of the inoculation of four children with lymph obtained after Mr. Coely's plan was to produce a definite attack of small-pox and give rise to a little epidemic of the same among the inmates of the ward.

I am, Sir,

Yours obediently,

W. J. COLLINS, B.Sc., M.R.C.S.

St. Bartholomew's Hospital,
August 14th.

THE ISLE OF WIGHT AS A SANITARIUM IN DISEASES OF THE CHEST.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The visit of the British Medical Association to Ryde has afforded me an opportunity of revisiting some of the well known resorts of our consumptive population, and I have been much struck with the advantages which Ryde, Ventnor, and Bonchurch offer to the phthisical, and also to sufferers from chronic bronchitis and asthma.

To commence with, Ryde is a most healthy town, possessing a delightful pier, where the invalid can very profitably spend the summer months of June, July, and August, as the exposure is northerly, and hence there is no oppressive heat. During the meeting of the Association, indeed (9—13 August) it was rather too cold for the time of the year; so that consumptives, who suffer so terribly in many cases in hot weather, are not likely to be incommoded by a residence at Ryde, even in midsummer.

The environs too, of that town are most agreeable, and the vegetation superb in many instances. Some of us visited the grounds of Mr. S. Locock, at Binstead House, about a mile from Ryde, and were shown by the learned proprietor a number of trees, the like of which for foliage and vigour I have only seen equalled in the Channel Islands or in Spain. The Royal Isle of Wight Infirmary on the Swanmore Road is a noble institution, and has the great advantage of possessing among the members of its able staff, a gentleman, Dr. Davy, who combines a most thorough acquaintance with surgery, with a most accomplished knowledge of hygiene. In many ways Ryde is, as Fielding says, the most pleasant spot in that pretty island, and I can thoroughly recommend it as a sanitarium for invalids with chest diseases during the months of June, July, and August.

In Bonchurch and Ventnor, however, we have the grand winter climates of the Isle of Wight. Ventnor has now a population of some 4,500 residents, and is full of every convenience and comfort. It is quite a splendid climate for a great class of consumptives, and patients with bronchial diseases and heart diseases in the colder months, say from September till May. I spoke a good deal to the residents there about the temperature in winter, and had extremely favourable testimony as to the agreeable character of the climate in mid-winter. Frost lasts a very short time, and the mean winter temperature, is 42° F., summer being 54°. The temperature is thus, about six degrees cooler than London in summer, and six degrees warmer in winter.

The town is entirely protected from all northerly winds by the very high hill underneath which it stands, and, for a marine climate, Ventnor seems by no means a very wet place, since the average number of days in which rain falls is but 70, and the rainfall 26 inches. Hence the poor sufferers from consumption can pass a long time in the open air almost every day of the year, and after all that has been written on the treatment of that detestable disease of our race, I think that the vast majority of the profession will agree with me, that the open air treatment of phthisis, first, proposed I think, by an American physician, is the one which meets with the greatest success, at least that is my experience. February appears to be the coldest month in Ventnor (41°) and August the hottest (62°), so that patients who can afford it should certainly not remain in Ventnor during the latter month, unless, indeed they live high up the cliff, above the level of the Railway station, where there is plenty of air, and sea-breezes are constantly blowing. The air of the downs, 600 feet above the sea, is most bracing for patients able to walk so far. We had the advantage of being shown over the Royal National Hospital for Consumption and Diseases of the Chest, by Dr. Coghill, who presided over the obstetric section of the Association at Ryde. That gentleman speaks very favourably of the progress made in suitable cases of phthisis at Ventnor. The hospital is well planned and as comfortable as any private house.

There are eight houses for female patients, each containing bed-rooms and a sitting-room for six or seven patients, and eight houses of similar design for males, so that about a 100 patients can be treated there. The patients pay 10s. a week after obtaining an order from a governor, who must pay three guineas a year. It is thus a hospital for consumptives of the middle classes. I should think Ventnor must be an admirable climate for scrofulous children, or for persons suffering from various forms of nervous dyspepsia, who suffer much in cold and harsh climates. But in diseases of the throat and air passages, such as chronic bronchitis and emphysema, Bonchurch and Ventnor seem to me perhaps the very best winter resorts of the British Islands. Indeed, I have, from my own experience, come to think that the class of patients last mentioned are likely to do better in the snug stone built houses of these charming towns than either in Cairo or in Madeira.

I remain, yours, &c.,

CHARLES R. DRYSDALE, M.D.,
Late Physician to the North London
Consumption Hospital

17 Woburn Place, London.
August 18th, 1881.

UNION HOSPITALS AND THE ROYAL UNIVERSITY.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I will thank you to allow me to acknowledge in your columns the subscriptions of five shillings each towards the expenses of our movement in favour of clinical recognition by the above university, from the following gentleman, Drs. Barry, Limerick; R. Kenny, Dublin; Daly, Rathoath; Adrien, Drogheda; Nicolls, Nowan; Laffan, Cashel; Hayes, Rathkeale; Nolan, Gort; Holland, Dungarvan; and Ryan, Ballyboro; I would urge my union *confères* to strain every energy in order to bring the justice of our case home to the minds of the senators. The first journal in the three kingdoms, and the first men in London and Du'lin have supported us with an array of facts and arguments that can have but one issue. I would direct the attention also of my *confères* to the entire exclusion of any representative of Union hospital interests from the witness table of the Royal Medical Commission. It appears as if that commission is to be a mere metropolitan rehearsal from which every unit of the flouted provincial masses is to be rigidly excluded. This is a matter which must be ventilated in Parliament early next session. When the deputation to the senate meets in Dublin, an opportunity will be afforded for all the signatories to the memorial to again indicate their choice of a representative, and I trust that the united parliamentary influence at our disposal will secure us a full hearing from that committee. A printed synopsis of reasons in favour of our clinical recognition has been distributed. In conclusion, I have only to repeat what I stated in a former letter, that the justice of our case is so clear, and the public interest so entirely on our side, that with a very moderate expenditure of money on our part success is certain.

Yours &c.,

Cashel.

THOMAS LAFFAN.

THE NOTIFICATION OF INFECTIOUS DISEASE.

THE Bill introduced a few weeks since by Mr. Hastings to make general throughout England and Scotland the system of compulsory notification of infectious disease by the attending physician has been withdrawn; its passing this year having been rendered impossible by the opposition of Mr. Thomassen to it.

The Bill was the joint offspring of the Social Science Association and Mr. Michael, Q.C., and it has been hatching for many months in the joint committee of that Association and of the British Medical Association. Eventually it was found that the two bodies could not agree because the Social Science delegates would not accept any less proposition than direct notification to the sanitary authority by the physician; while the British Medical Association would only consent to the physician being required to notify the nature of the disease to the patient, leaving him to transmit the notice to the sanitary authority. Failing thus to secure the conjoint action of the two associations, the Social Science executive introduced their Bill separately. Their hopes were, however, short-lived, for no sooner was the Bill printed than a block was put against it by Mr. Thomassen, M.P.

It is worthy of notice that this gentleman is member for Bolton, the town in which compulsory notification exists in the completest form; and the fact that the opposition to the measure emanates from him, and that he positively refuses to withdraw from his hostile position, may be accepted as strong evidence that the working of the system is not free from very serious objections.

Although Ireland was specially exempted from the operation of the Bill, yet the Irish Medical Association took immediate steps to ensure that it should not, by the omission of the exemption clause, be extended to that country.

Hoping to induce the members of the British Medical

Association to accept his Bill, Mr. Michel, Q.C., came from London to the Ryde meeting, and made a long and earnest appeal to the assembled members, but without avail, for his resolution was rejected by a large majority.

The question may now rest until next December, when preparations will be on foot for the next Parliamentary campaign. Meanwhile we hope that the advocates of this measure have learned that the profession at large, both in England and Ireland, are strongly opposed to it, and that the proposal to force the physician to notify in writing, either directly or indirectly, will, if necessary, be hotly contested.

Literature.

ELEMENTS OF PRACTICAL MEDICINE. (a)

THE present volume does not attempt to rival the larger treatises of Niemeyer, Roberts, or others, but exhibits a very handy little volume suitable to the needs of the student, or of the busy general practitioner. It can be read over in a couple of evenings, and will afford a very fair, if not very novel, conspectus of the most recent views in practical medicine. Commencing with a brief but clear view of general pathology, it next proceeds to general diseases, of which it gives a very succinct outline. In the chapter we would feel disposed to take exception to one of the statements of our author who, speaking of the maculæ of typhus fever, says that they "do not" disappear on pressure.

The late Sir Dominic Corrigan, the greatest of our authorities upon typhus fever, in his classical work upon that disease (pp. 63-64), draws the distinction between maculæ and petechiæ, by observing that the maculæ "do" disappear on pressure, and that the petechiæ do not. We would, therefore, lean to the idea that our author's statement is a typographical error; the more so as there is a large erratum prefixed to the book. There are, moreover, some errors not included in this erratum, e.g., in p. 85, line 19, the word "agminated" occurs as an obvious misprint for "agminated." The work now treats of local diseases; those of the respiratory system, of the circulation, of the digestive organs, of the urinary system, of the nervous system, and winds up with a short but good description of diseases of the skin. We can commend this little book as a fair example of *multum in parvo*. It is conscientiously carried out; it is not over-burdened with references or authorities; but will perhaps be found more practically useful than some more pretentious treatises. By the ordinary possessor, at all events, it is pretty certain to be more generally read. We trust that none of our young friends will use it too much for "cramming" purposes on the eve of their examinations.

Literary Notes and Gossip.

WE have it on good authority, that Mr. Timothy Holmes, the author, and Messrs. Longmans, the publishers of "Holmes's System of Surgery," are so enraged at the piracy and mutilation of that book in America, especially in the American edition recently issued by Messrs. Lea and Co., of Philadelphia, that they have decided to issue a new and revised edition forthwith. This edition will virtually exclude the American piracy from Great Britain, and will be, moreover a formidable competitor to Wood's "Encyclopedia of Surgery," which has been published by Messrs. Macmillan.

WE understand that it is the intention of the government of Bengal to award prizes for the best compressed translation into Urdu and Bengali of portions of "Roberts' Handbook of Medicine," "Playfair's Midwifery," and "Kanai al Dey's Medical Jurisprudence." Specimens of translation will

(a) "Elements of Practical Medicine." By Alfred H. Carter, M.D. Lond., M.R.C.P. London: H. K. Lewis, 1881. Crown 8vo, pp. 374.

be received at the Calcutta School of Medicine up to Oct. 1st, 1881. The translator selected will be required to translate the entire book hereafter.

We understand that Messrs. Wood and Co., of New York, have made arrangements with Messrs. Macmillan, of London, to publish simultaneously in the two capitals the new "International Encyclopædia of Surgery." The work will consist of six large royal 8vo volumes, edited by Dr. Ashhurst, and will be issued quarterly, commencing in October next.

It is a hopeful sign when leading men in all professions and stations of life are embarking publicly in a crusade against intemperance. The evils arising from our national vice are so shocking, that we rejoice to see Dr. Andrew Clark, in his "Lectures on the Action of Alcohol on Health," foremost among those who are resolved to wage war against this foe to Britain's greatness. This is a reprint of a lecture recently delivered by Dr. Clark, and is a valuable contribution to the literature of temperance.

DR. CLARK, whose large experience at the London Hospital, and whose extensive practice have given him unusual facilities for ascertaining the truth, bears witness to the large proportion of disease induced by alcohol. He ascribes 70 per cent. of his hospital cases to this cause. While carefully guarding his utterances by the proviso that there are some exceptional persons of feeble nervous type to whom he allows the very limited quantity of alcohol they have accustomed themselves to, Dr. Clark proceeds to class alcohol as a poison, ranking with arsenic, strychnia, and opium. This is the gist of his argument. No one can prove that a very minute dose of alcohol causes any *obvious* injury, but neither can one prove this of any other poison. Dr. Clark's exposition of the heredity of alcohol is peculiarly striking. He truly calls this "the awful side" of the question. A more trenchant blow has never been delivered against drinking, and this able and eloquent discourse has already arrested the marked attention of the public.

THE £100 prize offered by the government of India for the best "Manual of Hygiene" for the use of the British soldier in India, has not been awarded to any of the thirty-seven competitors, because the committee appointed to adjudicate considered that no one of the manuals submitted was in "all respects suitable for the purposes for which a manual is required as presented in the notification offering the prize."

At the late International Medical and Sanitary Exhibition, several of our leading publishing firms exhibited, and under Section XVII for books, &c., Drs. Alfred Carpenter, J. H. Gladstone, W. A. Meredith, and Mrs. Garrett-Anderson, M.D., were appointed as judges. But the idea of awards for books appeared so ridiculous, that in the list, they were conspicuous by their absence. We think the judges acted wisely in this respect.

We congratulate Mr. Pridgin Teale on the rapid call for a third edition of his excellent book "Dangers to Health;" the circulation of this class of literature among the general public is fraught with much good. Another useful book particularly to the general public, Dr. Wilson's "Ocean as a Health Resort," has also reached a second edition very quickly; whilst that quaint production by Mr. J. S. Wood "A Booke of Ye Old English Fayre," has sold so rapidly that a fifth thousand has been called for in three months.

DR. STANLEY HAYNE'S little book "Healthy Homes" is an amplification of a popular lecture, and is well worthy of a more extended audience than that usually accorded to the discussion of important sanitary subjects. It contains a great deal more information than its title suggests, for, besides the "House, its situation and building," we have remarks on the food of infants, clothing, bedding, bathing, &c. The suggestions are in the main useful and judicious, but we think that a temperature of from 300 to 400 deg. Fahr. is a little too high to which to expose clothes without running the risk of scorching them. We are always ready to welcome every attempt to diffuse sound sanitary knowledge among the people and we therefore hope that Dr. Hayne's pamphlet may have the circulation which it certainly merits.

DOMESTIC PLUMBING AND WATER SERVICE, by William

White, F.S.A., contains a little information on the subjects mentioned in its title, all, however, leading up to the remedy for all the evils of the present system by the adoption of the author's water-closet and water waste preventer, known as the "Shrewsbury Patent Closet." The price of the book is not stated, but we are of opinion that all trade advertisements should be given to the public. To send to one's bookseller for a work on "Domestic Plumbing and Water Service," and then to find that it is little else than an advertisement is a little provoking.

IN "Ventilation and Heat," Mr. Edwards has produced a most interesting and useful book, and one that will well repay careful perusal. The first chapter contains a brief account of the labours of the early pioneers in the science of ventilation, and is a repetition of the old story that the path of inventors and reformers is not strewn with roses. The next chapter deals with "some simple appliances for ventilating dwelling houses," we then have an interesting chapter on London smoke and fog, and the best methods for removing them, some of which are, we fear, too Utopian to be adopted in an age where, as long as people see a bright cheerful fire in their grates they are perfectly oblivious to the fact that the tops of their chimneys are emitting a heavy and poisonous compound of carbon and various gases. The rest of the book is taken up with a discussion on modern fire-places, ventilation and smoky chimneys, with an account of a grate invented by the author. There is a passage in an old Persian poem to the effect that "well is he by whom that which is his benefit becomes the benefit of another," and on this score we would not rob Mr. Edwards of the merit of trying to show us how we may better warm and ventilate our houses. The subject is an important one, and it is just possible that the want of proper ventilation, with the depressing influence of constantly rebreathed air, is one of the factors which plays a not unimportant part in furthering the drinking habits of the poor. The book is well printed and illustrated, and we again confidently recommend it to the attention of our readers.

NEW BOOKS AND NEW EDITIONS.—The following have been received for review since the publication of our last list, July 27th:—Manual of Dental Surgery and Pathology, by Alfred Coleman, L.R.C.P. Fashion in Deformity, by W. H. Flower, F.R.C.S. Throat Diseases and the Laryngoscope, by Douglas Hemming, F.R.C.S. Ed. The Floating Matter of the Air in Relation to Putrefaction and Infection, by John Tyndall, F.R.S. Annals of Chemical Medicine, vol. ii., by J. L. Thudichum, M.D. Health Preservation, by R. Herring. The Ocean as a Health Resort (2nd ed.), by W. S. Wilson, L.R.C.P. Dangers to Health (3rd ed.), by T. Pridgin Teale, M.A. Tropical Dysentery and Chronic Diarrhoea, by Sir Joseph Fayrer, M.D., F.R.S. Medical Heresies, by G. C. Smythe, M.D. A Booke of Ye Old English Fayre, by J. S. Wood. Indigestion and Biliousness, by J. Milner Fothergill. Mineral Waters, by Paul Kilian, M.D.

Medico-Parliamentary.

THE POISONING OF MR. HONE.

MR. GIBSON asked the Chief Secretary whether his attention had been called to the recent lamentable death by poisoning of Mr. Hone, in Limerick, and whether he will take steps to have a thorough and satisfactory investigation into the occurrence, so as to discover who was liable for the carelessness which caused his death, and to prevent a possible recurrence of similar catastrophes.

MR. FORSTER said he had seen a report of the sad occurrence. He need not inform the right hon. and learned gentleman that there were two ways in which an inquiry into the cause of death might be conducted—one being by means of a coroner's inquest, and the other by means of a magistrate. He found that in this case there had been a coroner's inquest on the remains of Mr. Hone, and that the verdict was that the cause of death was carbolic acid accidentally taken instead of a black draught. The jury attached to their verdict a statement of their opinion that all poisonous drugs should be carefully kept under lock and key—an opinion in which he need not say he entirely concurred. The jury did not name any particular person as being responsible for the death of Mr. Hone. Two persons were arrested on suspicion of being concerned in the death. They were detained in prison for two days, and finally discharged. He had received from the magistrate a report stating that the death of Mr. Hone was clearly the result of accident, and under those circumstances he did not see what further steps he could take in the matter.

Mr. GIBSON asked the right hon. gentleman whether he would see if, with the means at his disposal, there could not be a more thorough inquiry (hear, hear).
Mr. FORSTER said he was told by the magistrate there could be no further inquiry, but he would see what could be done (hear, hear).

NOTICES TO CORRESPONDENTS.

LOCAL REPORTS AND NEWS.—Correspondents desirous of drawing attention to these, are requested kindly to mark the newspapers when sending them to the Editor.

DR. A.—You are quite right, it was an absurd error, but such as is by no means uncommon with that particular journal. Your supposition that the elder had resigned in favour of the younger was proved to be not well founded by the address itself, which could only have been written by the more senior member of the family. Write again about the book.

IRREPUTATENET POPULA MEDICINA LITERIS.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

"He who is able to express a dubious simile in foreign dress,
Will pass for learner than he that's known
To press the strongest reason in his own."

The President of the Medical Section distinguished himself by an undreamt-of proficiency in German."—WEEKLY PAPER.

SIR,—A report of the "Introductory Address on Obstetrics" in your last number represents the President of that section as saying—viz., "Either Swift or Pope alludes in his poetry to 'Arbuthnot's soft obstetric hand.'" This, I apprehend, to be a "misconception." It was not of Dr. John Arbuthnot, but of Dr. James Douglas, Pope wrote what follows in Book 4 of "The Dunciad,"—viz.:

"To prove me Goddess! clear of all design,
Bid me with Pollio sup, as well as dine:
There all the learn'd shall at the labor stand,
And (a) Douglas lend his soft obstetric hand."

(a) Dr. James Douglas, a physician of great learning, and no less taste, above all curious in what related to Horace, of whom he collected every edition, translation, and comment, to the number of several hundred volumes, died in London, 1742, the very year in which the fourth book of "The Dunciad," that compliments him, was published. He was author of "Notices of Anatomical Writers from Hippocrates to Harvey," Lecturer on Anatomy, &c.—*Vide* BOHN'S EDITION OF POPE'S WORKS.

Now, if the President had quoted German, like his "brother of the Medical Section," he would have been very much less liable to correction. Faust being a favourite hunting ground with aspiring and select M.D.s, and as yet (more or less)—"CAVIARE TO THE GENERAL."—(Practitioner.) By the way, a little further on than the passage quoted by the Medical President, is the following, viz.:

FAUST TO WAGNER.—"Und wenn's euch ernst ist was'zu sagen—
Ist's nōthig worten (analkindiah auführung)
nachsnjagen?"

Aug. 15, 1881.

SARSFIELD.

DR. G. GRIFFITH.—We shall be pleased to examine the paper for insertion, but unless there is a fair argument to show that the poison of typhoid fever is the same as that of the other diseases mentioned in your letter, we may feel called upon to decline it.

MEDICAL EVIDENCE.—A correspondent asks "What amount can he claim at law for attending at the sessions, a distance of about twelve English miles from his residence, to give professional evidence in a case for the plaintiff who subpoenaed him? Plaintiff refused to pay when giving the subpoena, and the witness had the misfortune to be sworn before claiming remuneration from the judge, who then refused it because he had taken the oath.

[Our correspondent has no legal claim for a fee. He might, without much risk, have stayed away, or he might have appealed to the judge when called upon to swear, and it is probable that he would not have been compelled to testify without payment guaranteed. If he got his *viaticum* with the subpoena he can claim nothing more.—ED.]

G. HARRISON YOUNGE, A M.D.—Letter received, and will appear in our next.

COLONIAL MEDICAL APPOINTMENTS.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—Would you be so kind as to inform me in your issue for next week what is the best way to obtain a Government appointment as assistant colonial surgeon in the West Indies; if vacancies occur frequently; and the best source through which to make application; whether an appointment in Demerara is more easily secured, and the salary of each at the commencement? Yours, &c., J. K. W.

Aug. 19, 1881.

[Colonial surrogencies are obtainable by application to the Secretary of State for the Colonies, now Lord Kimberley, and the application should, if possible, be backed by personal influence. There is, at present, a want of surgeons for the West Indies, and for Georgetown, Demerara. The salary varies from £800 a-year upwards.—ED.]

NITRATE OF URANIUM.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Will you or some of your numerous readers inform me what are the therapeutic effects and dose of nitrate of uranium? Yours truly,

EUSTIOUS.

[The information is not to be found in any of the current materia medica books.—ED.]

Vacancies.

Brighton and Hove Dispensary.—Resident House Surgeon. Salary, £140, with furnished apartments. Applications to the Hon. Sec. by September 5.
Children's Hospital, Birmingham.—Assistant Resident Medical Officer. Salary, £40 per annum, with board. Applications must be sent to the Secretary not later than Aug. 31.
Clinical Hospital and Dispensary for Sick Children, Manchester.—House Surgeon. Salary, £80, with apartments and board. Applications to the Secretary on or before August 31.
Cotehill Union, Tullyvin Dispensary.—Medical Officer. Salary, £100, and £30 as Medical Officer of Health. Election, Aug. 29.
General Infirmary, Northampton.—House Surgeon. Salary, £125 per annum, with furnished apartments, &c. Applications to be sent to the Secretary on or before Aug. 29.
Knighton Union.—District Medical Officer and Medical Officer of Health. Salary, £40 and £15 respectively. Applications to the Clerk to the Guardians not later than Sept. 1.
Liverpool Northern Hospital.—Assistant House Surgeon. Salary, £70, with residence. Applications to the Chairman of the Committee not later than September 12.
Poplar and Stepney Sick Asylum District.—Assistant Medical Officer Salary, £170, with board, &c. Applications to the Clerk to the Managers not later than Sept. 5.
Worcester General Infirmary.—House Surgeon. Salary, £100, with board and lodging. Applications to the Secretary before Sept. 2.

Appointments.

BARK, J., M.R.C.S. Honorary Surgeon to Stanley Hospital, Liverpool.
BUCHANAN, J. H., M.D.St. And., L.F.P.S.Glas., reappointed Medical Officer of Health for Thirk Rural Sanitary District.
BUCK, J. S., L.R.C.P.Ed., M.R.C.S., Resident Medical Officer to the Rochester and District Friendly Societies Medical Association.
EVANS, E., M.B., C.M.Glas., Medical Officer of Health for the Anglesea and Beaumaris Unions.
GROVES, H. J. F., L.R.C.P.Lond., M.R.C.S., L.S.A.Lond., Medical Officer of Health for the Parish of Lambeth.
HARRISON, J., M.R.C.S., L.S.A.Lond., reappointed Medical Officer of Health for the Braintree Urban and Rural Sanitary Districts.
HILL, P. E., M.R.C.S., L.S.A.Lond., Certifying Factory Surgeon for the Crickhowell District.
JOHNSTON, E., M.B.C.P.Ed., L.R.C.S.I., Medical Officer for the Wymondham District of the Melton Mowray Union.
JONES, D. J., M.D.Edin., M.R.C.S., Senior (not Junior, as stated last week) Assistant Medical Officer of the Kent County Asylum, Barming Heath, near Maidstone.
JONES, E., M.R.C.S., elected Honorary Assistant Surgeon to the Liverpool Stanley Hospital.
JONES, W., M.R.C.S., Medical Officer to the Workhouse of the Strand Union.
LEEDS, M., M.A., M.B.Oxon., Physician to the Seamen's Infirmary, Ramsgate.
NOUSER, W. J. C., L.S.A.Lond., Medical Officer for the Morchard Bishop District of the Crediton Union.
PAGE, F. M., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer for the Bitton District of the Keynsham Union.
POOLLEY, Mr. T. A., Public Analyst for the Borough of Maldon.
ROWLEY, C., M.R.C.S., L.S.A.Lond., Medical Officer for the Silkstone District of the Feniscione Union.
STEVENSON, F. C., L.K.Q.C.P.I., L.R.C.S.I., House Surgeon to the Rockdale Infirmary.
THOMPSON, T. W., M.R.C.S., Medical Officer for the First District of the Hatfield Union.
TILLY, J., M.D., L.R.C.P., M.R.C.S., L.S.A.Lond., L.M., District Medical Officer and Public Vaccinator to the No. 2 Chiswick District of the Brentford Union.
TURNER, G., M.R.C.S., Medical Officer of Health for the Borough of Hertford.
WILSON, H., M.R.C.S., L.S.A.Lond., Medical Officer for the Waverree District of the West Derby Union.
WOODFORD, W. T. G., M.D.Lond., L.S.A.Lond., reappointed Medical Officer of Health for the Maidenhead Urban Sanitary District.

Births.

BRUNTON.—Aug. 12, at 50 Welbeck Street, W., the wife of T. Lander Brunton, M.D. F.R.S., of a daughter.
GIBSON.—Aug. 14, at the Curragh Camp, the wife of Surgeon-Major G. J. Gibson, A.M.D., of a son.
HEDDY.—Aug. 16, at 25 Hollywood Road, South Kensington, the wife of Wm. Jackson Heddy, M.R.C.S., of a daughter.
KELLY.—Aug. 18, at Laurence Street, Drogheda, the wife of J. Bellow Kelly, F.R.C.S.I., of a son.
SHEARMAN.—Aug. 16, at Lark Hill, Swinton, near Manchester, the wife of W. M. Shearman, M.R.C.S., of a daughter.

Marriages.

CONNELLAN—HUNT.—Aug. 11, at St. Jude's Church, Mildmay Park, London, North, A. S. Connellan, L.R.C.S.I., to Elizabeth, daughter of the late Edward L. Hunt, Esq., of Gort, co. Galway.
HARRIS—LANGLEY.—Aug. 11, at Comeragh Church, co. Waterford, James Crofts Harris, M.D., to Ella, eldest daughter of Charles Langley, J.P., of Tay Lodge, co. Waterford.

Deaths.

HOLMAN.—Aug. 9, at Hurstpierpoint, H. Martin Holman, M.D., aged 60.
LUKE.—Aug. 15, at his residence, Fingest Grove, Wycombe, Buckinghamshire, James Luke, F.R.C.S., F.R.S., aged 82.
WREN.—Aug. 9, at Litton House, Ballylongford, co. Kerry, George Wren, M.D., aged 42.

RECENT ADVANCES IN THE SURGICAL TREATMENT OF INTRAPERITONEAL TUMOURS.

By T. SPENCER WELLS,

Vice-President of the Royal College of Surgeons; Surgeon to the Queen's Household, &c.

THE term recent advances, I think, may be considered as including the advances which have been made within the recollection of most of us,—the improvements that have been made, the progress that has been secured during our own professional career, during the last twenty to thirty years. And I suppose almost everyone present—certainly everyone who has reached the age of fifty years—can remember a time when the removal of a tumour of any kind from the abdominal cavity was a surgical curiosity, exciting wonder, calling forth serious condemnation, and only encouraged by a very few of the most hopeful of our body.

Long after ovariotomy had risen from the period of distrust, and its mortality had been reduced below that of other operations of less magnitude—long after ovariotomy had secured the sanction of our profession and the confidence of the public—other abdominal tumours were left to run their course. Occasionally, perhaps after a mistake in diagnosis, a uterine tumour was removed; sometimes designedly, but at first almost as a forlorn hope; then, after a time, with an amount of increasing success which had led to the admission of the amputation of uterine tumours, or of enlarged portions of the uterus, among those surgical operations which, if not yet thoroughly accepted, are still recognised as worthy of serious consultation.

Still more recently, excision of the whole uterus affected with cancer has been repeatedly accomplished, and Porro's operation is taking the place of the Cæsarean section. The removal of an enlarged spleen has now been effected in a sufficient number of cases to prove that it is more than a surgical possibility. Not only have cysts of the kidney been cured by drainage, and renal calculi removed, but the displaced, enlarged, or diseased kidney has been extirpated; gall-stones have been removed from the gall-bladder; suppurating hydatid cysts of the liver have been drained; peritoneal hydatid tumours have been excised; and, within the last few weeks, authentic reports have reached us of excisions of portions of the stomach, and of recovery after the removal of more than six feet of the small intestine. This has

followed excision of smaller portions of intestine during ovariotomy; and a bolder course has been taken of late years in cases of obstructed intestina, of wounds or rupture of the bladder, and of extra-uterine foetation. Many of these cases will be brought before you almost immediately by Mr. Lawson Tait, whose table of a very remarkable series of cases I have only received this morning, and have not yet had time to examine.

As some of these subjects have been reserved for discussion in this Section, and others in the Section of Obstetric Medicine and Surgery, I make no further allusion to them now, and pass on to refer to three points on which I trust information will be gained in the discussion which will presently take place. They all appear to me to be intimately associated with recent advances in the surgical treatment of intra-peritoneal tumours, and in abdominal surgery generally. These three points are: 1. The union of divided edges, or separated surfaces, of peritoneum; 2. The use of pressure-forceps in preventing, or stopping, or diminishing the loss of blood during and after operations; 3. The practice of drainage in relation to antisepsis.

I should not have thought it necessary, after the progress which has already been made in abdominal surgery, to insist at any length upon what I believe now to be a fundamental principle or rule of practice accepted and adopted by all the most experienced and successful operators at home and abroad, if I had not been fiercely attacked by that singular society, which, admitting the right of man to kill all the lower animals, to use them for food, their skins for clothing, their feathers for ornament, to make them labour for our convenience, denies our right to use them for any scientific purpose, or in the hope of benefiting the human race. These curious philanthropists persistently attack me because I sacrificed a few rabbits, dogs, and guinea-pigs, in the year 1859, in order to demonstrate, beyond all doubt, for time to come, the fact that human life may be saved, and lifelong suffering prevented, by an improved mode of uniting penetrating wounds of the abdominal cavity. They argue that results observed in animals are no guide to what may happen in man; that my observations were not new, and that some believe they are not true; that some think ovariotomy has, on the whole, rather shortened than lengthened the life of woman; and that its mortality has not been lessened by the knowledge gained by my experiments on animals. Of course I have not taken any notice of these attacks; but I wish to show you exactly what I did, and leave you

to judge whether or not the human race has been served by the death of about a dozen animals twenty years ago. Here are the specimens which I have been permitted to bring hither from the Museum of the College of Surgeons. Before I hand them round, let me tell you exactly what led me to make the experiments. The first three women upon whom I performed ovariectomy all recovered. The fourth died, as I thought, without any good reason why she should have died. I was naturally much interested in the *post mortem* examination, and I obtained the invaluable service of my friend Dr. Aitken to make it. We found that the state of the inner surface of the wound was far from satisfactory. At that time, instead of the sutures I have used of late years, I used harelip-pins and twisted sutures to unite the wound; and we saw at once that some of the pins on the inner aspect of the abdominal wall were bare; the cut edges of the peritoneum were retracted; a portion of intestine was in contact with the wound, the impress of which was obvious on the surface of the gut. Some coagula of blood, and an abundant, consistent lymph exudation upon the peritoneal surface of the intestine, corresponded to the edges of the incision and the surface of the wound. Recent lymph glued the opposing surfaces of the intestines to each other. I saw at once how much better it might have been if the peritoneal edges had been accurately brought together, and had united; and thought of doing this in my next case. But I found careful instructions in text-books and treatises to avoid the peritoneum, just as some few surgeons even now fear that they may set up peritonitis, or that pus from the tracks of the sutures may get into the peritoneal cavity. So I determined rather to make the experiment *in corpore vili* than on women. Dr. Richardson kindly helped, by narcotising the animals, some with puff-ball and some with chloroform. In these specimens, where the divided edges, or rather surfaces, of peritoneum have been pressed together, you see that the smooth serous inner coat of the abdominal wall is perfectly restored. You cannot see the stitches on the inside, though plainly visible on the skin; and there is no adhesion of intestine or omentum. When skin or mucous membrane are divided, their edges must be brought together to secure direct union. If they be inverted union is prevented. The exact opposite holds good with serous membrane. The edges should be inverted, and two surfaces of membrane pressed together, so that the sutures are not seen; and the effused lymph makes so smooth a surface that even the line of union cannot be seen. In these specimens you can only discover it by the line of sutures in the skin. But mark the contrast in these other specimens, where the peritoneal edges were purposely excluded from the sutures. In every case where the animal was not killed within a day or two, intestine or omentum adheres to the inner surface of the abdominal wall, thus completing the peritoneal sac, at the great risk of intestinal obstruction, or of permanent discomfot to the survivor, to say nothing of a want of firm union, and subsequent ventral hernia. One can hardly understand the so-called reasoning which insists that this should not be demonstrated once for all in a few narcotised animals; but that we should grope our way to the realisation of the truth through the sufferings and by the dissection of a series of women. You can examine the specimens now, and they will remain in our College Museum, and will serve, I trust, to dispel any doubt which may still be felt as to the best mode of uniting penetrating wounds of the abdominal wall. And I will go still further, and say that, whenever edges or surfaces of peritoneum are divided or separated, they should, if possible, be reunited. Peritoneum must be opposed to peritoneum; and this can only be done by drawing it over the pedicle, or stump, or divided parts, and fixing or uniting it as an envelope by a line of sutures, or by the uninterrupted suture. I have already urged this so persistently in my works on diseases of the ovaries; in the Hunterian Lectures at the College of Surgeons, in 1878; in a paper on the removal of uterine tumours, brought before the British Medical Association, at Cambridge, last year; and in some recent papers, that I will at once pass to another improvement which has added to the success of abdominal surgery, namely:—

2. The use of pressure forceps—forcipressure, as it has been termed. I believe I was the first to replace the old “snip,” or “clip,” or “bulldog,” so easily lost in the abdomen, by larger instruments. Mr. Nunneley arranged for a more permanent occlusion of bleeding vessels by tubular forceps;

Köberlé and Péan contrived the “pinceaux hémostatiques,” which I now show in different shapes and sizes, as well as the smooth powerful nickelised instruments, which I prefer. They are here of various sizes, straight and bent at different angles. The smaller are useful in almost any surgical operation, for the temporary stopping of bleeding before ligature, for torsion, or for the suppression of bleeding permanently by crushing together the coats of the bleeding vessels. The larger ones are very useful as means of making an operation almost bloodless—a sort of substitute for Esmarch's bandage, or the elastic ligature where these cannot be applied. I have found them especially useful when removing uterine tumours. They may be applied as temporary clamps before amputating the growth; and, after this has been cut away, they may be removed one after the other, and all bleeding vessels at once secured by ligature. This may appear to be a little thing, but it stands for much in the sum of daily surgery; it comes in to aid at every moment, and is of almost universal application.

3. The question of antiseptics and drainage is one of far greater difficulty. On the general question of antiseptic surgery I must not enter. Another day, in this section, is specially devoted to this great subject. But the question of drainage, in relation to antiseptics in abdominal surgery, is so curious that I must devote a few minutes to it before concluding. What appears to me so remarkable is, that, while in general antiseptic surgery drainage is so very essential—is, indeed, a fundamental part of the system—in my own experience of ovariectomy, and of the removal of uterine tumours, antiseptics have abolished drainage. I have not even used a drainage-tube for more than three years. Formerly, in cases where much fluid was likely to collect in the abdominal cavity after operation, drainage was necessary. If the fluid did not escape, it putrefied, and poisoned the patient: or had to be removed by puncture, or by reopening part of the wound. Since adopting antiseptic precautions, either fluids do not form—or, if they do, they do not putrefy—and they are absorbed without doing any harm, without leading even to any febrile rise of temperature. I do not say that I have not seen one or two fatal cases, where it might have been better if I had drained—or that, in one or two, part of the wound has not reopened, and permitted the escape of some fluid—but, I do repeat, I have not used a drainage-tube for more than three years; and my present feeling is that the case must be very exceptional indeed in which I shall venture to use one. I trust we shall hear from Mr. Thornton and others who have more experience of drainage than I have, what they learned from this practice. Professional opinion on this point has still to be settled; but I think forcipressure may be accepted as unreservedly as union of peritoneal surfaces in all cases of removal of abdominal tumours; and I feel sure that, by careful attention to all needful antiseptic precautions, these operations may now be undertaken with a far more confident expectation of a successful result, than could have been reasonably entertained a very few years ago.

REMARKS ON SOME RECENT AND PRESENT VIEWS REGARDING FEVER IN INDIA.

By Surgeon-General C. A. GORDON, M.D.,
C.B., Q.H.P., &c.

IN 1859 the first allusion in published reports occurs to *typhoid fever* as a specific disease affecting British troops in India. It was stated (a) that towards the later part of that year a *typhoid* form of *autumnal fever* prevailed among those stationed at Deesa; that “it might reasonably enough be supposed that no difficulty could be experienced in classifying, the cases so recorded, under the head of *remittent fever*, from the fact of their occurring in India during the autumn months, as well as from the circumstance that numerous cases of *intermittent* and *remittent fever* were recorded in the regiment at the same time. . . . Moreover, it cannot be denied that some of the symptoms were, of a kind, to lend support to this view; for example, occasional remissions, particularly in the early stages.” In the first case recorded in detail, “the large intestine was free from indications of disease, but there was a sub-mucous melanotic patch at one part of the canal, and the calibre of the lower part of the intestine was contracted. In a second case, the mucous

membrane, in the upper part of the cæcum, was softened, and of a pink colour; there was enlargement of some solitary glands and mucous follicles, with here and there points of incipient ulceration." In the third, "the mucous membrane of the cæcum, and part of the ascending colon, was the seat of several ulcers or gangrene spots, but of less size; the glands and follicles dilated with cheesy matter, passing at several points into ulceration; a dark inky fluid filled the whole tract of the large intestine." In a fourth, "a large ulcer was observed in the cæcum, and several ulcers at the junction of the cæcum and colon." In a fifth, "a very sloughy state of cæcal and colic valves was noticed; from this point the mucous membrane of the cæcum and colon was covered throughout their entire extent with a semi-coagulated layer of dark venous blood, though the membrane itself bore no traces of inflammation." In the sixth, "the mucous membrane of the large intestine bore traces of inflammation, but no ulcers were found on it." These cases, and the type of disease represented by them, prevailed chiefly among young and unseasoned men."

The comments upon these cases made by the treating medical officer at the time of their occurrence, not only help us in arriving at an approximate estimate of their causation and nature, but throw light upon inquiries subsequently made. He states that the cases began as remittents; that their symptoms rapidly became *adynamic*; that the attacks occurred in autumn, but that the post-mortem appearances were different from those of remittent fever, and of a kind to identify the disease so far with typhoid fever; the morbid changes alluded to being observed in the lower third of the ilium. Other circumstances seemed to connect the disease with *typhoid* fever. These were the occurrence of hæmorrhage, mælena, the absence of attempt to repair diseased structures, the youth of most of the patients, red tongue, nature of dejections, occasional diarrhœa, slight gurgling, and iliac pain on pressure, and the impotency of quinine. It is specially noticed that the *specific* lenticular rose-coloured eruption of *typhoid* was not observed in any of these cases; the medical officer makes the remark that the cases occurring at a season of the year, when *prickly heat* mostly prevails, it would be difficult to recognise the *specific* eruption with certainty. With reference to the etiology of the cases in question, he observes that the troops were overcrowded in barracks, and thus the air of their dwellings rooms contaminated, but that the barrack ranges were badly arranged, and too near each other, preventing sufficiently good ventilation; also that they were exposed to emanations from latrines and cesspools, and that although the temperature of the atmosphere was exceptionally high, its dryness was greater than usual. Dysentery was comparatively rare, but, in other respects, the year was an unhealthy one; also that in some cases the *specific* lesions existed without fever. So far as the records of the cases go, they indicate hæmorrhagic dysentery, such as medical officers in former years were familiar with among troops in overcrowded barracks in India; and in the instance related the circumstance appears that 1,060 men occupied accommodation for only 800. The post-mortem appearances in the several cases vary, and certainly there appears nothing in the history of the cases given to indicate anything more *specific* in their nature than that they were mainly the result of endemic and climatic influences affecting young men somewhat crowded together.

In 1862 the late Inspector-General Macpherson, of the Madras Service, published a series of reports on Hill and Marine Sanitaria. Adverting to the subject of fever in reference to these he says, "It is an arbitrary style of reasoning to advocate, as is usually done, that there is a certain 'fever range' in all mountain ranges in India, beyond which the *specific* morbid influence cannot ascend;" "primary cases of intermittent fever are by no means uncommon at Simla," 8,000 feet above the sea, and its latitude 33", as also with the worst form of *typhoid remittent*. Dr. Aitkin, on duty at Ootacamund,

records the occurrence at that station of *very* severe cases of *jungle fever* originating in the place itself. Dr. Heyne alluded to the circumstance that hills on which fever was found to prevail with greatest intensity are those composed of granitic rock; also that "malaria" becomes so diluted or changed by the effects of elevation, cold, and moisture as to cause bowel disorders instead of intermittent fever; that this circumstance with others makes diarrhœa the prevailing disease in hill ranges generally.

In these remarks we find represented exactly the views held by the older Indian medical officers, and a comparison of them with those expressed with regard to the cases at Deesa will probably indicate the points wherein lies the difference between those views and the modern—that difference being that whereas formerly the phenomena presented were looked upon as the results of endemic and climatic influences they have of late years been held to constitute a *specific* disease, the result of *specific* causes; also that, whereas formerly, the term *typhoid* was intended to express merely a *condition* occurring in the course of fever of whatever type, it is of late years intended to imply a *specific* form of fever, the result of certain assumed *specific* causes.

In 1860 a destructive contagious fever appeared in the central jail at Agra. It again prevailed in very deadly form in the same jail in 1864, as also in Etah. In 1865 it appeared in the jails of Umballah, Futehghur, Allyghur, Jeypore, Malwa, &c. It was described by the several reporters on it as true typhus, contagious fever, typhoid fever, and some believed it to be identical with the relapsing fever of Europe. The circumstance which is valuable with reference to our present purpose is that the fever in question was variously designated by capable men whose duty it was to investigate the several outbreaks of it.

In 1864 some illustrative cases of what was then looked upon as *specific enteric fever* were published. (a) The cases referred to occurred at Secunderabad, and were as follows, namely:—

1. M. H—, æt. 23, in India four years, admitted with intermittent fever; soon afterwards diarrhœa supervened, the fever subsided, the hæmorrhage recurred; then diarrhœa persisted; pain in the right iliac fossa; rose spots on abdomen. Treated first with quinine; then sulphate of copper, nitrate of lead, and opium; then quinine again. At the end of about a fortnight blood in large quantities was passed, turpentine was given, the hæmorrhage, however, recurred, and in two or three days afterwards the patient died. Post-mortem examination revealed ulceration in the lower part of the ilium, not extending beyond the ileo-cæcal valve, mesenteric glands enlarged; the site of the hæmorrhage unstatic.

In connection with the history of this case there is no record of exposure to *specific* causes of a *specific* fever other than such as was climatic and endemic; the term *enteric* therefore has reference to the fact of disease existing in the small intestine, and occurring as a *complication* in the course of endemic fever.

2. M. W—, æt. 21, in India three years, admitted 4th September, 1864, suffering from the ordinary symptoms of dysentery. Had *ipecacuanha* in large doses; suffered from intense pain in the region of the cæcum.

October 2nd.—Passed a pint of pure blood.

3rd.—More blood; astringent enemata given.

4th.—"The characteristic spots" appeared.

5th.—Large shreds of mucous membrane passed.

17th.—Passed some inches of mucous membrane.

26th.—The patient died.

Post-mortem examination revealed two large perforations in the colon, and one in the ilium; general peritonitis; intestines adherent; colon ulcerated; some twelve inches of its mucous membrane sloughed and voided.

In this case the indications are those of gangrenous dysentery; and the circumstance is notable that the nature of the disease present was, in the first instance,

(a) In the "Departmental Blue Book."

designated as dysentery. If, as it may fairly be assumed, the occurrence of "spots," considered "characteristic" of specific enteric fever, was looked upon as furnishing grounds for the affection present being so designated, then the circumstance seems to have been unacknowledged that an eruption of similar or undistinguishable nature occurred *also* in the course of malarious dysentery. The case is one in which failure attended the use of *ipecacuanha* in "heroic" doses.

3. P. C., *æt.* 28, seven years' service; period in India unrecorded; admitted 28th October with ordinary symptoms of acute dysentery. Had large doses of *ipecacuanha*, and these subsided.

November 4th.—Abdomen tympanitic; face haggard; evacuations yellow, and mixed with bran-like particles, without blood; deafness present; no eruption. In the evening of this date, evacuations streaked with blood; collapse progressing; delirium; death.

Post-mortem examination revealed extensive peritonitis; the entire extent of the large intestine in a state of spæcelus and ulcerated patches.

The subject of this case had been ill seven days before admission into hospital, and himself attributed his attack to having bathed in a tank. The circumstance was also stated in reference to it that no faults in the state of conservancy in and around barracks existed. The case itself was evidently one of severe dysentery, due to a very obvious cause; and like that preceding it, illustrating the non-efficiency of *ipecacuanha* administered in large doses.

(To be continued.)

A CASE OF INFLAMMATORY HYPERTROPHY OF THE SPLEEN, FOLLOWING AGUE, AND ASSOCIATED WITH PHELGEMASIA DOLENS.

By D. H. CULLIMORE, M.K.Q.C.P., F.R.C.S.I.,
Physician to the North-West London Hospital; Surgeon Indian Army (retired).

A. B., married, *æt.* 31, presented herself as an out-patient at the North-West London Hospital on the 22nd February, 1881. She was born at Newmarket in Cambridgeshire, and after close questioning and consultation with her mother, she clearly remembered having suffered from intermittent fever about twelve years ago. For the last six years she has resided in the Highgate district of London, which, as every body knows, is one of the highest and driest in the metropolis, yet the effects of the ague have not disappeared. Distinct rigors and violent exacerbations of fever she has never had, but slight flushes of heat and cold, accompanied with headache, have periodically given her considerable annoyance. Of ague or enlarged spleen she has never heard; the symptoms of the former she was led to believe were due to nervous debility, and the enlargement of the spleen, which first manifested itself, at least in any considerable size, about two years ago, was looked upon as a pleurisy, and treated with mustard fomentations and blisters, which gave rise to much irritation, but completely failed to relieve the dragging pain and depression of spirits from which she suffered.

At this time she was pregnant, so it is easy, unless the spleen was enormously enlarged, to understand the difficulty of arriving at a correct diagnosis. After delivery the swelling in the side subsided, nor did she feel any inconvenience on that account till she again became *enceinte*, when not only the pain and swelling in the left side, but also the flushes of heat and cold reappeared, and this time in a more aggravated form than during the previous pregnancy.

On her second accouchement four months ago, she felt better, the swelling having greatly diminished, but during the last two months, though she is not pregnant, all her symptoms have been making rapid progress. I should have stated that after each confinement she suffered from

phlegmasia dolens, which however passed away in a couple of months, leaving a slightly œdematous condition of the lower part of the leg.

State on first Appearance.—On examination the spleen was found to extend on the right side, well beyond the linea alba, backward to the spine, and downwards to within two inches of the crest of the ilium. The tumour was resilient, uneven, at least not smooth like some ague cakes I have seen, and more prominent just below the ribs. It was attended with pain, heaviness, and respiratory distress, the latter at times so urgent as to cause orthopnea and sleeplessness. There was no hepatic enlargement, no signs of pleuritis, and no cough. The temperature was normal, and the pulse about 70, soft and small; while the skin was clammy and cold, resembling the condition which all who have been to India know to be normal in the native of that country. Her countenance was yellowish pale, and she looked anæmic and considerably emaciated. The skin beneath the eyes was almost black—distinctly darker than one is accustomed to see in cases of exhausting disease.

The urine was highly coloured, loaded with lithates, but contained no albumen. There was nausea, vomiting, anorexia, and sleeplessness. She is of a dark complexion, which I merely mention, as I remember to have seen it stated, where I cannot at present remember, that phlegmasia dolens occurs more frequently in dark than in fair women. There was also slight cardiac palpitation.

Treatment.—Ung. hyd. biniodidi, $\mathfrak{z}\text{ij}$.
A small portion to be rubbed well in twice a day, and to be intermitted when the local irritation became excessive.

R Acid nit. dilut., $\mathfrak{M}\text{vij}$;
Liq. arsenicalis, $\mathfrak{M}\frac{1}{2}$;
Tr. belladon., $\mathfrak{M}\text{v}$;
Acid hydrocyanic, dil., $\mathfrak{M}\text{ij}$;
Infus. cichon., $\mathfrak{z}\text{ij}$.

Mft haustus. Ter in die.

March 1st.—Has used the ointment continuously during the past week, with the result that the spleen has decreased fully one-half in size, and her comfort had in a direct ratio increased. She eats, sleeps, and breathes easier; and has to some extent lost her look of distress and fatigue; urine, high coloured. Had a mild attack of fever during the week.

R Liq. arsenicalis, $\mathfrak{U}\text{xv}$. (gr. $\frac{1}{2}$);
Potassæ bicarb., gr. xv;
Nit. potassæ, gr. v;
Tr. nux vom., $\mathfrak{M}\text{j}$;
Aqua, $\mathfrak{z}\text{j}$. Bis in die.

16th.—Wonderfully improved, has had no returns of the heat and chills; the spleen rapidly decreasing in size; appetite fair; urine normal. Omit the arsenic, continue the ointment at intervals.

R Tinct. ferri mur., $\mathfrak{M}\text{x}$;
Sulph. quinæ, gr. ij;
Aqua, ad $\mathfrak{z}\text{j}$. Ter in die.

April 5th.—Splenic enlargement with attendant uneasiness almost gone. General health fair.

Continue iron and quinine.

12th.—Repeat mist et ult. Is cured, or at least sufficiently well to cease attendance for the present, though I expect she will return with a renewal of her trouble, if not before, at all events when she again becomes pregnant.

Remarks.—This case is worthy of remark in many particulars: First it shows that malarial poison sufficiently potent to be dangerously effective after many years residence in a district healthy as regards ague, still exists in England. Secondly, so great an enlargement of the spleen is rare in this country, and when it does occur, is perhaps more likely to be due to, or connected with, leucocythæmia than depending on malarial fever. Leucocythæmia is a disease, *sui generis*, which derives its name from an increase in the white corpuscles of the blood, and is simultaneously accompanied by a diminution of the red. And in this case the complication of phlegmasia dolens—an affection depending on an inflammatory blockage or obstruction of the lymphatics and veins, might

lead us to think that the splenic enlargement was due to leucocythæmia, did not the distinct history of malarial origin contradict such a view.

Moreover, the splenic disorder preceded in point of time any symptoms that might be looked upon as indicative of leucocythæmia; nevertheless, some of these symptoms were so well marked in the case under consideration that the existence in its initiatory stage of this disease cannot be left out of sight. For example, leucocythæmia according to Paterson, Vidal, and Virchow begins, or first actively manifests itself during pregnancy. It also most frequently makes its appearance between the ages of 30 and 40, is generally associated with splenic or lymphatic derangement, and attended with dyspnoea out of all proportion to the elevation of the diaphragm. Nausea, paleness, general ill-health, flying pains, vomiting, and a tendency to anasarca are its prominent accompaniments. Now, as all these were present in this case, it appears to me that the sequence of events might be explained in the following manner.

First, the malarial fever was the original cause of the enlarged spleen which at first decreased in size on the cessation of pregnancy, and was thus temporarily relieved in some vicarious manner, by the onset at this period of the phlegmasia dolens, only however, to assume its more than original size on the departure of the latter affection. And as the symptoms of leucocythæmia increased, *pari passu*, with the growth of the spleen, it is reasonable to contend that they were either caused by the destruction of the red cells or the more active manufacture of the white in the extended interior of this organ.

Again looking upon the sequence of events in this connection, as from the birthplace of the patient in a malarial district, we can hardly avoid—this case presents some anomalies, 1st, because men are more subject to malarial fever than women; and 2ndly, and of greater importance from the fact that a certain immunity has been claimed for puerperal women. Thus Quadrat states that during an epidemic at Prague he only saw two cases among 8,639 pregnant women, which Ritter attempts to explain, not on the ground of any special immunity as regards ague, but from the fact that women are less liable to contract any disease during the last four months of pregnancy.

With regard to the enormous size the spleen had attained, how are we to explain it somewhat rapid subsidence? (about a month.) Its size could not be due to any temporary increase of blood into the organ during a chill, for there was no fever to speak of, and its progress was slow.

It is more likely the enlargement was caused by hypertrophy the result of pigmentary deposit, associated with hyperplastic conditions and proliferation of the adenoid tissue, originating in the continued paralyzing effect of the poison on the vaso motor nerves leading to hyperæmia, or more probably, as I hinted before, to its destructive action on the red corpuscles of the blood itself. However produced, the complete subsidence of this chronic condition, even under the influence of drugs, is noteworthy, and may be compared to a case mentioned by Abercrombie, when "an enormously hypertrophied spleen vanished in a week on the cessation of the fever that produced it," for here the size of the organ was obviously augmented by an overflow of blood, and differs from my case where the fever was slight and generally absent.

With reference to the view that fever is sometimes intensified by abnormal splenic development; a view which in these days of surgical perfection might, in obstinate cases of fever lead to its extirpation, I may state that in Ziemssen's "Cyclopædia," there is a case recorded where a man received a wound in the abdomen, through which the spleen escaped, which as it could not be returned was removed, with the result that fever was permanent afterwards, and that notwithstanding the post-mortem disclosed but a rudimentary organ.

One word on the drug treatment and I have done.

This was a case which from its chronic character arsenic was thought more beneficial than quinine, and though the drug was withheld in any useful dose, for a week, on account of the nausea, &c., yet under the local remedy the progress in subsidence was more rapid than at any subsequent period, which is explainable on the ground that more recent alterations admit of more rapid dispersion. As to the dose of arsenic in chronic ague, my experience is that the pharmacopœial dose of 2 to 8 minims is far too small, 15 minims of Fowler's solution, or $\frac{1}{2}$ grain of arsenic, being often a necessary dose. Bouden gives 1-9th grain, and recommends a larger dose in warm than in cold weather. Having found difficulty in giving large doses in some cases when the stomach was out of order, and looking upon such doses as most effectual, I was induced to look into homœopathic literature to see how they managed such cases, and was surprised to find that their best authorities speak of their treatment of ague in the following terms, viz., "My own experience in ague is the experience of nineteen out of every twenty in our school, and so thoroughly is this matter understood, that it has become proverbial in malarial districts that homœopathic physicians cannot cure ague. Many persons, ardent homœopaths, will resort to quinine, or to an allopath, rather than take the chance of a run of the disease for several days, and resort to it in the end." Arsenic might, I dare say, in such cases be given hypodermically, but I have no experience of it.

As to the prognosis in this case, I should not be surprised if all the symptoms return with pregnancy, and probably before, when if the patient will submit, and again comes under my observation, I will try and obtain some of the blood for examination.

FOURTEEN MONTHS IN CANADA FROM A MEDICAL POINT OF VIEW.

By A. W. WALLACE, M.D. Edin.,
Parsonstown, King's Co.

If the writer may judge of the acquaintance of others with Canada from his own before going there, it must be pretty much a *terra incognita* to most. A few jottings, medical and otherwise, and sketches of what he saw may not, therefore, be uninteresting.

Hamilton, where the writer resided during his stay in Canada, is a city of 36,000 inhabitants, situated on a raised beach at the head of Lake Ontario. The tableland of Ontario terminates abruptly in a precipice about 300 feet high, about two miles from the edge of the lake, leaving between it and the water this strip of raised beach, composed of sand or clay, and cut into gullies and gorges at various places by the summer torrents which fall from the precipice above. It descends by a gradual slope towards the lake from the base of the cliff, and terminates at the water's edge by a steep escarpment 20 to 30 feet high. The city is composed of streets and avenues at right angles to each other, having wooden side walks, and with rows of trees planted at each side. Many of the houses stand separate and have gardens and shrubberies, so that the city occupies a large area, being about three miles long and two broad. The houses are mostly built of brick in the centre part of the city, but in the outskirts wood is largely employed.

The water supply is taken from the lake at about five miles distance from the city, whence it is pumped into a reservoir on the cliff and delivered to the houses at a very high pressure and by direct service, no cisterns being employed. There are a number of surface wells also in use. The drainage is effected by sewers which deliver their contents unpurified into two or three inlets of the lake where there is no current, so that there are some very filthy spots quite adjacent to the town. The deaths for 1880 were 599, giving a ratio of 16.6 per 1,000, but of these deaths no less than 291 were of children under 5 years of age and 166 of children under one year. It is not easy to say to what

this high infant mortality is due. As will be shown further on, summer diarrhoea has, no doubt, a good deal to do with it, but it is also owing to a number of other preventable diseases. Scarlatina, typhoid and diphtheria (so called), are very prevalent, especially during winter. The disease last named is not, however, true diphtheria, being never followed by paralytic symptoms, nor indeed presenting the characteristic appearance of the throat, but is follicular tonsillitis, otherwise "sewer sore throat." It is very fatal from the extension of the aphthæ to the larynx.

There is a Public Health Committee of the Corporation with the usual results as to removal of refuse, inspection of unhealthy dwellings and the like. The site of the New Hospital has been fixed within a few hundred yards to leeward of one of the filthiest sewer outlets into the lake, and within an area in which ague is endemic.

The subsoil on which the city is built is a fine sand, several yards deep at most places, under which is a retentive blue clay. This natural arrangement affords a very convenient means of disposing of sewage from most of the private houses. A deep pit is dug and a house built over it as a privy. The privy contents soak away into the sand, so that there is no necessity for ever cleaning it out. There are hundreds of such in the city, and as the wells are all sunk in this same sand, it need hardly be said that the writer scrupulously abstained from drinking "well water" during his stay there. (a) During winter the whole surface of the ground is frozen to a depth of from two to four feet. The underground atmosphere is thus effectually cut off from the surface, except where a communication is formed by the basement of the houses, the heated air in which exercises a strong suction power, and draws the underground atmosphere into the house. It need be no cause of wonder that houses with basements are found to be unhealthy, and that zymotic diseases are most prevalent in winter and in houses with wells.

The writer was curious to observe the effect of the winter's cold on the health of the people. Chest affections became a little more prevalent, and a few more old people and young children than usual died. The deaths in January were 17 per 1,000, no more than the average for the year. The deaths for February could not be got separately; for the first four months of the year the rate was 16 per 1,000. The mean temperatures for January, February, and March, were 18°, 20°, and 30° respectively, and the minima for these months were 7·7°, 20·5° and 6·6°. In England during last February though a mean so low as 20° was only maintained for three or four days the mortality went up to 29 per 1,000 as the average of 20 large cities. The cause of this difference will be found in part in the exceeding dryness of the Canadian air, and consequent absence of fog and smoke, but chiefly in the absence of that class of the population on whom the evil effects of cold fall most heavily. It is rare to find people in Canada who are not well fed and clothed, and warmly housed. Indeed, the houses are often too warm, 75° and even 80° inside, with an outside temperature of 10° or 15°. Sudden changes of temperature do not seem at all so injurious as is commonly supposed. The warmer one is when leaving the house, the less the cold is felt. Of course the case is wholly different if one goes into the cold while the skin is damp with perspiration. Still less reason is there for believing that air can be too dry for health or comfort. The unpleasant effects ascribed to dryness of the air are really owing to the presence of fine particles of dust, small quantities of carbonic oxide or other impurities.

The season of "Spring" is characterised in Canada by brilliant sunshine melting the snow off the footways, high blue sky and sharp bracing air. The snow disappeared on

(a) Toronto is worse off than Hamilton in respect of water. The supply is ostensibly drawn from a considerable distance out in the lake, but the pipes pass through the part of the bay into which the sewage is discharged and being rather leaky at the joints the citizens are treated to a variety of visible animalculi in the water, not to say what bacilli and micrococci there may be besides. Belief in which last, however, has not possessed the medical mind there yet.

the 21st of April last; the trees began to leaf in the first week of May, and in less than a week from the opening of the first bud the country was covered with verdure. There is usually a "hot spell" in May, the temperature rising to 90° or 95° for a few days, but this is soon succeeded by cool weather, and the excessive heat does not begin till July. It then ranges 80° to 95° or even a 100° for some weeks. In July, 1880, the deaths were 77, in August 46. The deaths of children under one year were 33 and 17. The total deaths for these months were therefore 25·7 and 15·3 per 1,000, and the infant deaths were 43 per cent. and 15·3 per cent. of the total deaths. If the excess of infant deaths are deducted, the deaths for the two months are 19·7 and 14·7 respectively per 1,000, so that the increased mortality was almost wholly incident on the infants.

Medical practice in Canada occupies a midway position between that of Ireland and England. There are hardly any medical men who keep "open shop," the licensed pharmacists never prescribe, but keep "drug stores" where prescriptions are compounded, and patent medicines sold; these last forming an important branch of trade. Medical men have an office or surgery attached to their private house where they keep some drugs and give "advice and medicine" to the working classes for a dollar or 75 cents. The usual fee is a dollar a visit. Prescriptions are given to the wealthier classes. There are about 30 medical men in practice in Hamilton, two of whom are professed homœopaths. The first question put to a medical man usually is "Are you allopathic or homœopathic?"—a question requiring a cautious answer, as a current definition of the difference between the two *athies* is "Homœopaths give as little medicine as they can consistently with curing their patients, Allopaths give as much medicine as they can without killing their patients." As the writer found that the latter allegation was in a few cases not without a certain amount of foundation, his reply used to be "I practice rational medicine." Homœopathy is recognised in the Dominion as a separate entity, having its own examiners and giving a registerable diploma. No one can practice until he has registered his qualifications in the province in which he intends to reside, and the detective of the Medical Board is very active in hunting up unregistered practitioners.

A great effort was made lately to shut out practitioners from other countries from registration until they had passed an examination. A decision was given against the College of Ontario in a case of degrees from Great Britain and Ireland, and these can be registered on payment of the usual fee of ten dollars. The only public appointments for medical men are those of Coroner and Medical Officer of Health, the latter a sinecure. Nevertheless, the Dominion affords a fine field for any man who is in love with his work. Country practice is very hard and no old-country man should attempt that, but city practice is quite as easy as at home, and there are far fewer able men pressing with it.

THE annual rates of mortality last week in the principal large towns of the United Kingdom were—Plymouth 13, Dublin 15, Sunderland 16, Edinburgh 16, Bradford 17, Bristol 17, Norwich 18, Brighton 18, Leeds 19, Glasgow 19, Birmingham 20, London 20, Portsmouth 27, Oldham 20, Sheffield 22, Manchester 23, Salford 24, Liverpool 27, Newcastle-on-Tyne 27, Wolverhampton 29, Hull 31, Nottingham 31, and Leicester 37 per 1,000 of the population.

THE death-rate of Hastings during the past quarter was 15·14 per 1,000. This is very much lower than the rate during the same period in former years, the average for the last four years being 18·55 per 1,000; last year at this time it was 19·50. The percentage of deaths of children under one year to the total number of deaths is 21·25, and that of children under five years is 30·62.

Clinical Records.

ST. BARTHOLOMEW'S HOSPITAL.

A Case of Vaginismus from Vascular Caruncle, treated with the Ether Cautey.

Under the care of Dr. MATTHEWS DUNCAN.

Reported by Mr. SIDNEY DAVIES, B.A.

ANN B., *æt.* 52, was admitted into St. Bartholomew's Hospital on June 14th. She gave the following history:—She had been married twenty-seven years, and had never been pregnant. Her catamenia commenced at the age of eleven, and ceased at forty-five. For some years before the catamenia ceased, she found defæcation painful; but there was no pain at the catamenial period. About six or seven years before the menopause, difficulty began to be experienced in sexual connection with her husband; it soon became impossible, and they had kept apart till the present time. Soon after the catamenia ceased, she began to have a continual pain in the vulva, which she attributed to cold, and took no notice of it till a few weeks before, when she went to the Radcliffe Infirmary (in Commercial Road), and was examined under chloroform. She subsequently came to the out-patient department of this hospital, and was admitted by Dr. Godson. She had had no discharge or loss of blood. The bowels were confined. There was no trouble in urination. The pain was of a shooting character, and was experienced during the day time; it did not keep her awake at night.

On the day following admission, her temperature was normal, pulse 84, tongue clean, and general condition satisfactory. There was some tenderness above the pubes. Urine acid, 1030; no albumen, no sugar.

On June 16th she was examined by Dr. Matthews Duncan, with the following result:—

Per hypogastrium, nothing abnormal discovered. Per vaginam, nothing abnormal discovered.

The right nymphæ, about three times as large as the left, but healthy. The two posterior thirds of the urethral orifice slightly hypertrophied, and red as a bright caruncle.

Dr. Duncan freely burned this part with the ether cautey, a staff having first been inserted in the urethra.

Great pain was at first experienced after the operation, but gradually diminished, and the patient was discharged cured on July 7th.

A Case of Parametritis, with a Remote Abscess—Recovery.

HARRIET C., *æt.* 24, mantle maker, was admitted into St. Bartholomew's Hospital on April 27th.

The patient had been married twelve years, and had two children, the last one of which was born three months ago; she had had no miscarriages.

The main points in the history of her illness were as follows:—Two days after her last confinement she had had a severe rigor; she made, however, a fair recovery, and got up from her bed two weeks after the confinement. One week, after rising, she got wet, and took cold while washing clothes; this brought on pain in the left side, and weakness of the left leg, but she was able to get about till a month before her admission. Since then she had been a good deal confined to bed, and been troubled with night sweats, coming on after the "first sleep." She had also suffered from diarrhoea, and severe pains in the back and leg, especially during the last month.

Present condition.—Tongue slightly furred, bowels pretty regular; sleeps well; appetite good. Evening temperature 101.0.

Physical signs.—There is a fulness and fluctuation in the left iliac fossa, extending to four or five inches below Poupart's ligament, and also on the outer part of the

leg. There is also some tenderness over the left lumbar region.

The patient continued in the same condition for a week. Her morning temperature was about 99.0, and evening, 100 to 103; pulse 100.

The following notes were taken from that time:—

May 8th.—Pulse 108; temp. 99.2. Tongue rather furred; bowels open. Patient complains of much pain in the head, abdomen, and left iliac region; the latter being persistent. Dr. Matthews Duncan examined her, and found increased fulness and tenderness on the outer side of the thigh.

9th.—Dr. Duncan again examined the patient, and reported fulness above Poupart's ligament, especially at its inner part, but this fulness is slightly resonant. Per vaginam.—Bimanual examination discovers some mobility of the uterus, but between the left foramen ovale and the uterus there is a hard swelling, which is somewhat movable. No continuity can be traced between the pelvic tumour and the abscess in the middle of the thigh.

11th.—Abscess opened on outer side of thigh, with antiseptic precautions; about 6 ozs. of pus withdrawn.

12th.—Abscess dressed; it is still discharging.

Patient slept well, and has no pain. Temp. 97.

19th.—Temp. 97.8; abscess nearly healed.

31st.—Parts around the incision very tender. There is a hard swelling in the left groin extending below Poupart's ligament. The skin over this, and extending down to the incision, is very pale. The thigh is painful. Temp. 99.5; pulse 120.

June 2nd.—Dr. Duncan examined per vaginam. Uterus fixed and flexed to the left side; cervix immovable.

4th.—Abscess discharging more, and more tender.

7th.—The night before last, patient began to feel unwell, with pain in the leg; had "shiverings" all yesterday. Temp. last night, 103.4. This morning, temp. 101.0; pulse 125. Leg is very tender, and much swollen on the outer side; the swelling is hot, and gives indistinct fluctuation. Incision looks healthy. Cannot lie on her left side, as requested, because of the pain. Pains in groin and left knee.

9th.—Patient looking worse; face flushed; temp. 103.6; pulse 132. Leg very painful and tender. Dr. Duncan's note.—Tenderness has appeared above the left Poupart's ligament, with some induration, but there is no notable increase of dulness on percussion. Per vaginam.—On palpating deeply, the finger reaches some induration in the region of the left inguinal canal.

11th.—Thigh is much less tender, and the swelling is harder, and more limited. The hardness in groin the same. Temp. last night 100; pulse 96.

16th.—Temp. sub-normal.

21st.—Incision healed; swelling in thigh gone, and no tenderness.

The patient went out cured about a week after.

Remarks.—The interesting features in this case are (1) the occurrence of what Dr. Duncan calls a "remote abscess," i.e., suppuration occurring at a point in the thigh, unconnected by suppurating tissue with the groin; (2) the almost complete disappearance of the phlegmon in the pelvis, and fixing of the cervix at the place where it had been situated; (3) the complete recovery of the patient under the simple treatment of rest in bed, poultices and tonics.

MEATH HOSPITAL AND COUNTY DUBLIN INFIRMARY.

Case of Dry Gangrene.

Under the care of PROFESSOR RAWDON MACNAMARA, M.D., F.R.C.S.I.

Reported by Mr. FRANK CAMPBELL.

PATRICK KENNY, *æt.* 26, a native of County Wicklow, was admitted into the Meath Hospital on the 10th August,

under the care of Mr. Macnamara, suffering from dry gangrene of left forearm.

History.—He stated that on the 1st November, 1880, he was driving a horse under an outside car, and on descending a hill the horse fell, he being thrown to the ground; in order to break the fall, he put out his hands, and in so doing he sustained a compound fracture of the radius and ulna, in the middle third. Having been taken to the County Infirmary, the surgeon set the fracture, applying splints and bandages, and retained him in the Infirmary. On the third day after the accident, he noticed that the shoulder and arm had become greatly swollen, accompanied with great pain. The surgeon having examined it, asked his consent to allow amputation of the forearm to be performed; he refused to give his permission, and left the Infirmary. On returning home he was advised by some persons to go to a bone-setter in Athy, County Kildare. This he did, and on the bone-setter seeing his arm, he informed him that if he put himself under his care, he would have his arm right again in less than a month, his terms being one guinea a visit. Having placed himself under his care, the bone-setter encased the whole arm, from fingers to the shoulder, in leather, so as none of the arm could be seen, and told him that he might now return to his home, and to come to him again in a week's time. From November to the day before he was admitted into the Meath Hospital, he had visited the bone-setter every week, and each week he told him that all was going on well, and never, during the whole time, did he remove the case which he had placed on the arm on the first visit in November. During all this time the poor man had paid the bone-setter over £15 in fees. On the 10th of August he came to the Meath Hospital. Mr. Macnamara having seen the patient, proceeded to remove the case. On its being removed, it was found that the whole of the forearm was in a state of dry gangrene, and that spontaneous amputation had taken place through the elbow-joint, the arm and forearm being kept together solely by the leather case. The stump which nature had thus made, was one of the most perfect that could be seen; it was very nearly healed, except a spot about one inch long, and a quarter inch wide, which very soon healed on the proper dressings being applied. The forearm was black, dry, and shrivelled, resembling closely the appearance presented by that of a mummy. The patient, nevertheless, in every other respect, seemed to be in rude health.

Department of Lunacy.

THE HEREFORD COUNTY ASYLUM.

A SOMEWHAT unusual feature is presented in the Annual Report of the Hereford County Asylum, viz., a defence by the reverend chaplain of that institution of *Bombastes Furioso*, and some other dramatic trifle which is not named, but which is described as "a light pretty little sort of thing," the descriptive phraseology being a quotation from *Corney Grain*, evidently picked up during some clerical violation of *St. George's Hall*. It appears that the chaplain of the Asylum, in addition to his strictly clerical duties, kindly undertakes to cater for the amusement of the inmates, and thereby usefully assists the medical officers in conducting moral treatment. In carrying out this self-imposed task he last year arranged for the performance of a play, which gave offence to somebody, and he speedily found himself arraigned before the Quarter Sessions of the county by an influential magistrate for having pandered to a corrupted taste and demoralised the pauper lunatics. His defence is contained in the Annual Report of the Asylum, which we have just received, and may be pronounced satisfactory. Just two plays were acted under his auspices and direction. One was "that inimitable burlesque, *Bombastes Furioso*, which even *Sancho Panza* himself would lack inspiration to run a tilt at;" and the other was a light and airy comedietta, which was so essentially tame that it

required to be "seasoned slightly" in the final tableau, and which was performed before "the simple little boys and girls at the workhouse with no ill effects." We congratulate the Rev. Mr. Bulwer on his spirited rejoinder to the *Bombastes Furioso* of the Hereford Bench; but we should recommend him, considering the state of feeling at Quarter Sessions on the subject, not to think of offering an engagement at the Hereford Asylum Theatre to *Sarah Bernhardt*, nor to attempt the production of *Les Dames Aux Camelias* for his next Christmas entertainment.

THE LINCOLN LUNATIC HOSPITAL.

THE Lincoln Lunatic Hospital has accommodation for eighty patients; but it contained at the close of last year only fifty-six, so that there remained twenty-four vacant beds, a fact which is only attributable to ignorance on the part of the medical profession and the public of the excellent character of the accommodation it affords to patients who can only pay small rates of board. The Commissioners in Lunacy, who inspected the establishment twice last year—registered lunatic hospitals being now subjected to the same amount of visitation as private asylums—speak in commendatory terms of its condition and management. The dietary is good, and ample provision is made for entertainment and exercise. New furniture and decorations have been recently introduced into the wards, and new ball-rooms are now in process of construction.

THE COUNTY ASYLUM AT LANCASTER.

THE County Asylum at Lancaster contained, on the 31st of December last, 1,117 patients, 566 men, and 551 women. The total number under treatment during 1880 was 1,462, and the rate of recovery for that year was 39.06 per cent. of the admissions, and the death-rate, 9.26 per cent. of the average number resident. The mortality seems to have been due to the census, which the usual figure in lunatic asylum reports is about the usual proportions. General paralysis alone was fatal in 24 cases, and with complications in 5 others. Epilepsy caused 7 deaths, pneumonia 11, phthisis 8, and gangrene of the lungs 2; dysentery and diarrhoea was responsible for 12, out of a total of 100 deaths, and erysipelas was the assigned cause of 2. This large mortality from dysentery, diarrhoea, and erysipelas, should lead to a searching investigation into the sanitary condition of the hospital, and especially into its sewage arrangements, water supply, and system of ward cleaning. Such an investigation should be undertaken by the Commissioners in Lunacy, who are the recognised guardians, not only of the liberty, but of the health of the insane poor, and it seems very desirable that one member of the Board of Commissioners should always have special and commanding qualifications in all the branches of State Medicine. Four inquests were held at the County Asylum at Lancaster during 1880; one in a case of fracture of the skull, caused by a fall from a window, one in a case of suicide by hanging, and two in cases of fractured ribs. Two births in the Asylum were recorded. In one case both father and mother were epileptic, and the former, soon after the birth of the infant in the Asylum, murdered his niece, a child six years old, and was, therefore, probably insane as well as epileptic, although his insanity had not been officially recognised like that of the mother. In the other infant born, there were indications of syphilitic disease, and the infant soon died. On the subject of the causes of insanity, Dr. Cassidy, the medical superintendent of the Asylum, says that he feels himself more and more impressed, with the effects of inherited pro-

clivity, the more minutely the circumstances and histories of individual cases are inquired into. There are few cases of mental disease, he is inclined to think, in which inherited tendency to the *insanis* or *neuroses* does not play a part.

Special.

NURSING: PAST, PRESENT, AND FUTURE.

At a time like the present, when nurses and their doings figure in the newspapers in such an unpleasant manner—that is, in their relation to coroner's inquests, it may not be either uninteresting or unprofitable to glance for a moment at the growth of nursing as an art, and to trace the changes which have taken place since the days when the genus Gamp reigned supreme; up to the present time when its place has been taken by another race, that which is associated with the honoured name of Florence Nightingale. It is not a comfortable reflection to look back upon when we remember the class of women who were chosen a few years ago to nurse the sick, women in most cases long past the prime of life, and whose chief recommendation was apparently, that they would not "take" any thing from the patient, that is, they would not suffer by their being in constant attendance upon the sick, so far as "taking" in the ordinary acceptation of the word is concerned, it were best perhaps to say nothing; for who has not heard of countless instances of "peculiarities" on the part of the old sick nurse which bear out only too truly the facts related in the life of Mrs. Gamp and the sisterhood of which she was a type. The sick-nurse of bygone days was ignorant and uneducated, she had neither the will to observe symptoms nor the power of appreciating what she saw, and her efforts to assist her patients were only too often merely so much assistance on his or her downward course; her object was, it is to be feared in many cases, not to lend her aid in bringing about a favourable result, but rather to make what she could out of the case. Inured to scenes of misery and pain, surrounded only by friends and relatives whose perceptions were dulled by the mental torture they were suffering; her incapacity passed unnoticed, her want of sympathy unfelt, save by the one who stood most in need or it—the patient.

So much for the past era of nursing; now let us look at the present, what have we got to supply the place of this, happily, extinct race?

After the glorious example set by Florence Nightingale a light dawned upon the women of England; ladies began to realise the fact that it was possible for a gentlwoman to earn her living by becoming a nurse, and a class of nurses arose who underwent a thorough training in that hitherto neglected field—the hospital. Women of all grades were trained and became good nurses; and the medical profession began to recognise in the trained nurse a powerful ally who was able and willing to assist them in carrying out treatment, and who could be trusted to watch and note the progress of their cases. What a vast stride had been made; valuable assistance had been obtained from a source from which a short time back help would have been worse than hindrance. But matters did not rest here; reform moved on with sure and rapid strides; it became the custom to teach nurses the rudiments of anatomy and physiology in order, as it was said, that they might be the better able to appreciate the various phenomena they were called upon to witness. Medicine and surgery followed in due course, until at the present time every nurse who is trained in an hospital has to go through a systematic

course of instruction in these subjects before she can obtain her certificate of efficiency.

Truly a wonderful change, and one which is (or should be) fraught with the greatest blessing to suffering humanity. Then why is it that we so frequently see in the newspapers death from neglect, deaths from inhumanity taking place, not in the houses of the poor, where one might reasonably suppose that such cases might occur, but in connection with our great hospitals, places which ought to be perfect so far as their power of preventing such occurrences as these are concerned; places where there are constantly one or more medical men on the premises, and whose wards are nursed by educated and trained women, why is it that these melancholy scandals arise? How is it that, with such a perfect system of working (and we are asked to believe that these systems are perfect, though the outcome scarcely seems to be of such a nature as to warrant the request) and with the most eminent medical men of the age employed daily in attending to the sufferings of the patients, with a resident staff of "dressers and clerks," whose duty it is to carry out treatment and in many cases to note the hourly progress of the sufferers, and in addition to all this, with a staff of trained nurses constantly in attendance. Surely, with such a host of precautionary measures adopted there can be no room for error, yet that there is, is only too clearly proved by the late unfortunate case at Guy's Hospital. It is a most deplorable fact that in a civilised country it is possible for such things to happen in connection with our medical charities.

To whom are we to look for an explanation of these most undesirable occurrences? Where must the alteration be made to prevent their repetition? What steps must be taken to protect our suffering brothers and sisters from such an untimely end as befel the poor woman at Guy's last year? After all the bitter controversy which took place anent this unhappy case, when men of the highest reputation in the medical world threw aside their professional reserve and joined in a pen and ink warfare with lay-governors and with nurses, the outcome of which might be fitly represented by the figure 0. It is a delicate matter to say at whose door the fault should be laid. Still, although it may seem to be like stirring up muddy water let us make an attempt.

It was only too plainly manifest from the tone which was adopted by either side, both in the law court and in print, that there was an amount of tension existing between the parties concerned, which could only terminate in the defeat or destruction of some one. But how had this come about? What could have caused this estrangement between the doctors and the nurses. It is the old, old story, much would have more, the medical profession in welcoming the aid of the trained nurse and allowing her importance, acknowledged her value, and this encouraged her to undertake more and more. They allowed her greater liberty in the treatment of cases, and left many points of detail entirely in her charge, then gradually as a higher class of nurse appeared upon the scene she in her turn expected more liberty, and any one who has had the opportunity of reading the pages containing the life of Sister Dora will recollect to what a pitch this spirit of independence is wrought. In this book we are told of lives and limbs being saved by the courage and determination of the heroine, whilst acting against the express wish of the medical man under whom she was supposed to be working, not content with the mere routine duties of a nurse, this marvellous woman undertook responsibilities and incurred dangers, the account of which, even if it does not inspire the reader with admiration, will at least fill him or her with wonder that the heroine of such dauntless acts should have escaped either Divine recognition, or human punishment.

To this desire for more responsibility has been added a strange religious feeling, and hospitals have become in many instances fields for the scattering of the seeds of certain religious sects, attempts are made to attend temporal and spiritual wants at one and the same time, it was a rare opportunity for enthusiastic members of the various denominations to earn them favour in the eyes of the suffering, and enforce their convictions on all comers, this may be religion of one kind, but surely not that form which is known as the Christian religion. In many hospitals the work of attending on the sick has been made to suffer in order that the religious services may be properly (or improperly) carried out.

The minds of many good conscientious men revolted against the innovations, and there again was another element of dispute.

Thus it was that, the nursing community from being a docile submissive race, whose chief object was to do as they were told, gradually took up a new position as prominent authorities in the hospital, persons with whom it was necessary to consult before anything relating to the patients was done, and who had a two-fold object; first, the conversion of their patients to their own particular belief; and, secondly, to nurse the case, that is they place their religion first and expect all else to give way.

The fact that the spiritual welfare was their first consideration led to a firm opposition on the part of the medical staff, who (very naturally) said that hospitals were founded for the treatment of diseases of the body, and not for the advancement of any particular religious opinion, and as a result of this opposition they (the medical men) were accused of being atheists, for the simple reason that they would not tamely allow their honest conviction of what was their duty to be over-ruled by the sentimental extravagances of an enthusiastic sisterhood.

This then is the condition of things at present, this is the outcome of the high scientific training that nurses have undergone; all the time and patience which has been expended on their education has ended in rendering them incapable of appreciating their true position of nurses. They do not appear to be able to grasp the fact that their duty is to work under and with the doctor with whom they are associated and not to strike out an independent course of their own. This feeling of estrangement has not arisen suddenly, it is not the result of any great radical change in the constitution of nursing, those who know anything of the internal workings of a large hospital will tell you that all this degree of tension is the effect of a series of small grievances, so small, that in themselves they are not worthy of mention, but when viewed as a whole, assume a magnitude with which it is well nigh impossible to cope.

Let no one for a moment imagine that it is from any want of humanity on the part of the nurse, that these poor patients from time to time suffer, it is simply from the feeling on the part of the nurse that certain things are necessary, and she does them, not caring for the opinion of the doctor, whose authority she has been taught to disregard in such matters. In some instances (happily rare ones) the medical man is looked upon as a necessary evil, whose orders should be obeyed in so far as it seems good to the nurse, and no further.

If the evils arising from this state of affairs affected only the disputants, then the public voice would say, "let them fight it out, it is a matter of no importance;" but, unfortunately, this is not the case, a third person has a vital interest in the controversy—the patient—and it is when one of the latter class suffers, when a victim has been offered up on the altar of conceit and disobedience, when some poor creature,

whose life has been cut short, lying still in the marble majesty of death, appeals, with a silent eloquence which must touch the hearts of all, that the public feel how grave and how important is this most unfortunate dispute. That it must come to an end, sooner or later, is, of course evident. But how! and when? it is not easy to say, neither side seems inclined to give way; at one time it seemed likely that high legal authority would be called upon to interfere, but matters remain pretty much the same as they were twelve months ago. Let the heads of the nursing community carefully consider whether their demands are not excessive, whether they are not endeavouring to undertake too much responsibility, whether in striving for so much, they have not overlooked the fact that they are but nurses after all, and that although they are, in many ways, greatly to be admired for their self-denial and zeal, still that they run the risk of being looked upon as dangerous luxuries if they persist in their present line of conduct. Let us, then, hope that the day is not far distant when doctors and nurses shall once more work side by side in their noble occupation, when, irrespective of religious views, and unmindful of individual peculiarity, they shall concentrate their energies in the struggle against disease, when unity will take the place of disunion. Both sides remembering that the profession they have adopted is not an arena in which to fight out paltry jealousies, but common ground for the relief of their suffering fellow-creatures.

FRANCE.

[FROM OUR SPECIAL CORRESPONDENT.]

CHARGE OF PROCURING ABORTION AGAINST A MEDICAL MAN.—Last week a Dr. Choppard, residing at Montmartre, Paris, was arraigned before the Court of Assises of this city on the charge of producing abortion on one of his clients for criminal purposes. After a lengthy trial the accused was found guilty, and sentenced to five years' imprisonment, whilst his patient got two years. In the course of the trial, which attracted great interest in the medical world, the Public Prosecutor stated a fact which fully explains the decrease of the population of France. He told the jury that they should not forget that, according to reliable statistics, the depopulation of France is making frightful progress, and if it continues the country would soon fail in soldiers to defend it. "This depopulation is due to provoked abortions, which, is now become an almost recognised industry in France."

MENSTRUATING BY THE KIDNEYS.—An extraordinary case of a child menstruating regularly by the kidneys is reported by *Le Journal de Médecine*. A little girl of 8 years, a reputed hermaphrodite, otherwise enjoying good health, was observed to pass blood in her urine regularly every twenty-five days. The flux lasted four days, and then disappeared to return periodically. Albumen was found to exist in the liquid two days before each menstruation. After a few months the flux had become so abundant that the child succumbed. An autopsy was refused.

PARALYSIS OF THE ANAL SPHINCTERS.—The treatment of paralysis of the anal sphincter by subcutaneous injection of ergotine is affording good results. The most recent case in which this remedy was tried with success is that of a woman who, after confinement, suffered from incontinence of the fecal evacuations. Dr. Langer, who attended the case, having tried the usual means without success, had recourse to a solution of ergotine—viz., ergotine, 16 grains; cherry laurel water, 5½ drachms, of which he injected 1 gramme, or 16 drops. The first injection produced a noticeable amelioration, causing, however, great pain, which lasted an hour. Forty-eight hours afterwards he increased the injection, and the amelioration continued; the pain was also complete. After the fifth injection the cure was complete.

CAUDAL APPENDIX IN THE HUMAN BEING.—A military surgeon at Athens reports a case of caudal appendix in the human race. A young Greek in the regiment to which the

surgeon was attached was found to possess at the coccygean region an appendix measuring five centimetres. This appendix, rounded at its extremity, was not covered with hair, although at its junction with the sacrum there was an abundant growth. On examination, this caudal appendix was found to consist of two osseous portions, the upper continuous with, and firmly attached to, the sacrum, while the lower was independent and movable. Cases of this kind are so rare that it might almost be said that this is the only authentic case of caudal appendix containing osseous tissue. M. Virchow relates a case of a child who had one of these appendices seven centimetres in length which stirred when pricked with a pin. It was excised, and on examination no bony tissue could be discovered.

INSTANTANEOUS ASPHYXIATION.—Two Austrian chemists have succeeded in manufacturing a liquid which, when thrown on a person produces instantaneously a veritable asphyxiation. The person is rendered senseless. A trial of this terrible agent was made in the office of one of the leading journals of Vienna. One of the compositors, a man of herculean force, offered himself for the experiment. Hardly had he received a few drops of the liquid on his chest than he became as white as a sheet. He made desperate efforts to breathe, and the perspiration rolled down his face. He was on the point of falling, when the inventors made him breathe from a bottle an antidote. Instantly the man recovered himself. One can easily understand the sensation caused by this discovery as the number of crimes would enormously increase if it came to the knowledge of evil disposed persons. The Austrian Government is going to buy up the secret to use it in a military point of view, and also to prevent its being divulged.

In 1849 a French gentleman, named Poréant, left by will the sum of 80,000 dols. to the Paris Academy of Sciences to be awarded to the person who would discover the cause or nature of Asiatic cholera, or point out a remedy which would cure it in the immense majority of cases. A physician filed his claim to this prize in 1877, basing it upon the properties of the bromide of ammonium.

In the principal foreign cities the rates of mortality, according to the latest official weekly return, were in—Calcutta 23, Bombay 35, Madras 33; Paris 26; Brussels 26; Amsterdam 22, Rotterdam 20, The Hague 19; Copenhagen 17, Stockholm 15, Christiania 16; St. Petersburg 49; Berlin 44, Hamburg 28, Dresden 34, Breslau 43, Munich 38; Vienna 27; Prague 30; Buda-Pesth 40; Venice 28; Alexandria 41; New York 41, Brooklyn 31, Philadelphia, 28, and Baltimore 26 per 1,000 of the various populations.

In a recent issue of the *Philadelphia Medical Times*, Surgeon Sternberg, of the United States Army, relates that he had received a minute quantity of dried blood containing *bacillus anthracis*, which was sent by Professor Burdon Sanderson, with the statement that it was seven or eight years old, adding, "I have no doubt that you will find, if worked up with salt solution, and injected into a mouse, you will have the spleen, after from twenty-four to thirty-six hours, enlarged and infiltrated with bacillus." The material weighed about a sixth of a grain, and after being added to a little salt solution a few minims were injected beneath the skin of a mouse. In twenty-four hours the mouse was dead, and at the autopsy the spleen was found to contain the bacillus in considerable numbers, resembling exactly the bacillus of anthrax.

WEDNESDAY, AUGUST 31, 1881.

GUY'S HOSPITAL.

THE opportunity afforded by the lengthened silence generally observed by all legitimate censors of that series of blunders whereby Guy's Hospital achieved such miserable fame has been so entirely neglected by the responsible author of these errors of commission, that any further kindness of the same description would be altogether out of place. For a long number of months now the internal management of Guy's has been of a nature to provoke the strong condemnation from all cognisant with it; so serious have been many of the lapses from discipline, so disastrous many of their results, that even public demonstrations against the causes of them have been more than once evoked. We are distressingly familiar now with the unwonted appearance presented by a great charity the officers of which are called to answer for irregularities of conduct in the dock of a criminal court or behind the bar of a witness box; and the hope for some time entertained that the infatuated official who is primarily to blame for the myriad misfortunes that have overtaken a noble institution would reform his ways, is now permanently and effectually shattered. In place of striving to regain that confidence which has been destroyed, by acts of real beneficence,

the matron with whom the trouble at Guy's originated has persistently refused to swerve an inch from the path of determined opposition to the traditions of the Hospital and the interests those traditions support. From the first her proceedings have reacted detrimentally to the good of a noble charity, and although the irremediable mischief of her course has been times without number exhibited before her, we have been from time to time, notwithstanding, disgusted by fresh acts of open defiance of those laws which are supposed to govern the relations subsisting between a matron and the staff she should rightly be subservient to.

We have sufficiently dwelt, in previous issues, on the actual position the matron at Guy's, as at every other hospital, should occupy in the administration of the charity; and it has been abundantly shown how radically different is the real position assumed by her. Now, it is a fresh proof of the wholly impossible nature of the relations maintained between herself and her subordinates that points afresh the weakness of the appointment which placed the present matron of Guy's in the position she occupies. When this lady first entered on the duties of her office she saw fit to require the discharge of whole batches of the nursing staff of the hospital, the majority of whom refused compliance with arbitrary rules, which effected a complete revolution in the arrangements under which Guy's had so long achieved a world-wide reputation for excellent nursing. In this way a great number of old, tried, and valuable servants were discharged, or compelled to resign in order to make room for other nurses trained in accordance with the principles advocated by the imported head of the nursing department. The result is matter of history: Guy's Hospital for the first time in its career figured in a police court, and one of its nurses was adjudged to be imprisoned for three months on the charge of manslaughter.

How many similar errors to that which culminated in the death of a patient and the conviction of the nurse by whom her decease was hastened, have occurred since then, we do not know; we only know that on several separate occasions, the nurses, or others of the resident staff of Guy's, have been under the necessity of affording explanations to account for practices foreign to the administration of other hospitals, and leading to results little in accordance with the previous history of Guy's; and we may, with some justice, assume that not every case of malpractice became matter of public scandal. Be this, however, as it may, enough has been done and said in connection with the charity to justify the outspoken reprobation heaped upon the heads of those who are first and foremost, the responsible agents of the evil changes; and it is with no light feeling of unconcern, in consequence, that the public and the general profession will regard the matron's latest proceeding. In virtue of the authority exercised by her, it has been decided by the governors—who apparently remain as much as ever the puppets of the treasurer—that a sister, of more than twelve years experience in Guy's Hospital, shall be dismissed from her post. There is something that is more than disagreeably suggestive in the fact that the call to resign is accompanied by the offer of twelve months' salary. This is a plain indication that the governing body acknowledge the

gross injustice of the decree they feel themselves compelled to register, and are, at the same time, powerless to do other than what is demanded of them by the directors of their actions. There is something so pitifully and miserably little about the whole proceeding, that we would infinitely prefer to have let the record of it be buried in absolute silence. To do so, however, would be an injustice at this time, since it serves to show that nothing even yet has occurred to change the current of events at Guy's; and since it is a conclusive proof that some definite and decisive action need be quickly taken to end a state of affairs that is promising total destruction to an ancient and once useful charity. That an old and trusted servant is again and again attacked by charges which are invariably rebutted by her, and that in spite of the invaluable aid rendered by her to the hospital, she should be compelled to resign, since no cause for otherwise removing her can be found, and this solely on account of the inability of her superior officer to tolerate those habits and abilities which made her a perfect nurse under the *regimé* prevailing before the advent of the present matron exhibits a picture whose reflection is not a pleasant one, and the wonder is, that of all the world, the governing body of Guy's is alone insensible to the terrible moral it conveys. Since it is necessary now to devote the income of the hospital to purposes which no sophistry can conceal, are necessitated by the matron's government, where is the guarantee that, year by year, the sum may not grow until it reaches proportions beyond all calculation, and ruinous to the income of the charity. Or, on the other hand, since at the will of the matron, dismissal is ordered of officials against whom no fault can be found, except that she is unable to work smoothly with them, what limit can be set to the possible growth of so imperious a power?

However it may be regarded, the question of the management of Guy's Hospital, as now before the world, is a pressing, and an important one, and the answer to it should not be longer delayed.

CONSULTATION WITH HOMŒOPATHS.

THE gauntlet thrown for the homœopaths by Dr. Bristowe and Mr. Jonathan Hutchinson at the Bye meeting of the British Medical Association seems likely to be taken up by those who object to the proposed fraternisation of our profession with these schismatics. The *Lancet*, in a leading annotation on the subject, says that:—

"Mr. Hutchinson's address on surgery establishes the belief suggested by Dr. Bristowe's address in medicine, that a very deep and well-concerted scheme has been laid by the Council of the British Medical Association, or those who govern the Council, to reverse the ethical principle which has regulated the attitude of the profession in all civilised countries towards homœopathy."

We certainly share with our contemporary the strong suspicion that the blandishments uttered by the orators of the Association are—if not part of a scheme for the annexation of homœopaths—at least, a reflex of the hankering of the Committee of Council after such a consummation.

In a letter to the last issue of the *British Medical*

Journal Mr. Nelson Hardy expresses his opinion that the orators at Ryde have "placed the Association" in a false position by their "unfortunate utterances," and that "unless and until the opinions expressed by Dr. Bristowe and Mr. Hutchinson are authoritatively disavowed, the responsibility will naturally fall on the body [the Council], whose officers for the time being they were."

We are altogether of this opinion. We cannot believe that either of these gentlemen would have plunged neck-high into the discussion of homœopathy, or devoted their eloquence to the white-washing of that form of quackery if they had not reason to suppose that their utterances would meet, at least, with toleration on the part of the Executive of the Association. Moreover, we cannot altogether disassociate the Public Orators of the body from the body itself; and we expect that the homœopaths will take good care to represent the extraordinary tenets of the speakers as the official pronouncements of the Association.

In an obscure corner of the outside column of the *British Medical Journal* we find the following editorial reply to "H. N."—

"The readers of Addresses in Medicine, Surgery, Obstetrics, &c., select their own subjects, and deal with them in their own way without communication with any other person, officially or unofficially, and without any suggestion or censorship. The Committee of Council select, in all cases, gentlemen of acknowledged eminence in their respective departments. The readers of addresses are alone responsible for the choice of subject, and the mode of dealing with it."

We cannot regard this sort of disclaimer as a sufficient expurgation of the Association from complicity in the opinions to which we object; though, if the statement were produced as an official declaration in the editorial columns, it might bear a different aspect.

To be brief, we invite Dr. Bristowe and Mr. Hutchinson to relieve the Association of the responsibility of their individual utterances, and to make it clear to the public that the profession within the ranks of that body have given no adherence or approval to those utterances. If these gentlemen will not do this, we insist that the Committee of Council ought—however unpleasant the task of disavowal may be—to do it for them. The Committee owes this duty to the profession, to the character of the Association, and to the majority of the members who, we fully believe, entirely repudiate fraternisation with Hahnemannists. If the Committee flinches from the performance of that duty, we hope the members of the Association will indicate their disapproval by an immediate protest. If the movement for levelling scientific medicine down to homœopathy is permitted to grow, it will be impossible, after a time, to crush it out. That movement has made its *debut*, and we look to those who have regard for the honour of the profession not to allow the Association to be made the medium for so discreditable a *rapprochement*.

DURING the three months ending June last, 6,459 inquest cases were registered in England and Wales, equal to 5.3 per cent. of the total deaths; this proportion exceeded that which prevailed in any recent corresponding quarter. In the twenty large towns, the proportion of inquest cases averaged 6.5 per cent.; it was but 2.9 in Oldham and 3.6 both in Brighton and Wolverhampton, whereas it ranged in the other towns to 9.9 and 10.1.

Notes on Current Topics.

The Teaching of Aural Surgery.

THE general ignorance of students and practitioners of the elements of aural surgery and the serious results which are often due to this ignorance are well known to all who have given any attention to the subject. It is high time that more attention was given to the diagnosis and treatment of ear affections in our medical schools. Of course, it is not to be expected that all practitioners should have special knowledge, but there are certain elementary things which all should know. Every practitioner, for example, should be able to recognise a normal membrana tympani with the speculum, should know when, and how properly, to use the syringe, and also how to employ Politzer's method of inflation. We are glad to hear, therefore, that, at the late meeting of the British Medical Association, resolutions were passed in the subsection of Otolology to the effect that it was desirable a committee should be appointed to inquire into the best means of promoting the study of aural surgery, and of inducing the examining bodies to include it among the subjects in which questions might be asked at the pass examinations. If students were given to understand that they might have to answer a question on aural pathology or therapeutics, they would pay more attention to the subject. All our leading medical schools now have departments for ear diseases, and those who wish to study the subject further will find opportunity and material at special institutions. We trust that the committee proposed may be appointed, and that its labours may be successful.

The Chicago FASTER.

THE man, Griscom, of Chicago, who entered on a fast in emulation of the late Dr. Tanner's undertaking, has completed the task, under what the American papers announce to be favourable circumstances. It is asserted that the fast was superintended by several respectable and reputable physicians, among them being Dr. Raines, a member of the Faculty of Rush College, and some interesting statistics are given connected with the progress of the faster's body to emaciation. Thus, at the commencement of the experiment, Griscom weighed 197½ lbs., and in seven days lost 18½ lbs., his weight at that time being 179 lbs. Only 1½ lbs. more had been lost by the thirteenth day, but by the end of the third week the total amount lost rose to 29½ lbs. This had risen to 34½ lbs. on the thirty-first day, and to 46½ lbs. on the fortieth, 2 days before the termination of the fast. During this time the man drank an average daily quantity of thirty ounces of fluid water, and not confining himself to the prone position, even took some very considerable walks up to the end of his [self-imposed] task. Measurements were made of his limbs and body on the first and last days of the fast, with the following result. The abdomen measured on the first day, 43½ inches, on the forty-second day, 30 inches. Fore-arm, first day, 11½, last day, 9½; arm, 12½, and 10½ inches respectively; thigh, 21 and 17½ inches, and the calf of the leg, 16 and 12½ inches, on the same two dates. These figures possess a certain interest, which, however, is entirely dependent on their being trustworthy records. It

would seem that less suspicion attaches to the performance of the Chicago faster than was associated with Dr. Tanner's feat, and in this assurance the details may be accepted for what they are worth.

Exophthalmic Goitre.

IN communicating to the Société de Médecine, of Paris, a case of exophthalmic goitre, M. C. Abadie brought forward some interesting ideas respecting the pathology of the affection (*La France Médicale*). According to him a pathognomonic sign is spasm of the levator of the upper eyelid. When the patient looks down the levator of the upper eyelid remains motionless, and all the upper part of the sclerotic is left uncovered.

M. Abadie finds an explanation of the different forms in the localisation of the morbid process in the different parts of the cervical sympathetic. If the superior cervical ganglion is attacked, vascular troubles will be especially marked in the eye and head; lesions of the middle ganglion act upon the thyroid body; cardiac troubles are connected with alterations in the inferior cervical ganglion. This is only a hypothesis, but it is an ingenious hypothesis which pathological anatomy alone can upset or confirm.

Distinction to Mr. MacCormac.

THE indefatigable exertions of Mr. W. MacCormac, in connection with the recent International Congress, are about to be rewarded by the honour of knighthood, the Queen having signified her intention of conferring this distinction on him. There are few of those who participated on the doings of the Congress, at least, who will not feel glad at hearing the news of this most fitting reward. The success of the great medical meeting was, in an eminent degree, consequent on the tact, industry, and unflagging interest displayed by the Honorary Secretary General; and even had Mr. MacCormac's claims been entirely those forged by his endeavours to make the late Congress a success, he would be fully entitled to receive the honourable recognition about to be bestowed on him by the Sovereign. We know, even, that this is not the only claim he possesses, and his services in behalf of the advance of surgery are of no inconsiderable amount. In every respect, Mr. MacCormac is deserving of the honour in store for him, and we heartily congratulate him thereupon.

Nerve Stretching.

THE results obtained after stretching nerves as a means of checking chronic and intolerable pain are becoming more frequently placed before the reading world by surgeons who claim to have successfully performed the operation. Indeed, there seems a danger lest the new procedure should offer temptations to the young surgeons which it would be better for them to avoid—at least, for the time—since the number of recoveries due to nerve stretching is hardly yet encouraging enough to warrant its general introduction as a remedial measure. In most of the recorded cases we are given the condition of the patient one, two, three, and, as a rule, at most six months after the operation; and in no inconsiderable number of these there is described a return of symptoms, slight at

first, but undoubtedly indicating that only a temporary advantage had been gained by the operation. In the New York *Medical Record* Dr. G. M. Hammond describes two cases in which he performed nerve-stretching, and congratulates himself on the fact that now, less than three months after, there has been no return of the pain for the cure of which the measure was resorted to. Had the time been three years there would have been reason for the satisfaction evinced, but as it is, with nerve stretching on its trial, we cannot but think it is unwise to build high hopes on such cases.

Necrosis of almost the Whole Temporal Bone.

A REMARKABLE case observed by Dr. J. Gottstein is reported in a recent number of the *Archiv f. Ohrenheilkunde*. It was that of a child a year and a half old who, for a year, had had otorrhœa on the right side. There was developed behind the ear a tumour, which on examination proved to consist of a sequestrum. This was made up of the entire mastoid process, part of the cavity of the tympanum with the osseous portion of the tube, a part of the squamous portion, the anterior and posterior wall of the petrous bone, and lastly, the labyrinth and semi-circular canals. By a rare chance the roof of the tympanum appeared over the sequestrum perfectly intact. The expulsion was successful, and the result favourable.

Hæmostatic Pills.

DR. HUCHARD often prescribes the following pills in various forms of hæmorrhagia, as metrorrhagia, epistaxis, and hæmoptysis. R Ergotine, sulphate of quinine, of each, 2 grammes; powder of digitalis, extract of hyoscyamus, of each, 20 centigrammes. To be divided into 20 pills. From 5 to 8 or 10 to be taken in a day. In this very complete formula the ergotine and sulphate of quinine act on the contractility of the vessels, the digitalis on the circulation, and hyoscyamus on the irritation and pain.

The President's Progress.

THE progress made by the President of the United States along the path of recovery has unfortunately justified the warnings we threw out some weeks ago. We then, when the papers seemed to anticipate that all danger had been past, ventured to deprecate such hasty conclusions, and urged that time sufficient had not elapsed to justify them. Now the truth of these observations is but too mournfully realised, and the condition of the illustrious patient amply confirms the opinion we expressed on the case. The nature of the wound, the unsatisfactory account of it, and of the progress made by it, the details being of the most meagre description, suggested caution in speaking of probable results. A study, moreover, of what was described, and an attentive consideration of the possible issues, even under the most favourable circumstances, would never, to us, justify the sanguine utterances so freely indulged in on the other side. To the wonderful constitution and pluck of the President is probably due the gallant fight so far made; and to the same good agents must we chiefly trust for further improvement. With the most

heartfelt wish, however, that this may be speedy and certain, we dare not conceal a dread lest it may not take place.

Thought-Reading on Its Trial.

ONE of the "sensations" of the International Medical Congress was the *fiasco* which was developed when the experiments of Dr. Beard, of America, upon an imported professor of hypnotism and thought-reading was shown to a party of psychologists at the Waterloo Hotel, in Jermyn Street. Dr. Beard made an elaborate communication upon the science of trance, and produced his subject for the criticism of the audience. Dr. Crichton Browne has, in a long letter to a contemporary, given a full, and what he considers a true, account of the phenomena developed by this subject, and has plainly inferred that the whole affair was an imposture—at least, on the part of the subject. He puts certain categorical questions to Dr. Beard, which, if answered in the affirmative, would convict that gentleman of complicity. We suspend judgment until the reply comes. We recognise the moral courage which enabled Dr. Crichton Browne to make a clean breast of the facts as he has done. If he thinks the transaction was an attempt to deceive the profession, he deserves our warmest thanks for saying so without qualification or compromise.

The British Association for 1882.

AT a recent meeting, held at Southampton, under the presidency of the Mayor, it was unanimously resolved to confirm the accepted invitation by the British Association at Swansea, to hold next year's meetings at Southampton, which was selected in competition with Leicester, Southport, and Nottingham. The financial difficulties in which the town of Swansea had become involved through the expenditure for affording the necessary accommodation were fully considered, and the forty gentlemen present subscribed and guaranteed a sum of about £350, to form a nucleus of £1,500, the maximum sum required. It was announced that the whole of the large public companies had promised their warmest support. One of the reasons given for the selection of Southampton was its contiguity to Osborne, which would enable Prince Leopold, the President of the Association, to attend.

The Metropolitan Water Supply.

DR. FRANKLAND reports that the water supplied to the metropolis during the month of July was above the average of the two previous months. This remark especially applies to the water drawn from the Thames by the Chelsea, West Middlesex, Southwark, Grand Junction, and Lambeth companies. The supplies, however, of the West Middlesex, Grand Junction, and Lambeth companies were slightly turbid owing to inefficient filtration. The Lea water distributed by the New River and East London was decidedly of better quality than usual: both were efficiently filtered, whilst that of the latter was superior to any of the Thames waters, and second only to the best of the deep well waters. The deep well water sent out by the Kent and Colne Valley companies, and by the Tottenham Local Board of Health was, as usual,

of excellent quality for drinking, and the Colne Valley, by softening their water previous to delivery, rendered it suitable for washing and all other domestic purposes.

Colonel Bolton very properly calls attention to the condition of the receptacles for water, and adds that very many tanks, cisterns, and butts, especially in small tenements, are "in a disgusting and filthy condition." If this be so, then officers of health or inspectors of nuisances can hardly be doing their duty. We are, however, of opinion from having paid some attention to the subject that this complaint is a little exaggerated; the danger to health is, certainly, far greater when the house supply is in connection with the water closet supply; and the only remedy for such a state of things is the adoption of the constant supply system, and more pressure ought to be put upon the companies to cause them to extend the constant supply in all the poorer districts, and with as little delay as possible.

American Prize Questions.

THE following are proposed for the Boylston prizes for 1882:—1. Sewer-gas, so-called (the gas found in sewers): What are its physiological and therapeutical effects on animals and plants? (300 dollars.) 2. The therapeutical value of food administered against or beyond the patient's appetite and inclination? (200 dollars.) For 1883:—1. Measles, German measles, and their counterfeits. (200 dollars.) 2. The differential diagnosis of abdominal tumours, especially those connected with the genito-urinary organs. (200 dollars.)

Women at the University of London.

WE recently stated that three ladies had passed the first M.B. examination at the London University. In the honours list the names of all three are mentioned. Miss Frances Helen Prideaux takes the exhibition and gold medal in anatomy, Mrs. Scharlieb takes first-class honours in materia medica and pharmaceutical chemistry, and Miss Emily Tomlinson obtained marks qualifying for a gold medal in organic chemistry.

Auriculo-mastoid Oily Cyst.

DR. GILLETTE communicated to a recent meeting of the Société de Chirurgie (*Le Praticien*) a case of oily cyst of the left auriculo-mastoid region in a woman, *æt.* 30. The tumour, which was very probably congenital, was the size of a pigeon's egg, was very fluctuating and transparent, and the skin very thin. He thought he had to deal with a serous cyst, but puncture with a moderate sized trocar gave exit to a liquid exactly resembling olive oil which coagulated with cold, like oil in the winter.

The Coffee Palace Movement.

A MONSTER coffee tavern, said to be the largest in the kingdom, was opened at Woolwich last week. It has cost nearly £10,000, and is situate close to the Arsenal station of the North Kent Railway. It has three classes of dining rooms, library, reading and recreation rooms, and a large public hall, capable of seating 1,000 persons. A special feature of the scheme is the bedroom floor, where accommodation is provided for a number of single men lodgers.

A Sanitary and a Social Problem.

THE latest quarterly return issued by the Registrar-General is in some respects a very satisfactory document. The death-rate in the first half of the present year has not exceeded 20·1 per 1,000 of the entire population, a ratio 2·2 below that of the corresponding period during the ten previous years, and lower than it has been at any time since registration came into use in 1837. According to the census returns the decline in the death-rate, which has taken place in the ten years 1871-80, implies the survival of 299,385 persons who would have died had the death-rate of the previous corresponding period continued. By similar calculation the saving in life shown by the diminished death-rate of the first half of the present year equals that of 28,623 persons.

Turning to another aspect of the question, namely, the money value of the lives thus saved, the "Statistical Abstract of the United Kingdom" furnishes details which, at first glance, are not altogether of a satisfactory nature. According to that report whereas fifteen years ago £6,439,517 was the sum expended in the relief of the poor, the sum required for that object in 1880 reached £8,015,010, so that either the will or the physical power of the masses to earn sufficient wages to maintain themselves and those dependent upon them has decreased during the intervening period. It may reasonably be made subject to inquiry how far this result is assignable to the one cause or other, or in part to both. At the same time the fact is well known that of the population of our poorhouses a very large proportion would properly be suitable inmates of hospitals; that very many more among all classes of the population are the subjects of infirmities, disease, or imperfect health, and that as the population of large cities continues to increase so the proportion of persons thus affected may be expected to augment. Then again, it certainly does not appear that up to the present time "sanitation" has had any effect in reducing the prevalence of certain diseases, more especially diarrhoea, diphtheria, and fever of typhoid type; the recent epidemic of small-pox further shows that the virulence of that disease has undergone no diminution whatever.

The Wool-Sorters' Disease.

A REPORT, of which the following is an abstract, of Prof. Brown, the Professional Officer of the Veterinary Department, has been presented to Parliament:—

The inquiry recently conducted by Mr. Spears at Bradford has established the fact that the wool-sorters' disease, which was first observed forty-three years ago, when the import of mohair commenced, is a form of anthrax, a disease which is due to the presence of a microscopic plant, the *Bacillus anthracis*, in the fluids of the body.

Anthrax is essentially an affection of the lower animals, but it is as readily communicable to man as to the lower animals by the introduction of the spores of the *Bacillus anthracis* into the blood.

Anthrax, in the form of splenic fever, has long been known in this kingdom as a disease which occurs occasionally among farm stock. The affection does not spread to any extent by contagion. The disease is more virulent in some parts of Ireland than it is here, and on the Continent

it sometimes prevails extensively. The Siberian plague, which is now rife in Russia, is one of the most virulent and fatal forms of this disorder.

So far as animals are concerned, the risk of the communication of anthrax through the agency of the refuse of wool factories used as manure is comparatively slight, and might be further diminished by limiting the use of such refuse to arable land.

It has been suggested that the sale of wool-bags and the refuse of wool factories should be prevented; but the measure could hardly be justified on the evidence which has been adduced as to the injury which such substances are likely to cause. I am not aware of any outbreak of anthrax having been traced to the use of wool-bags for any purpose, and there is only one instance recorded of the appearance of the disease under circumstances which afforded reasonable ground for concluding that it was due to the use of sewage mixed with wool refuse on land where cattle were grazing.

A more serious aspect of the question is the danger to which the wool-sorters are exposed, owing to the mixture in the bales of wool of inferior sorts of wool, some of which have undoubtedly been clipped from the skins of animals which have died of anthrax. Legislation could not prevent the foreign exporter from mixing the inferior with the best quality of wool; and in order to detect this fraud it would be necessary to sort the wool while in charge of the Customs—a proceeding which would merely divert the risk of disease from the workers in the factory to the examining officers.

Ad Huncem Exemptions.

AT the recent pass examination for membership of the London College of Surgeons the following recognised licenses were held by some of the candidates, exempting them from an examination in medicine, viz.:—L.S.A., 44; M.B. Edin., 6; L.R.C.P. Edin., 5; M.B. and C.M. Aber., 2; M.D. Kingston, Canada, 1; M.D. Paris, 1; M.D. Queen's Univ., Ire., 1; L.K.Q.C.P. Ire., 1; L.R.C.P. Lond., 1; M.B. Toronto, 2; M.B. and L.R.C.P. Edin., 1; M.B. Durh., 2; &c.

The Dangers of Colour Blindness.

ACCORDING to a statement made on June 9th by the Inspector-General of Steamboats at New York, the pilot of the City of Austin, through mistaking the colour of the buoys in the channel, lost the vessel in the harbour of Fernandina; no lives were lost, but the estimated loss on the vessel and cargo was two hundred thousand dollars.

The City of Austin, being a registered vessel, was not required to carry a pilot licensed by the United States steamboat inspectors, so she had one licensed by the State of Florida, which State had not yet followed the example of the United States Steamboat Service of examining the vision of pilots, and of refusing licences to those found to be colour-blind. After the loss of the vessel named it appears that the State pilot commissioners of Florida requested the United States steamboat inspectors at Savannah, to examine their pilot for colour-blindness, which they did, and found that at the short distance of six feet he could not distinguish one colour from another.

English Hospital Bequests.

LADY HARRIET M. SCOTT BENTINCK has given £2,000 to University College Hospital, £1,000 to St. Mary's Hospital, £1,000 to the Royal Hospital for Diseases of the Chest, and £700 to the North Eastern Hospital for Children. The Princess Frederica's Convalescent Home has received £482 1s., the proceeds of an entertainment at Hampton Court Palace on the 5th instant. Dr. Thos. Radford, of Higher Broughton, bequeathed £200, to be applied, under the direction of the medical committee of St. Mary's Hospital, Manchester, in the purchase of casts, &c., to be placed in the Radford Museum at the said hospital. Mr. Octavius E. Coope, M.P., has given £100, Mr. G. S. Gibson £100, Mrs. Packe 50 guineas, and Mr. John Berners £50, to the Eastern Counties Asylum for Idiots at Colchester. Mr. A. Skinner has given £33 12s. additional to the City of London and East London Dispensary. The Rev. R. Steward Gregory has given 30 guineas to the Royal Hospital for Diseases of the Chest.

FROM diseases of the zymotic class measles showed the largest proportional fatality in Liverpool and Bristol; and scarlet fever in Hull, Nottingham, and Leicester. The fatal cases of diarrhoea, which had been 776, 533, and 488 in the three preceding weeks, further declined to 412 last week; the annual death-rate from this disease averaged 28 per 1,000, and ranged from 0·7 and 1·1 in Plymouth and Bradford, to 7·1 and 9·3 in Hull and Leicester. Two more deaths were referred to diphtheria in Portsmouth. Small-pox caused 41 more deaths in London and its suburban districts, and one in Hull.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

VIVISECTION IN EDINBURGH.—In spite of the weekly petitions to the Almighty at prayer meetings in Edinburgh and which have become as chronic as the petitions to prevent Mr. Bradlaugh entering Parliament, vivisection is still and rightly conducted in Edinburgh. Professor Fraser, at the late Congress, waxed hot on the prohibition placed upon some experiments he proposed making, but scientific investigators in this country have, to a great extent, to thank themselves for the restraints under which they are placed. For pure scientific investigation, and for the purposes of determining the communicability of disease, as in the recent Aberdeen epidemic, no one will deny that vivisection and other experiments on animals are not only allowable, but justifiable, but who can say that for mere purposes of demonstration to a class of students vivisection is permissible, especially when the fact demonstrated is worn threadbare. For instance, what good is there in dividing the sympathetic nerve in half a dozen rabbits that some dozen students after lecture may tug away at their ears to distinguish the difference on the two sides of the creature's head. It is this and like practices that have raised all the opposition to vivisection, and that brings Miss Frances Power Cobb to Edinburgh to denounce the practice, and foster further agitation.

BIRTHS, MARRIAGES, AND DEATHS IN SCOTLAND.—The annual report of the Registrar-General on the births, marriages, and deaths registered in Scotland during the year

1880, has just been issued, from it we glean that the population of all Scotland, estimated to the middle of 1880, was 3,661,292. During the year 124,652 births, 75,795 deaths, and 24,489 marriages were registered. These figures show that the birth-rate was 0·114 below the average of the ten immediately preceding years, that the death-rate of 1880 was 0·122 below the ten years' average, and that the marriage-rate of 1880 was not only below the average, but, with the exception of 1879, the lowest hitherto recorded in our annual reports. The number of births registered in all Scotland in 1880 was 124,652, being at the rate of 3·40 per cent., or of 340 for every 10,000 of the estimated population. Of the registered births 10,498 or 8·42 per cent. were illegitimate. In the insular rural districts the percentage of illegitimacy was 5·99. In the large towns 6·53, the small towns 7·97. In the principal towns 8·11, and in the mainland rural group 10·38 per cent. Of the 124,652 registered births 63,916 were males and 60,736 females. There were thus 105·2 male for every 100 female births. 24,489 marriages were registered in the whole of Scotland during 1880, being at the rate of nearly 67 for every 10,000 of the estimated population. This rate, although somewhat surpassing that experienced in 1879, is among the lowest recorded during the last five and twenty years, and is, we may assume, connected with the recent period of commercial depression, from which the country is only beginning to revive.

GLASGOW BARONY PARISH AND THE DISTRICT LUNACY BOARD.—The inspector of poor of the Glasgow Barony parish has received a letter from the Secretary of the General Board of Lunacy, in which he states that the General Board, taking into account that the Barony Board possesses satisfactory accommodation for its pauper lunatics, considers it reasonable that it should have total relief from assessments for building, furnishing, and maintaining asylums in the Glasgow lunacy district, provided that such accommodation continues to be upheld to the satisfaction of the General Board.

VISIT OF THE QUEEN TO THE ROYAL INFIRMARY, EDINBURGH.—On Wednesday last, the day of her arrival, the Queen visited the Royal Infirmary, and spent some time in the Institution. At her request, two of the wards have been re-named, one after the late Prince Consort, and the other after herself. The Queen was received by the Lord Provost, Sir Thomas Boyde, and the medical and surgical staff, several visitors being also present, among whom was noticed the venerable Lady Ruthven, of Winton, who is now over ninety years of age, and with whom Her Majesty shook hands in the most cordial manner. The wards visited were those of Mr. Joseph Bell and Dr. Muirhead. In the former one case attracted Her Majesty's attention and called forth from Dr. Bell the following history:—The patient, a little girl, who had been sent in from the country, was one day suddenly seized with a fit of convulsive breathing, which threatened an instant and fatal issue. In a short time, however, she recovered and appeared perfectly well. The cause of these peculiar symptoms could not then be ascertained, but as they recurred at irregular intervals it was deemed advisable to send her to the Infirmary. On her arrival there her throat was carefully examined, but nothing peculiar was at that time discovered. During Mr. Bell's absence from the ward the child experienced another attack of suffocative breathing, and was pronounced dead by those around her bed. The child was at once carried to the operating theatre, when it was found that the pulse and respiration had become imperceptible. Tracheotomy was, however, at once performed without any apparent beneficial result. Notwithstanding this, the usual means of inducing

artificial respiration were persevered in for upwards of half an hour before the slightest indication of a renewal of respiration could be detected. After that period slight signs of recovery made their appearance, and the little patient gradually recovered. Since then a careful examination of the larynx has revealed the presence of a portion of the skin of a gooseberry which had become impacted in one of the ventricles of the larynx. Mr. Bell proposes to remove the foreign body as soon as the irritability of the parts has subsided and removal can be safely attempted. Her Majesty patted the little sufferer on the cheek, who seemed quite to realise the attention she had received.

CASUALTIES AT THE REVIEW.—Only one fatal case is recorded, that of a man who is supposed to have fallen over the cliff close to "Samson's ribs" in the dark. Several accidents to civilians occurred, and were treated at the military field hospitals and at the Infirmary. One of the volunteers fractured his knee-cap, and another was seized with epilepsy. The Queen caused inquiries to be made at the Infirmary as to the condition of the sufferers, all of whom have returned home except the case of fracture of the patella. Considering the swampy slippery state of the ground, especially at the hill sides, the small number of accidents is most remarkable, and is entirely owing to the good nature and orderly behaviour of the enormous crowd. Exposed to a pitiless downpour of rain, everyone seemed in a good temper, the slightest incident serving to convey amusement to those around.

THE ELECTRIC LIGHT IN EDINBURGH.—An attempt to light Edinburgh by electricity during the Queen's visit has proved a failure. The lamps after burning for a few hours suddenly went out, leaving the crowded streets in almost total darkness, a few gas lamps here and there only tending to make the darkness more apparent.

WATER FOR THE TROOPS.—In order to provide water for the troops, troughs 40 feet in length, were erected at the different places of rendezvous, each trough being supplied with 50 drinking cups. An official was stationed at each trough from nine o'clock, to regulate the supply, and see that no deleterious matter was introduced into the water. Somewhat similar provision was made at the railway stations, the necessary facilities having been granted by the Water Trust.

Literature.

INVESTIGATIONS INTO THE ETIOLOGY OF TRAUMATIC INFECTIVE DISEASES. (a)

THE words pyæmia and septicæmia no longer retain their original meanings; and the idea of the former being caused by the actual presence of pus in the blood, has been long given up. Much confusion has, in latter days, been caused by different pathologists attaching different meanings to these terms; and, therefore, our author most properly clears the ground, *in limine*, by including, under the term septicæmia, those cases of general traumatic infection, in which no metastatic deposits occur; and under pyæmia, those in the course of which they may present. This is, we believe, the proper distinction to draw, if any distinction be necessary; but the main object of the book is to consider the question whether these great groups of disease are caused by the presence of those myriad micro-organisms called bacteria, which are now supposed to play so great a part in nosological processes. Conheim has shown that after tracheotomy the diphtheritic disease often spreads from the mucous membrane of the

(a) "Investigations into the Etiology of Traumatic Diseases." By Dr. Robert Koch, of Wolfstein. Translated by W. Watson Cheyne, F.R.C.S. London: New Sydenham Society, 1880. Pp. 74, with five plates of histological illustrations.

trachea to the operation wound; and there is now no doubt that the so-called mycosis of the navel in new-born infants (navel mycose), belongs to this same group of disease, and Weigert, in describing a case of this latter kind, states that the ulcer of the navel was covered with micrococci. Coze and Felts conducted a series of experiments, with a view to producing artificial septicæmia in animals, by injecting blood from a patient who had died of puerperal fever, into the subcutaneous cellular tissue of a rabbit. They then injected some of the blood of that rabbit into another; and so on, until they showed that the poison multiplied in virulence as they went along, until at last a very minute dose produced the poisonous effects. A similar result was obtained with erysipelous poison. Klebs introduced the plan of artificially cultivating the septic poisons in artificial nutritive fluids; and, finally, Orth has grown erysipelous bacteria in an organic fluid, and has, after a long interval, reproduced the erysipelas by the inoculation of a living animal with that fluid. After a series of experiments, our author comes to the great fundamental conclusion (p. 15) that bacteria do not occur in the blood, or in the tissues of the healthy living body, either of man, or of the lower animals. He speaks of the great difficulty of accurately recognising bacteria—a difficulty with which every microscopist will sympathise—but recommends Abbe's mode of illumination as constructed by Carl Zeiss, of Jena (p. 27.). This method appears to us to much resemble the achromatic condenser of Ross, or of other first-class British makers. A very practical contribution is given (p. 32), by the author's suggestion, to stain with aniline the section of a tissue suspected to contain bacteria, and then wash it in a weak solution of carbonate of potash. By this means the nuclei, and the plasma cells, in fact, all ordinary animal tissues lose the aniline colour. The bacteria alone remain coloured. We have tried this test, and can vouch for its practicability and accuracy.

It would be perfectly impossible within the limits of our review, to dwell upon the many interesting points of this most admirable research, which opens up a field of investigation, of which the author himself admits he has merely touched the surface. We would especially direct the attention of our readers to the chapter on artificial septicæmia in mice; on spreading abscess in rabbits; on erysipelas; and on the artificial production of anthrax. The whole subject is well summed up in the admirable concluding remarks.

This is one of the most striking pathological works which has, for a long time, come under the notice of the profession. It is a union of scientific medicine with the working details of everyday life. To pursue such a study, little is wanting but a good microscope, and a few simple re-agents, and we trust that the seed which has thus been sown will grow and flourish into a goodly plant. The histological plates are admirably executed and faithful in their least details.

SUPPLEMENT TO ZIEMSSSEN'S CYCLOPÆDIA OF THE PRACTICE OF MEDICINE. (a)

Finis Coronat Opus, the editor and contributors of Ziemssen's splendid cyclopædia might well have exclaimed when their last volume issued from the press not long ago. In most cyclopædias, the work of many hands, a great difference is discernible in the merit of the different articles, and it is seldom that we find the uniform and sustained excellence of Todd's Cyclopædia of Anatomy and Physiology of the one now under consideration. It is many years since the initial volumes of Ziemssen appeared; and, since that time, medical progress has not been stationary; and accordingly the Encyclopædia was hardly finished when its able compilers set themselves (a new edition being manifestly for the present out of the question) to frame a supplementary volume which would carry the whole work up to the most advanced point of progress. They have well succeeded, and have produced a book of the most profound interest to the scientific and practical physician, embracing then ewest researching upon typhoid and upon relapsing fever; upon the oriental plague, including the reports of the recent International Commission; upon yellow fever; on all the exanthemata; on syphilis; on malarial diseases; hydrophobia; trichinosis; dengue; cerebro-spinal meningitis; and the local diseases of the different

(a) "Supplement to Ziemssen's Cyclopædia of the Practice of Medicine." Edited by George L. Peabody, M.D. Royal 8vo. p. 844. London: Sampson Low, Marston, Searle, and Rivington. 1881.

organs throughout the body. In fact, the newest researches are presented upon almost every subject; the exceptions being those contained in the latest volumes of the Cyclopaedia, or some in which during the last few years there has been little or no advance. The materials of the present volume are derived partly from original research, and partly from a painstaking digest of the recent literature of all countries. The trouble of such a digest must have been enormous, and the task has been faithfully and well executed. To such medical men as already possess Ziemssen's Cyclopaedia the present volume is, of course, a necessity; but even to those who do not, we would commend it as an independent work, giving a compact, thoroughly comprehensive yet brief, of the most recent advances in most of the departments of medicine. Although the publishers are British no European hand appears in the authorship. The editor and his twenty-eight assistants all hail from New York or Boston, with a few from Philadelphia, Chicago, and Cincinnati, and one who is described as a surgeon in the army of the United States. Is Uncle Sam going to take the same position towards Europe in medical literature as he has already taken in beef, corn, and machinery?

FOURTH ANNUAL REPORT OF THE BOARD OF HEALTH OF THE STATE OF NEW JERSEY, 1880. (a)

THIS report is addressed to Governor George B. McClellan, whose name was nearly twenty years ago in all men's mouths as the hero of the Potomac, but who now fulfils the humbler but perhaps more useful civic rôle, and presents a number of features of very great interest. The public consideration of questions of state medicine is taken up in the United States with an amount of energy of which we have in this country but little idea; and, accordingly, we find that all such subjects are locally discussed, and public opinion is educated by the various boards of hygiene which are formed in every district of New Jersey, a state which, right opposite the Empire city, vies with it in population and importance. The present report is one of the most interesting public documents of the kind which we have perused, and affords ample evidence of an intelligent sympathy on the part of the authorities and of the public, which cannot fail to have the most important bearings upon the most vital concerns of the whole population. The volume exhibits a series of valuable and practical essays upon diphtheria, both in its European and local aspects; upon the special epidemics of New Jersey; upon malarial fevers; upon kerosene explosives (a subject of profound local importance, and which was the immediate cause of the conflagration of Chicago); upon the sanitary state of their sea-side resorts; upon the regulations of medical practice; upon the diseases of animals communicable to man and otherwise; and upon quarantine sanitary defences. This latter subject is discussed in an enlightened spirit holding the balance evenly between the abstract desirability of quarantine on the one hand, and the impossibility of limiting the natural progress of trade upon the other. Where a place is away from the ordinary walks of commerce, such isolation is possible and desirable; but universal experience shows that, when trade is busy and communication brisk, such epidemics as yellow fever, the plague, and cholera, will overleap the most rigidly enforced artificial barriers. This volume also deals admirably with the all important subject of the general supply of milk to the public, and sub-soil drainage, both of which are thoroughly dealt with. The report concludes with the local reports of the various districts with the meteorological reports and with the vital statistics, with an appendix of the number of births, marriages and deaths in the different localities.

To our mind one of the most salient features of this sanitary review is that from first to last no mention is made of that most recent craze of a few sanitary enthusiasts on this side of the Atlantic, viz., the compulsory notification to the public authorities of infectious diseases by the attending physician, carried out regardless of the feeling and interest of the patient and of his friends. Our American cousins go far enough in the interest of abstract sanitation, and among other things they require that every medical man should, at stated intervals, notify to the public authorities the number of infectious cases

seen by him in his practice, their nature, &c., &c., so as to give the public sanitary authorities, a proper view of the amount of infectious diseases present in the district. It is to be presumed that the medical practitioners are remunerated for the performance of this useful and important public duty, and we are sure that they discharge it efficiently, amid the public approbation, and to the great public advantage. We note with satisfaction however, that over in the States nobody proposes that the medical attendant, the confidential friend of the family, should tear asunder the veil of secrecy and confidence, which shrouds his relation with the various families by exposing their secrets, perhaps to their injury and possibly to their total ruin. We trust that our well meaning but hasty sanitary friends near home will take this lesson into their consideration, and in future moderate their zeal within the limits of what is feasible and practicable.

Correspondence.

THE MARKING AT THE ARMY COMPETITIVES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In the *Medical Press and Circular* of August 10 an article appears in which you compare the number of marks gained by the Indian medical candidates with those obtained by the surgeons on probation, and from these draw conclusions not altogether flattering to the latter.

The reason for the great difference in the number of marks as shown by the published results is, however, easily accounted for.

In the case of the Indian medical candidates the number of marks gained at both the London and Netley examinations are added together, and they take precedence according to the combined results; while, on the other hand, the surgeons on probation are entirely placed according to the marks obtained in London; the Netley examination not counting, except as showing if they have taken advantage of the teaching at Netley.

If we consider the marks gained at Netley by the surgeons on probation and add these to those obtained in London we will find that the result will compare favourably with that gained by the Indian medical candidates.

Thus, the first man for the army service obtained 2,320 marks at London and 2,760 at Netley; i.e. a total of 5,080 or 130 marks below the first for the Indian service. While the last man gained 1,345 marks at London and 1,810 at Netley; giving a total of 3,155 or 165 above the last for the Indian service. These results show clearly that there was but slight difference in the merits in both cases.

I must confess, however, that the regulation by which the surgeons on probation rank entirely by the result of the London examination is, to say the least, ill advised. While this is the case these naturally conclude that the result of the Netley examination is of little consequence, and that the authorities attach but slight importance to it. They, therefore, believe that all that is required of them is to perform their ward duties satisfactorily, and that study is altogether unnecessary. Thus it will be seen that existing regulations indirectly tend to encourage idleness.

Would it not, therefore, be much better if the combined results of the examinations were taken into account, for matters as they at present stand are not only calculated to encourage idleness, but at the same time give rise to the idea amongst persons unacquainted with the facts of the case, that the members of the Army Medical Service are much inferior in many respects to those in the Indian service.

Yours truly,

G. HARRISON YOUNG, A.M.D.

[We cordially agree with our correspondent respecting the inexpediency of the present system of marking to which we drew attention some months ago, and we are sorry that a conclusion adverse to the home service surgeons should be drawn from the discrepancies to which our correspondent refers. Unless it be the intention of the authorities to discredit Netley and discourage the teaching at that school, we cannot comprehend the purpose of the regulation which refuses to give any credit to the cadet for his work there.—Ed.]

Army Medical Department.—The following is the list of candidates who were successful for appointments as surgeons in Her Majesty's British Medical Service at the competitive examination in London on the 15th August, 1881:—

	Marks.		Marks.
1 N. M. Reid ..	2,890	14 J. W. Jerome ..	1,920
2 W. H. G. Lewis ..	2,825	15 W. W. Pike ..	1,875
3 W. Dick ..	2,798	16 M. E. Fitzgerald ..	1,870
4 F. J. Jencks ..	2,141	17 L. H. Truefit ..	1,870
5 H. O. Stuart ..	2,125	18 J. M. Irwin ..	1,863
6 F. E. Treherne ..	2,105	19 G. J. Nealon ..	1,840
7 S. F. Loughheed ..	2,100	20 E. O. West ..	1,840
8 J. C. Haslett ..	2,075	21 W. A. Morris ..	1,825
9 H. J. Barratt ..	2,065	22 F. H. M. Barton ..	1,810
10 H. E. R. James ..	2,025	23 J. Heath ..	1,805
11 H. O. Trevor ..	1,890	24 C. E. Nichol ..	1,805
12 A. F. Russell ..	1,985	25 J. D. T. Beckett ..	1,805
13 R. J. Fayle ..	1,971		

NOTICES TO CORRESPONDENTS.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the *Medical Press and Circular*, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

LOCAL REPORTS AND NEWS.—Correspondents desirous of drawing attention to these, are requested kindly to mark the newspapers when sending them to the Editor.

DR. D.—Your patients can of course proceed against you to recover damages for disfigurement. Whether he will do so depends on the ease with which rascally lawyers can be found in your neighbourhood. Judging from the report of the case, we do not think an action will lie, however, but this unfortunately will not deter one of the class of "shark" attorneys from taking up the prosecution if he thinks costs may be got out of you. Certainly do not compromise. Let us hear again soon.

MR. WILLIAMS.—To do so would be to admit having made the mistake charged against you. Your best plan is to submit the prescription and an account of the case to the judgment of a trustworthy member of your college. Abide by his decision.

X. B. G.—The most exhaustive work is Pritchard's "Infusoria." There is being published at the present time a similar undertaking, but you will find the figures in Pritchard enough to serve your purpose. We have often verified specimens by their aid.

ENQUIRER.—We very well remember it. It led to a good deal of amusement at the time, but since the zest for it has apparently died away. It requires five men to be at all successful, and the greater the number up to twelve the more certain the result.

"JOB."—(1) Sodium bicarbonate. (2) Acid nitrate of mercury.

SOLAR.—One of the most unblushing quacks of the present age.

MR. EATON'S pamphlet will be noticed in our next.

ERRATA.—The introductory portion of "Sarsfield's" letter in last week's *Medical Press and Circular* under "Notices to Correspondents," has two misprints:—"Irruptatenet *Popula*" should be "Irrapta tenet-*Popula*;" and "I'press the strongest reason," &c., should be "I'press the strongest *litenses*."

Vacancies.

- Brighton and Hove Dispensary.**—Resident House Surgeon. Salary, £140, with furnished apartments. Applications to the Hon. Sec. by September 5.
- Great Yarmouth Hospital.**—Resident House Surgeon. Salary, £90 per annum, with board and furnished apartments. Applications to be sent forthwith to the Secretary.
- Knighton Union.**—District Medical Officer and Medical Officer of Health. Salary, £40 and £15 respectively. Applications to the Clerk to the Guardians not later than Sept. 1.
- Liverpool Northern Hospital.**—Assistant House Surgeon. Salary, £70, with residence. Applications to the Chairman of the Committee not later than September 12.
- Newcastle-on-Tyne Dispensary.**—Visiting Medical Assistant. Salary, £120 per annum. Applications to be forwarded to the Hon. Sec. on or before Sept. 5.
- Poplar and Stepney Sick Asylum District.**—Assistant Medical Officer. Salary, £120, with board, &c. Applications to the Clerk to the Managers not later than Sept. 5.
- Royal Isle of Wight Infirmary.**—House Surgeon and Secretary. Salary, £50, with board and lodging. Applications to the Secretary not later than September 13.
- Royal United Hospital, Bath.**—House Surgeon. Salary, £60, with board and residence. Applications to the Secretary on or before Sept. 7.
- Towcester Union.**—Medical Officer. Salary, £60, with fees. Applications to the Clerk to the Guardians on or before Sept. 5.
- West Kent General Hospital, Maidstone.**—House Surgeon. Salary, £120, with furnished apartments. Applications to the Secretary by Sept. 3.
- Worford House Hospital for the Insane.**—Assistant Medical Officer. Salary, £100 a year, to be increased to £120 after one year's service, with board and lodging. Applications (addressed to the President) to be sent to Dr. Phillips, Worford House, Exeter.

Worcester General Infirmary.—House Surgeon. Salary, £100, with board and lodging. Applications to the Secretary on or before Sept. 3.

Appointments.

- BARTON, T. B., A.B., M.D., L.R.C.S.I., L.M.,** Surgeon to the County Donegal Hospital, Lifford.
- BENDER, A. J., M.R.C.S., L.S.A. Lond.,** Medical Officer and Public Vaccinator for the Banwell District of the Axbridge Union.
- CLARKSON, J. B., L.R.C.P. Ed., L.R.C.S. Ed.,** late Assistant Medical Officer to the National Line *Steam Sports*, has been appointed Medical Officer to the National Line Steamship Company.
- CUMING, J., M.D. Q.U.I., F.K.Q.C.P.I.,** reappointed Physician to the Belfast Royal Hospital.
- DAY, E. J., F.C.S., M.R.C.S., L.S.A. Lond.,** Analyst for Dorchester and Bridport Boroughs, and Rural Medical Officer of Health, has been reappointed Medical Officer of Health for the Dorchester Urban Sanitary District.
- Dutton, T., M.B., L.R.C.P., &c.,** Medical Officer and Public Vaccinator to the Manhood District, Westhampnett Union.
- FAGAN, J., L.K.Q.C.P.I., F.R.C.S.I.,** reappointed Surgeon to the Belfast Royal Hospital.
- FENNELL, C. J., M.R.C.S.,** Dispenser to the Royal Hospital, Chelsea.
- FORRESTER, R. A. P., B.A., M.B., C.M.,** Senior House Surgeon to the Preston and County of Lancaster Royal Infirmary.
- HUGHES, T. W., L.F.P.S.G., L.M., L.S.A. Lond.,** Medical Officer to Tan y Bwlch, Dan Goch, Aasheton, Pant Gwyn, and Port Nijwl Mines.
- HULL, E. G., M.B., B.Ch. Dub.,** House Surgeon and Dispensary Officer to the Stockton Hospital and Dispensary, Stockton-on-Tees.
- ILDERTON, —, L.R.C.P. Ed., L.R.C.S. Ed.,** Medical Officer of Health to the Openshaw Urban Sanitary District.
- MACGIVEN, W., M.D., F.F.P.S. Glas.,** reappointed Surgeon to the Royal Infirmary, Glasgow.
- O'NEILL, H., M.D. Q.U.I., L.A.H. Dub.,** reappointed Assistant Surgeon to the Belfast Royal Hospital.
- RICHARDSON, J. N., M.B. C.S.,** second Junior House Surgeon to the Huddersfield Infirmary.
- SMITH, A. W., M.D., F.F.P.S. Glas.,** reappointed Physician to the Royal Infirmary, Glasgow.
- THOMPSON, J. A. B., M.B., M.Ch., M.D. Univ. Glas.,** Medical Officer of the Billwirth District, Towcester Union.
- WHITEHEAD, W., F.R.C.S. Ed., L.S.A. Lond.,** Surgeon to the Manchester and Salford Lock and Skin Hospital.
- ERRATUM.**—The reappointment of Mr. J. Harrison, announced in our last issue, was to the Braintree Urban District only, the Rural District being held by Mr. C. E. Abbott.

Births.

- LEAKE.**—July 22, at Pietermaritzburg, Natal, South Africa, the wife of Surgeon Leake, A. M.D., of a son.
- O'BRIEN.**—Aug. 22, at Victoria Terrace, Heavitree, near Exeter, the wife of Surgeon-Major T. M. O'Brien, A. M.D., of a daughter.
- SCOTT.**—Aug. 21, at Tower Hill Lodge, Dalkey, the wife of Dr. E. J. Scott, of a son.
- WALKER.**—Aug. 17, at Peterborough, the wife of T. J., Walker, M.D., of a son.
- WOODMAN.**—Aug. 25, at 5 Prospect Terrace, Ramsgate, the wife of Samuel Woodman, F.R.C.S., of a son.

Marriages.

- CUTFIELD—FINCHAM.**—Aug. 22, at Christ Church, Bishopsgate, Arthur Cutfield, B.A., B.Sc., M.R.C.S., late Scholar of Christ's College, Cambridge, son of the late Alfred B. Cutfield, M.D., of Deal, to Agnes Mary Hulme, daughter of the late Frederick Fincham, Esq., of Manchester.
- HAWKINS—GREEN.**—Aug. 25, at St. John's, Redland, Walter R. T. Hawkins, M.R.C.S., second son of the late Thomas Hawkins, M.R.C.S., Bristol, to Sarah Elizabeth, daughter of the late Thomas Green, M.D., of 7 Berkeley Square, Bristol.
- LUNN—NORTHOOT.**—Aug. 25, at St. Mary's Church, Ealing, John R. Lunn, L.R.C.P. Lond., M.R.C.S. E., L.S.A., Chief Medical Officer of St. Marylebone Infirmary, third son of W. J. Lunn, M.D., of Hull, to Ida Maund de P., second daughter of W. C. Northcott, M.A., of Rochester House, Little Ealing.
- MACKERN—KIDD.**—Aug. 24, at St. James's Church, Kidbrook, Blackheath, John Mackern, M.B. Cantab., second son of G. Mackern, Esq., of Buenos Ayres, to Louie, second daughter of J. Kidd, M.D., of Brooklands, Blackheath.
- PYE-SMITH—GILL.**—Aug. 20, at Charles Church, Plymouth, Rutherford, John Pye-Smith, F.R.C.S., of Sheffield, to Emily Barbara, fourth daughter of John E. Gill, of Plymouth.
- WOODHEAD—YATES.**—Aug. 17, at Kiderscroft, Peebles, German Sims Woodhead, M.D., M.R.C.P.E., Demonstrator of Pathology, University of Edinburgh, to Harriett Elizabeth St. Clair Erskine, second daughter of James Yates, Esq., of Victoria, Vancouver's Island, B.C.

Deaths.

- HAWKINS.**—July 2, at Adelaide, South Australia, Thomas Henry Hawkins, M.D., F.R.C.S., formerly of Newbury, Berks, aged 43.
- HEYK.**—Aug. 19, at the Balmoral Hotel, Edinburgh, J. C. W. Heyk, M.D., of Westbourne Terrace, Hyde Park, aged 69.
- PRALL.**—Aug. 23, at Broadstairs, Samuel Prall, M.D., F.R.C.S., of Town Malling, third son of the late Richard Prall, of Rochester, aged 43.
- SKAE.**—June 25, at Wellington, New Zealand, Frederick W. A. Skae, M.D., L.R.C.S.E., F.R.C.S.E., Commissioner in Lunacy for New Zealand, third son of the late Dr. Skae, of Morningside, Edinburgh, aged 59.

REMARKS ON SOME RECENT AND PRESENT VIEWS REGARDING FEVER IN INDIA.

By Surgeon-General C. A. GORDON, M.D., C.B., Q.H.P., &c.

(Continued from page 188.)

In 1866 the occurrence of typhoid fever was reported among the boys of the Bishop's school, at Jutog, near Simla. There were sixteen cases of the disease thus designated; these were said to have been traced to faecal poisoning of a dormitory by a latrine; active measures having reference to this assigned cause were adopted, and the school was temporarily broken up. At the same time the statement occurs that a few cases of *genuine* typhoid fever were reported at Simla, the remark regarding them made that "the occurrence of such a fever in endemic form is unusual in India."

In 1871 the following cases are reported (a) to have occurred at the stations named:—

1. *Ferozepore*.—"A recruit, who joined from England on 24th January, died on 13th February. On admission he suffered from diarrhoea; tongue dry and brownish; no characteristic spots. He progressed favourably, taking large quantities of fluid nourishment until the day before his death, when he became restless, and complained of pain; perforation of the bowel was diagnosed. After death extensive peritonitis was found, with effusion of sero-purulent matter into the abdomen; solitary glands of the lower ileum and large intestine ulcerated, most of them with a whitish disorganised core in the centre of the ulcer; the point of the perforation not discovered."

No record appears as to the general symptoms in this case nor of its causation; but there is no reason adduced to show that the disease was other than an endemic fever with intestinal complication occurring in the person of a young and newly-arrived man.

(c) Report of Sanitary Commission with the Government of India for 1874.

2. *Rawul Pindie*.—"4th August, 1871. Within the last two days a case of continued fever has presented typhoid symptoms, and is in rather a critical state. 11th.—Has had the disease changed to *enteric* fever; proved fatal last night; age 21; ill thirteen days; pneumonia of both lungs; ulceration of Peyer's patches in the lower part of the ileum; congestion of the upper part of the small intestine."

Here, again, no detail of general symptoms. The term *enteric* appears to have been applied from the circumstances of intestinal complication in a case of endemic fever; *pulmonic* would have been equally applicable, from the occurrence also of pneumonia.

3. *Peshawur*.—"23rd June, 1871. One patient, whose disease appeared to be remittent fever, died. Post-mortem examination disclosed lesions of the Peyerian patches in the lower part of the ileum; the disease was therefore changed to *enteric* fever."

No doubt the case was one of endemic fever attended, as is frequent, with intestinal complication, both due to endemic causes.

4. *Nusseerabad*.—"8th September, 1871. One death occurred during the week; the man came to the hospital with ordinary fever, but the type soon changed, and decided symptoms of *enteric* fever showed themselves. The case was a short one. At the post-mortem examination enlargement of the glands of the small intestine was observed; some were ulcerated. The subject of the case was twenty-one years of age; in India two years."

As described in the record, this case was, doubtless, one of ordinary endemic continued fever, attended by intestinal complication.

5. *Poonah*.—"26th January, 1872. One case of diarrhoea was changed to *enteric* fever; it proved fatal; age of the subject twenty-four; ill twenty-two days; ileum greatly congested throughout; several ulcers found, but none penetrative."

In these remarks there is an absence of particulars regarding systemic conditions or the grounds upon which the diagnosis in the first instance arrived at was subsequently departed from.

6. *Cannanore*.—"27th January, 1872. Two fatal cases

resulted from *enteric* fever. In one there was perforation of the ileum; in the other the gut was covered with ulcers, and much thinned."

Beyond these few remarks particulars are wanting as to the nature of this case, or the ground on which specific designation was applied to it beyond the circumstance that intestinal complication existed.

The particulars contained in these abstracts illustrate the variety in nature of cases of disease occurring among our troops in India that are now grouped under the head "enteric" fever—cases so different from each other in phenomena, and beyond the circumstance of being all the result of endemic influence, that it is difficult to perceive the affinity which justifies the application of the same specific designation. But not in India only does a similar difficulty occur in regard to cases returned under the heading "enteric" fever, as may be observed in the following transcript of cases which occurred in England, namely:—

CASE I.—Gunner, *æt.* 19, service one year. Admitted 19th September, 1875, complaining of loss of appetite, pain in head, and general malaise; temp. 103, pulse 78; tongue foul; bowels regular; ordered to bed. Pulv. Jacobi, *grs.* iv.; hyd. sub. chloride, *grs.* iv., at bed time.

20th.—No change in symptoms, but temperature slightly higher.

23rd.—Symptoms of *typhoid* fever first set in; slight diarrhoea, and gurgling over the iliac region; *no spots*; tongue furred in centre, with edges bare; pulse 112, temp. 104; ordered bismuth, *grs.* iv.; soda, *grs.* iv.; pulv. aromat., *gr.* j., every four hours.

26th.—Much better; has no diarrhoea; pulse 96, temp. 101; tongue slightly foul. Diet, milk; milk, two pints; tea, two pints.

28th.—Improving, but very weak; pulse and temp. lower than yesterday. Ordered some wine and egg.

October 1st.—Improving slowly; no diarrhoea. Cont. diet and wine and egg as before. Temp. 102.8, pulse 96; tongue foul.

3rd.—Much better; had an attack of epistaxis yesterday; bowels regular; pulse 94; skin cool; tongue very foul. Milk diet; wine, four ounces; lemonade, two pints; tea, two pints; two eggs.

5th.—Is, on the whole, better, but very weak; no diarrhoea. Ordered wine frequently; diet and extras as before.

8th.—Very much weaker, but has lost all symptoms of typhoid. Milk diet; wine, one ounce; brandy, two ounces; brandy and egg frequently, with jelly, &c. Temp. 103, pulse 94.

9th.—Is not getting any stronger; tongue still very foul; teeth covered with sordes; no diarrhoea. Milk diet; wine, ten ounces; brandy, six ounces; two eggs; two pints tea; eight ounces jelly.

10th.—Continue brandy, jelly, &c. No change since yesterday; takes his food well, but tongue continues in a very dirty state as before; pulse very weak. Continue wine, brandy, jelly, &c.

15th.—Much better, but still very weak. Continue good diet, &c. Arrowroot two ounces; wine eight ounces; brandy, six ounces; milk, one pint; jelly, eight ounces; milk diet.

21st.—Gaining strength; now able to sit up for a short time; is taking, *spt.* ammon. aromat; and tinct. cinch. comp. Chicken diet; wine, eight ounces; tea, two pints; eggs two.

31st.—Convalescent; taking no medicine. Diet, chop; wine, eight ounces; lemonade, two pints; eggs, two.

November 6th.—No change; still very weak. Ordered citrate of iron and quinine. Diet and extras as above.

12th.—Much better. Ordered varied diet, and a pint of beer daily.

20th.—Gaining strength daily. Continue citrate of quinine and iron. Varied diet; beer, one pint; lemonade, two pints.

24th.—Convalescent. Varied diet; beer and lemonade above.

December 11th.—Discharged on two months' furlough.

CASE II.—Driver, *æt.* 22; service two years. Admitted 21st September, 1875; pain in back, loss of appetite, inability to do his work. Temp. 103; pulse 90; tongue clean. His state remained unchanged till 23rd, when he first began to show signs of *typhoid*, namely, diarrhoea, characteristic tongue, gurgling in iliac fossa, very high temperature, pulse 112; ordered bismuth, soda and pulv. aromat; milk diet, and two pints of milk.

September 26th.—Very much better; temp. and pulse lower; some slight diarrhoea. Continue milk diet, and extra milk.

28th.—Continues to improve; no diarrhoea; tongue still foul; skin moist; pulse 98; temp. natural. Milk diet, &c., as before.

October 1st.—On the whole better. Covered with papular eruption; temp. 100.2; tongue foul.

3rd.—On the whole better; skin acting well; temp. 101.5; tongue clean; pulse 94; no diarrhoea. Milk diet; milk, one pint; lemonade, two pints.

8th.—Much better and stronger; in fact, convalescent. Chicken diet; wine, six ounces; lemonade, two pints; milk, one pint; two eggs.

14th.—Convalescent. No medicine. Diet and extras as above.

21st.—No change. Diet, &c., as above.

26th.—Gaining strength. Chop diet, and extras as above.

31st.—Very nearly quite well.

November 4th.—Discharged to go to his home on furlough.

CASE III.—Driver, *æt.* 21; service two years. Admitted 31st September "out of sorts," and having lost his appetite; tongue foul in centre, and clean at edges; pulse 64; temp. 99.4; bowels constipated; pain on pressing over right iliac region; no typhoid spots. To be sent to bed; no medicine.

October 3rd.—No change in symptoms. Low diet; two pints of milk.

8th.—Convalescent. Milk and diet as before.

14th.—Stronger and better every way. Chop diet.

21st.—Convalescent. Taking no medicine.

31st.—Quite strong.

November 6th.—Convalescent.

12th.—No change.

15th.—Discharged to duty.

With regard to these cases, the same difficulty is expressed as to those in India presents itself as to the precise significance of the terms *enteric* or *typhoid* as applied to them.

In 1878 an outbreak of *enteric* fever is said to have occurred among the British troops at Bareilly; 18 cases out of 32 proving fatal. The regiment attacked had only, a few months before, arrived from Malta; it consisted of the usual proportion of young men, who were thus exposed to the effects of the hot season. The records of the outbreak assign the disease to the effects of *climate* upon young and recently arrived soldiers, but explanation does not appear as to the grounds upon which the disease, thus attributed to climatic influences, received a designation indicative of specific causation of pathogenic nature. The post-mortem appearances are described as such as are found in cases of endemic fever; the mode of treatment pursued is not stated.

In the course of some remarks (a) in reports from India, we learn that in 1877 all the deaths from fever among British troops, with two exceptions, were from enteric fever. With regard to all such cases this comment occurs:—"It is quite clear from these figures, and from the remarks of the medical officers in their weekly returns, that the diagnosis between 'enteric' and continued fevers is more a question of the gravity of the individual case than of the different symptoms. Practically, in the army returns, all bad cases are now classed *enteric*

(a) P. M. G. Madras Government, Public Department, No. 1,233, dated 9th August, 1879.

fever, while the milder forms of the same disease are now classed as continued fever." The fever return referred to certainly shows some curious anomalies. It gives the admissions and deaths from fevers since 1868, and leaving out the intervening periods, the first two and the last two years of the series show the following admission and deaths, namely: In 1868-9, typhoid fever, admitted 50, died 17; continued fever, admitted 1,312, died 6; remittent fever, admitted 393, died 15; intermittent fever, admitted 2,324, died 1; total fevers, admitted 4,079, died 39. In 1876-7, typhoid fever, admitted 115, died 43; continued fever, admitted 2,952, died 5; remittent fever, admitted 48, died 2; intermittent fever, admitted 1,344, died none; total fevers admitted 4,459, died 50. From these figures it will be seen that in the last two years of the series, the facts, when compared with those of the first two years, were as follows, namely:—

	Admissions.	Deaths.
Enteric fever ...	65	26
Continued ...	1,640	1
Remittent ...	345	13
Total ...	380	11

During the first two years there were 17 deaths out of 39 reported as due to typhoid, or about 43 per cent., while during the last two years the typhoid mortality was returned at 86, or just double that of the earlier years. Of the 43 typhoid fever deaths of 1876-7, only 14 could be made up statistically from the heads of remittent and continued fevers, while there was an absolute increase of fever mortality of 11, or about 28 per cent. over the fever mortality of 1868-9. It may be asked, what are these 11 deaths due to if not to enteric fever? I (the sanitary commissioner) do not, in the least, question the pathological resemblances of Indian continued fevers to those found in typhoid in other countries, but I do not think we tend to improve our knowledge by classifying only the bad cases as enteric, and the milder as continued. (a) With regard to these particulars, the comments made by the authority to whom they were submitted (b), were that the views thus expressed change considerably the aspect of the question as to the specific nature of typhoid fever, as observed among British troops in India, this important admission being, at the same time, made,—“There is no doubt that the whole series of returns, since the commencement of the regular investigation, shows that while enteric fever deaths have increased, deaths from continued fever have fallen off.” This circumstance of itself leads to the further question proposed by the same authority, namely: “Is the continued fever of Indian returns the same disease as the ‘continued fever of home returns?’” and to the remark that “the complaint against this heading has alone been its indefiniteness for practical sanitary purposes. Is it a climatic fever in India without malarial poisoning? There is no doubt of the importance of the questions which have been raised in Madras in relation to these fevers classed as enteric; but the same difference can hardly be said to exist where post-mortem examinations have been made; practical pathologists have no difficulty in recognising the characters of fatal enteric fever there. Indeed, if no further light can be thrown upon this subject, the real question would appear to be this:—Is there such a specific fever at all? or do these post-mortem appearances take place in non-malarial fevers in India of the continued type?” The further remark occurs that “this is the question raised, and it is not quite the same one as that raised by Dr. Gordon, who appears to think that the appearances found after death are those which have always existed in fatal Indian climatic fevers of malarial character.”

(To be continued.)

SANITARY CONDITIONS OF TURKEY.

By R. B. SMITH, L.R.C.S.I., M. Col. Phys. Dublin, Surgeon to the Ottoman Army, late Russo-Turkish War.

CONSTANTINOPLE has been the envy of kings and emperors; the scene of battles and of famous sieges from that remote time, in the infancy of Europe, when Meagre founded it on seven hills, above the waters of the Thracian Bosphorus. Its prominent features—the Golden Horn, which provides a secure harbour and an emporium of commerce; the Bosphorus, with its hanging gardens, its temples, shrines, and gilded domes, its cupolas and painted minarets—have no rival upon earth. As a site upon which to build a great city, none could have been better chosen for beauty and for sanitary purposes than the group of hills on which Stamboul stands to-day, as she has stood for twenty-five centuries; and where, at no remote period, she is likely to assert again her great position amongst the leading capitals of Europe.

During the Byzantine Empire, and since the dedication of the city to Christ by Constantine, the wealth and riches of other countries and of conquered provinces have found their way by sea and land to the central city of the world. Hundreds of thousands of pounds were laid out upon walls, porticos, pillars, arches, and temples. Masterpieces of Greek art adorned the public streets, and all that wealth or artifice could procure were added to her riches, and all the skill of art and literature were summoned to her court. Innumerable statues of marble and of bronze were set up throughout the town, and we are informed that the Baths of Euxippus contained the greatest works of greatest European sculptors, along with sixty bronze statues. The public places were filled with obelisks and pillars. Theatres, palaces, temples, and three hundred and eight domes adorned Byzantium.

In those days almost all the cities of Greece cultivated medicine and science, and when Constantine became the possessor of the city, the change from a Pagan to a Christian dynasty gave a new impetus to science. In changing its soil it seems to have undergone a check in its growth, until it became acclimatised to its new atmosphere and soil.

It was often cut down, sometimes pruned and watered, by the prejudices of a rising religion, destined to sway the world for centuries and elevate man to higher civilisation. We know that dissection was held to be heretical, and that the writings of Galen and Hippocrates were the great lights during the early days of Constantinople. Oribasius wrote seventy-two medical works, was quæstor at Constantinople on several occasions, and is said to have discovered the circulation of the blood.

During the sixth century, the great plague that raged at Constantinople and carried off 10,000 persons daily was described by a physician of the day. The flourishing condition in which the Turks found medicine in after years was little appreciated by this peculiar people, who drove science and art from Turkey into Europe, giving rise to the famous Cordova School—the birth-place of modern medicine.

Bagdad resembles Byzantium in this part of its history. This celebrated Persian city was an oasis inviting the learned men of all nations with a view to the improvement of its people. But when the Turks became its captors, all science and art were swept away by them.

In the early part of its history the healing art was inseparable from religion. Leviticus lays down laws for the Jewish people, which are merely a very complete hygienic system; and Mahommed copies them for the most part, and gives them to his people in the sacred pages of the Koran. Medicine, like everything we know, is the child of circumstances, and has been influenced to no small extent by climate, and by the different forms of religion, as each successive wave swept over the world, each one raising the common level to a degree higher; and so medicine and hygiene in Mahomedan countries is subservient to their religion, and we find that in accordance

with their belief their personal hygiene is almost perfect, but that the public is deplorable everywhere through their country.

Constantinople has been likened to a dung heap by a modern traveller. The streets are seldom or never cleaned. The celebrated dogs are the only scavengers, who live on carcasses and offal left in the streets, the centre and corners of which serve as dust-pits and sewers. Everywhere are to be found quantities of decaying animal and vegetable matters exposed to the rays of the sun, and forming the point of departure of germs of disease so often fatal to thousands; and although the sea breeze mitigates the misfortune, the odours are not in harmony with the scenery.

We can all recall the appearance of the Eastern house—its irregular outline, its projecting windows covered with lattice—built of wood and plaster, as the greater portion of the capital is. It is frequently a prey to fire; whole tracts of town are often burned. The Jewish quarter—the worst in a sanitary point of view—is constantly the scene of incendiarism, which, I feel sure, have a very salutary effect.

The interior of the Turkish house is a model of cleanliness. Little furniture embarrasses the rooms; ottomans and sofas are the chief articles to be found there; and the Mussulman is very particular as to the cleanliness of his home and never enters it without changing his shoes. Nevertheless, we must acknowledge there are many important hygienic improvements necessary in relation to sewage, water-closets, and hospitals.

In public hygiene Europe is far in advance of the East; but as regards individual cleanliness and hygiene there are no people in Europe or elsewhere who can compare with the Turk, no matter what class of believer in the Koran. Had Mahommed lived in a damp, foggy climate, instead of in his dry and beautiful land, if he had resided in a large city surrounded by hundreds of thousands of people, the great prophet would have, no doubt, instituted a system adequate to the circumstances. But the very capital at the present time is destitute of public sanitary works; the placing of cemeteries outside towns, and building mosques, hospitals, and libraries on the top of hills, seems to be the only public sanitary precautions in existence in these climes.

The Turkish bath, introduced into modern Europe of late years, was known and used by the Mahomedan people for centuries. The baths are not as with us—confined to a few of our large towns, and luxuries in which none but the comparatively rich can indulge—but are to be found all over the country; and the whole population take them regularly. It appears that the Turkish woman has a peculiar liking for the bath, the physical characters of the climate and country have made her voluptuous, passionate, and impressionable to beauty and poetry. In their magnificent baths, devoid of clothing, they walk about, and recline amongst the Byzantine arcades, surrounded with all that can unite to passionate love. The shampooing and massage in these latitudes seems to be a part of the every day life, and makes a break in the "Dolce far niente" of the East. Many are the tales told of these thermae, but they have nothing to do with hygiene. It is here the famous Rhusma is employed to remove hair from the pubis.

The Turkish baby is weaned after two years. Then feeding on pure and wholesome food, dressed in loose garments (the Turkish girl wears no corsets). No new-fashioned boots deform her feet, all parts allowed to develop according to their natural laws; and so at the age of puberty the Mussulman virgin is one of the most lovely and graceful of women. In fact, the Turkish child has had all the advantages necessary for its physical development; and I believe that, whether during pregnancy or in the rearing of her offspring, even the European mother has much to learn from the Mahomedan. It is not my intention to compare our women with their Eastern sisters, either in beauty, form, temperament, or

customs; but no one can doubt that these customs are powerful factors in keeping the people free from many diseases common amongst us. And when to these we add that prostitution is unknown, and syphilis almost never met with, we need not to be astonished at the wonderful physique and enduring powers of the Turk.

When the female marries, the repose of mind together with robust health insures pregnancy, which is almost always without any of those inconveniences so frequent among our Western women. If, perchance, the function should be complicated or accompanied by any danger, there is a complete resignation to the decrees of Providence, with no doubts for the future of herself or child—doubts and fears that often hasten an otherwise remote event.

Ambition, so common among pregnant women, and the precautions taken by man and wife in order to avoid the troubles and cares of a large family, so frequent in Europe, in these climes are entirely unknown.

Women of the East have not yet learned to preserve their freshness and figure, and enjoy without interruption the enchantments and pleasures of society by giving up their offspring to the hands of mercenaries, and thereby neglecting one of the most sacred duties entrusted to woman. The Mussulman woman, to use the words of a modern writer, considers the caresses of the child she nourishes far sweeter and more agreeable than the smiles of a perfidious and corrupt world; and what many of our mothers would consider sacrifices, the Eastern mother feels to be duty and pleasure, and is more than repaid by their repose of mind, the health they preserve, and that which they transmit to their children.

It appears that the Mahomedan women cease to menstruate between the early ages of 32 and 35, or at the latest 40, after which all the signs of old age make their appearance. Here also they are less troubled by illness than our women are. Suppression of milk, abscess, &c., are very rarely met with after pregnancy.

The chronic metritis, scirrhous of breast or ovaries, polypi, cancerous ulcers of the uterus, &c., so common with us are seldom, if ever, to be found in Turkey. These facts are interesting, more especially as they seem to be a direct recompense to those who have not neglected the sacred duties of wife and mother; and although the Mussulman woman may not be handed down to posterity as the originator of any intellectual movement, nor be the subject of a biography, still we think that duties accomplished have a more healthy action, both physically and morally, upon father, mother, and children, than the ephemeral fame of the most finished woman of the world.

One might imagine that in a beautiful climate, and amongst a people free from hereditary diseases, sober, and carrying out to the letter the rules of one of the most perfect hygienic systems ever imagined, that medicine would be almost never required. Still doctors are to be found in numbers in every town. Jews, Greeks, Americans, Levantines, Europeans, have settled, especially at Stamboul, with a view to living, if not creating a fortune. In no city of the world can a man make or marr himself in a shorter time than in that on the shores of the Bosphorus.

The successful Florentine who settled at Stamboul is an example of the career of many favoured physicians to the Court. This gentleman had no great talent as a medical man, and was more of a quack than an orthodox practitioner. How many intrigues and conquests he made amongst the ladies of the Seraglio will always remain a mystery. Twice found out and twice warned, this intrepid Italian thought that he might trust to having saved the Sultan's life, during an illness, for protection, and so resumed his favourite pastime; was suspected, invited to the palace, and there the celebrated bow-string ended his days. His body was thrown in a grave-yard on the Bosphorus.

The pulmonary secretions, and those from mouth,

nose, and fauces, are imperceptible with the Turk. The same holds good for all the mucous membranes. The vapour bath plays a large part in this phenomena. Constipation may be traced to the same cause, joined to which his lazy life reacts on the liver, and so we find that organ the most frequently deranged. He dreads constipation, and thinks less than one stool per diem most dangerous; that if retained longer in the intestines, fermentations and a series of events must inevitably follow, leading down to a fatal disease.

The abuse of drastic purgatives and opium, together with temperament and an indolent life, make hæmorrhoids one of the principal diseases to which he is subject. Any attempt to stop hæmorrhage, or to eradicate the disease, is regarded as a very serious blunder; and in most cases this is the case.

Stomachica, aphrodisiacs, electuaries, are the frequent causes of dyspepsia and abdominal complaints. Being of a sanguino-bilious temperament the Turk has a tendency to develop diseases of an inflammatory character. Among the women, the customs and practices of the harem are a fruitful source of stomachic and nervous disorders. Many of these hurtful practices may be traced to polygamy.

I understand that skin diseases are very frequent among the inhabitants of Constantinople. Whether they are contracted and propagated by the Jews, who represent a part of the population—the least careful as to their personal cleanliness, or whether they have their origin among the Mussulmen, who use the vapour bath (often to excess), and live on a farinaceous diet, is difficult to decide.

The sudden changes of temperature are very marked in these latitudes. The north wind blowing from the Russian steppes, over the Black Sea, and the south wind from Egypt, over Asia Minor, reaches Constantinople by way of the Sea of Marmora; the land and sea breeze, and the hot sun, all play an important part in the formation of acute disease. The native understands the danger of these changes, and prepares himself against them. The cholera belt protects the abdomen; the turban, the head from too rapid cooling.

Dysentery, diarrhoea, bronchitis, pneumonia, are among some of the most frequent acute diseases to be met with; and antiphlogistic treatment, in its most primitive forms, appears to compose, for the most part, Turkish therapeutics. The counter-prescribing, carried on to such an extent in the British Isles and on the Continent, is the chief medical aid sought after by the population of Stamboul. The pharmacien is generally of foreign extraction, and knows, if possible, less about diagnosis, prognosis, and treatment than his *confrère* of Europe, who prescribes with such assurance for every and any form of disease; and though he may exert little influence for good on the patient, unlike our friends at home, does little harm.

The study of medicine among the Mahomedans until lately has been confined to the teaching of the Arabian physician. And it appears that they hold the same belief as Christ did in reference to many nervous disorders—namely, that they depend on an evil spirit, and are curable by sacred readings and by members of priesthood.

The statistics of Turkey—at least, so far as sanitary work is concerned—have never been taken. In fact, at Constantinople nothing is known of the rate of mortality; and this can hardly be wondered at, seeing that even among ourselves statistics often are of little value; and there remains still a great deal to be learned in this respect. Why not enforce the adoption of a principle? Were it but the first step on a long journey towards the perfection of this important science, which, when perfected, will play such a large part in breaking down lines of demarcation, and opening the route for the onward march of peoples. All that is certain is that the death-rate is very high; and may we not hope that among the reforms introduced into Asia Minor that public sanitary

work will be among the first? Closets, sewage, and all means at our disposal ought to be set on foot, in order to render the city less unhealthy.

Ilium, ancient Troy, kept watch at the mouth of the Dardanelles; New Rome guards the entrance to the Bosphorus, once the capital of the world. She may again resume her power, which, from position, she is more entitled to than any other city. Situated on the ocean highway, connecting the Black Sea with the Mediterranean, when the Sea of Azoff is connected with the Black and the Caspian Seas, when the steppes of Russia and the wastes of Mesopotamia are brought into cultivation, and the road to India leads through the Euphrates Valley, and the rich produce of Central Asia and the surrounding countries is carried down to the sea on the waters of the Danube, Dneister, Don, Ruzil, and the Irmak, and all must sail under the walls and guns of Constantinople, it will be imperative on the power that would reign supreme in Europe and Asia to be in possession of this city and its straits. Which nation this will be I will leave to your readers to conjecture.

Clinical Records.

ST. MARY'S HOSPITAL.

Stricture of the Urethra.—Insertion of No. 4 Catheter without Difficulty, and without Hæmorrhage, followed by Rigors, High Temperature, Acute Albuminuria, and an Attack of Herpes.—Recovery.

Under the care of Mr. NORTON.

THE patient, M. W., æt. 29, a fairly healthy looking man, was admitted on April 14, states he has always enjoyed good health, and has never been laid up, except with a broken leg. About twelve years ago he contracted gonorrhœa, the discharge continuing for about twelve months; in about six months afterwards he was one day unable to pass any urine; he saw a medical man who gave him some medicine which relieved him, and he afterwards continued to pass his urine in a fair stream until about twelve months ago, when he again contracted gonorrhœa, and the stream afterwards became diminished.

On the 2nd May a No. 3 silver catheter was passed, then a No. 4 catheter was passed with some difficulty, and twenty-four ounces of urine drawn off. Ordered—

Mag. sulph., gr. xx;
Pot. bicarb., gr. xx;
Tr. hyoscyami, ʒj;
Aq. carini, ʒj. t. d. s.

On the 3rd, at 11 p.m., the patient had a rigor, with temperature 102°6.

4th.—Another rigor at 5.30. Temp. 105.

9 a.m., 105.
10 a.m., 105.
11 a.m., 103°2.
12 a.m., 105.
1 p.m., 103°2.
2 p.m., 102°4.
3 p.m., 102°8.
4 p.m., 102°6.

Was ordered a tepid bath.

5 p.m., after bath, 100°2.
6 p.m., 100.
7 p.m., 99°4.
8 p.m., 97.

Patient, listless; sick; pulse imperceptible; tongue, coated. Ordered thirty drops of tr. opil.

5th.—Pulse very weak; hands twitch convulsively now and then. Passed only six ounces of water last night. Sick several times in night; continually hiccupping came on for the first time in the night. Ordered—

Mist. pot. effervescentes, ʒj. tertius horis 8.

Urine acid, thick—albumen about ¼. Was dry cupped over kidney. Brandy, ʒvj.

6th.—Patient feels a little better to-day. Still continually hiccupping, and was sick up till 5 p.m., but was not sick at night. Temp. this morning 97°6. Right side of nose is

swelled this morning, also right eye. Slept a little better last night. Urine, $\frac{1}{2}$ albumen, thick, acid.

R. Vini ipecac. $\mathcal{M}\text{ij}$;
Acidi hydrocyanic dil., $\mathcal{M}\text{ij}$;
Aq., $\mathcal{Z}\text{j}$.

Every half hour.

7th.—This morning a herpetic eruption broke out over his face and neck—there was a patch on the forehead, both sides of nose, and right cheek, and under right lower eyelid, also a patch in front of neck, and one on back of neck; there is also a small patch about the size of a halfpenny just above right clavicle to the inner side. The eruption was dusted over with oxide of zinc. Urine acid, trace of albumen, thick. Temp. a.m., 99.2—p.m., 98.6.

8th.—Temp. a.m., 99.6; p.m., 99.8.

10th.—Patient feels much better to-day, does not feel any pain anywhere. Says he should like to have more to eat. The eruption is getting better, forming into scabs. Pulse, 72, regular. Tongue red and raw at tip, not so on dorsum. Passed a good night. Temp. 98.

11th.—Urine 1023, neutral, trace of albumen.

12th.—Temp. 98.4.

24th.—Patient has been gradually improving. There is a little scalding on passing water, and a yellowish discharge from urethra, which patient thinks has increased since the eruption came on face. Urine sp.g. 1020, pale, cloudy, acid, about 1.20 albumen. Patient got up yesterday for first time. Feels weak, bowels open. The stream is larger and freer, not forked.

27th.—No catheter passed, stream sufficiently large to empty bladder without trouble, but still evidence of great constriction. The patient was retained in the hospital until albumen had entirely disappeared from the urine, the 12th of June. It was not considered advisable to insert another catheter.

Special.

SOME RECENT REPORTS ON FEVER.

MELTON MOWBRAY.—(Estimated population 5,030.)—In 1879 fever was present in this town. In 1880 the occurrence took place in April, of what subsequently developed into an epidemic of that disease. The origin of the outbreak was believed to have been attended by circumstances which pointed to infection away from the town, and to the probable medium of diffusion being water and milk. Facts suggested the possibility that three cases detailed were due either to the air of the privy, or that of the sewer; although there was no evidence of either privy or sewer having been specifically infected. No communication between infected families was traced. A particular family, consisting of a man, his wife, three children, and a servant, lived in a house near a privy. The man was specially intolerant of odours therefrom; he had fever, but no other member of the family suffered from it. Of another family and employes living together one young lady only was affected. The vicinity of a closet was looked upon as an element of danger to all; yet the lady affected was not peculiarly exposed to its influence. Beyond the fact that the infected houses (and they widely apart) communicated with the same sewer, there was no ground for suspecting any particular condition as being specially implicated in the causation of fever. It is described as possible that the case of a lady (ill in July) may have been due to sewer gas; the same circumstance would seem to have had a special bearing on the outbreak which followed in the first week of August. On three or four occasions fever occurred simultaneously in several streets. The families affected obtained their water and milk from sources without community between them, but grave suspicion rested upon sewer air as being mainly concerned in the spread of the disease—this suspicion supported by the circumstance that, as regards thirty-two of thirty-six families

the drains were untrapped; of three families outside the infected area in which the fever occurred, the persons affected had visited relatives in the affected localities. A sudden increase in the cases of fever was observed to occur at intervals of a week to a fortnight, after heavy floods, and these took place at intervals from July 14th to October 8th, that is, during the summer and autumn seasons; no further case happened after the month of October. The evacuations of a patient with fever having, early in July, been disposed of in a water-closet, it is assumed that "the air in the sewer must have become more intensely poisonous," and that it must have done so for a longer distance upwards.

In *Ashfordby Road*, about a mile from Melton Mowbray, four families out of seven suffered from fever in some of their members. Defects existed in the wells used by those affected, and by some of those who did not suffer. Near all seven houses there was an offensive manure heap. The introduction of the fever would appear to be due to a man who arrived from Melton Mowbray about the end of August, and went to lodge in one of the cottages. This man was either suffering from diarrhoea at the date of arrival, or was attacked within a day or two of his arrival; the occupants of the house he had left suffered in the same way, and these circumstances excited the suspicion that his illness was enteric fever. Between the 24th of September and 3rd of October five persons became ill with fever. The only cause of the attack in them would seem to have been the privy which had been made use of by him. For the spread of the disease among the other three families, there was good ground for suspecting the drinking water to have been implicated.

UCKFIELD.—(Population of the village 2,000; of the parish 2,400.)—Until twenty-five years ago there were no sewers; drainage was to cess-pools, street-channels, and water-courses. Now most houses are connected with sewers, the private drains being in an unsafe state. During floods it is feared that by means of the rain spouts the sewers ventilate generally into the closets and dwellings. The water-supply is from wells sunk in sandstone rock to a depth of forty to sixty feet. From percolation through the upper soil it is considered doubtful whether the supply of many is to be trusted as wholesome. Excavations still reveal the existence of old drains and cess-pools. Until 1879 Uckfield was singularly free from enteric fever; cases when they did occur did not spread. In September, 1880, four persons, apart from each other, were nearly simultaneously attacked. Nothing is certainly known respecting the source of infection in these cases. In October there occurred 4, in November 2, in December 3 cases. In January there was a rapid increase of the disease; in February the outbreak culminated, there having occurred in these two months twenty cases. In March the disease declined; in April no case occurred. Throughout the entire outbreak there were thirty-eight cases and five deaths. Whatever caused the first series of cases, those of January and February were due, as seemed quite clear, to infection; nor is there need for surprise at the result in a town possessing in its water-supply and sewerage arrangements unusual facilities for the spread of the disease material of enteric fever. Probably specific infection of more than one well occurred during the winter. Here "is history of autumnal enteric fever, unfertile at first, under circumstances seemingly conducive to its fatality; but suddenly, in a particular season, developing reproductive powers to be, in a subsequent season, maintained with widely increased range.

BRIDLINGTON.—(Estimated population 8,321.) The inhabitants chiefly of the agricultural classes; the old town supplied with drains and sewers since 1857-60; the quay only

furnished with cess-pools; the sewage from the former discharged into the harbour. *Water*, supplied by a company, is derived from a deep well in the chalk. A tidal spring at the quay is partly used by people near it. According to tables given, fever had, since 1873, occurred in an occasional case, but not exceeding 4 per annum, in Bridlington Sanitary District; and in St. Mary's there was no special outbreak of the disease till 1880; in that year 34 deaths by it occurred in the former and 29 in the latter; at the quay, however, only five cases occurred, against three in the year immediately preceding. In fact, the average death-rate by fever throughout Bridlington during the seven years preceding was 0.40 per 1,000, against 0.46 for England and Wales. Of thirty-four cases the disease was described as *typhoid fever* in thirty-three; in the exception the cause of death was described as "continued fever with secondary bronchitis;" the case occurred, however, associated with others of typhoid fever. Two deaths occurred in the first quarter, one in the second, two in the third, and 29 in the fourth; of the latter, 13 in October, nine in November, seven in December—these deaths, in 160 cases, occurring in 87 houses. In February and March, 1880, a group of cases occurred in the market-place; their origin could not be traced. In August the first of what became a series was attributed to a bad smell from a ditch. In September and first half of October, a large number of persons, distant from each other, were simultaneously (or nearly so) attacked. The great majority of these obtained their supply of milk from a particular dealer. A street of low houses north of the Priory Church escaped. The water of a well connected with the suspected dairy was declared *very bad*, and as largely contaminated with sewage. A girl, twelve years of age, who lived in the house was attacked, as two of her brothers had been shortly before, with fever; three cases had also occurred in the house adjoining in it. It is thus *very possible* that in some way specific infectious matter may have gained access to the well. The water was used only after being boiled for rinsing the cans; the cows drank it, but none of them were in ill health at the time of the outbreak. As to the milk, different opinions were given of its quality. Of 83 households supplied with milk from this dairy, 48 were attacked; the number that escaped must therefore have been 35. Some persons attacked had drunk milk freely, others only in tea or coffee, others not at all; on the other hand, some who had drunk it freely, escaped. The origin of the epidemic had been the subject of keen local debate. The opponents of the sewage theory seized eagerly upon the milk hypothesis, and the converse. For several weeks the fever was confined to a *low-lying, undrained* locality; afterwards the cases spread. Although sanitary defects existed in many of the houses affected, this was not the case in all. The epidemic declined speedily after its cause had been ascertained, and means of prevention adopted. Besides the milk, there is reason to think that in many cases unwholesome conditions have aggravated individual attacks, and facilitated transmission of the disease. There were many instances in which relatives and attendants on the sick contracted the disease. During the autumn infantile diarrhoea was prevalent.

CHORLEY.—(Population 19,472, chiefly low Irish.) Situated on the coal measures. Many of the houses badly constructed. Since 1878 scarlet fever, typhus, enteric, and "other and doubtful kinds" of fever have prevailed to a greater or less extent. Thus, scarlet fever, by which only one death occurred in the first-named year, increased as regards mortality to 49 in 1879, diminished in 1880 to 16, and in the first quarter of 1881 caused two deaths. The single death by typhus occurred in 1879. Taking the yearly periods, as here given, in their

succession, the deaths by enteric fever were 9, 8, 9, 3; by other and doubtful kinds 1, 16, 14, 1.

As regards *scarlet fever*, the prevalence of that disease in 1879 was part of the epidemic which overspread Lancashire in 1878-9. Of the mode in which the disease was propagated little can be said except that it appeared to be by personal intercommunication.

Other or Doubtful Fevers.—Of 32 cases returned under this head, 24 occurred in children under five years of age. The greater number of the whole certified as *continued fever*, or *simply fever*. Several occurred in houses where, at the same time, there were cases of scarlet fever; in others the fever was *probably not* specific infectious. The death by typhus was that of a pauper in the workhouse infirmary.

Enteric Fever.—Fifty cases, twelve fatal, from the beginning of 1880 to April, 1881. Cases distributed in groups and localities, occurring at various periods. As regards the origin and propagation of the disease, inquiries in many cases failed to elicit satisfactory evidence. There is no reason to suspect the water-supply, and the milk was obtained from various sources. The scattered distribution of the typhoid cases negatives the idea of any common simultaneous cause. It seems most probable that the morbid poison was conveyed by the medium of sewer air. Yet Chorley is provided with a complete system of sewers, except at Cowling; there an outbreak of typhoid fever occurred four or five years ago, but no record of such on the present occasion. House-drains have all been laid according to approved plans; water from the Water-works Company.

FRANCE.

[FROM OUR SPECIAL CORRESPONDENT.]

PRIZE DISTRIBUTION AT THE ACADEMIE DE MEDECINE.—A whole sitting was entirely devoted to the distribution of prizes to the successful competitors in the question previously issued by the Academie. The awards were as costly as they were numerous. Several gold medals were granted, while a hundred silver medals were given to those who reported a large number of successful vaccinations. Money prizes were also granted in certain subjects. One prize of £280 was offered for the best work on the treatment of those diseases which are recognised to be almost incurable as hydrophobia, cancer, epilepsy, cholera morbus, &c. Eleven competed, but none of the memoirs were considered to come up to the standard.

GOITRE.—At the Société de Chirurgie M. Tillaux reported the case of a patient on whom he operated for goitre, and without chloroform. Two incisions were made along the anterior border of each sterno-mastoid muscle, and were united at their inferior extremity by a transverse incision. A difficulty consists in how to know when really the envelope of the thyroid body is reached, so that it is always necessary to proceed layer by layer until the envelope is properly exposed. Moreover, four large arteries offer another difficulty, to avoid which it is best at once enucleate the tumour by passing the fingers behind and moving it a little to one side, the arteries can be seen and torsion performed with facility. The operation performed, M. Tillaux closed the wound, leaving a drainage tube *in situ*. The cure was completed in a few days. An examination of the tumour showed that it was a sarcoma. M. le Dentu believed that sarcoma was more frequent than was considered. Compression alone by a tumour of the thyroid body can simulate an exophthalmic goitre. Professor Rose, of Zurich, was the first who practised thyroidectomy. He practised tracheotomy before extirpating the goitre. According to Rose the diagnosis of malignant tumours of the thyroid body is always very difficult. Thus he never touches a thyroid gland which appears to be affected with cancerous degeneration. M. Tillaux considered that when a tumour covered all the anterior region of the neck tracheotomy was impossible.

SEROUS DIARRHŒA OF CHILDREN.—Salicylate of lime has

been recommended in the serous diarrhoea of children. From three to five grains are given every two or three hours. After ten or twelve doses the evacuations are changed, and the vomiting that generally accompanies this class of diarrhoea ceases immediately the agent commences to produce its effects. Salicylate of lime does not appear to have any appreciable influence on the other forms of intestinal flux.

ACUTE ARTICULAR RHEUMATISM.—Dr. Lingi, an Italian, formulates as follows the conditions in the treatment of acute articular rheumatism according to its causes and manifestations. Salicylate of soda is indicated in cases of polyarticular rheumatism when the articular phenomena are very pronounced. Quinine is the best agent and the most rapid when malaria may be suspected as having some influence in provoking the affection. Benzoic acid or benzoate of soda should be given when there were nephritic complications. Topical treatment, as blisters, &c., give the best results when the affection is confined to one articulation. An Italian *confrère* gives as counter indications to the employment of salicylate of soda grave affections of the heart, persistent gastric disturbance and renal complications, not because the salt could produce a nephritis, but because it appears to aggravate renal diseases.

CAMPHOR AND HYDRATE OF CHLORAL.—M. Simons having observed a case of poisoning by a mixture composed of equal parts of camphor and hydrate of chloral, conceived the idea of employing the same preparation in therapeutic doses. Twenty drops of this mixture in a draught cut short an attack of acute mania. M. Simons believes that it could be employed with good results in hydrophobia, tetanus, and delirium tremens.

CÆSARIAN OPERATION.—Upon 379 cases in which the Cæsarian operation was practised after death, 308 children were taken out dead, 37 gave signs of life, and 34 were extracted alive, 5 of which lived to a good age. Garecki, a Belgian, has made experiments upon animals to find out the length of time a child lived after the death of the mother. His conclusions are as follows:—It is not doubtful that a child can live after the sudden death of the mother; the extraction of a living foetus is probable if it be done during the first six minutes which follow the death of the mother; it is still possible to recall to life children extracted six or ten minutes after the death, in spite of the asphyxiation; it is not impossible to save them after from ten to twenty-six minutes; after the foetus is already asphyxiated after the first minute; the death of the mother by rapid intoxication is more favourable to the child than death due to other causes.

THE BULLET DETECTOR USED IN PRESIDENT GARFIELD'S CASE.

A REPORT upon the ingenious instrument devised by Professor Bell for detecting the location of the bullet in President Garfield's wound is given in a recent issue of the *Philadelphia Medical Reporter*. The instrument as now modified, though not essentially new in principle, is more sensitive to small masses of metal at a distance, and better adapted to the requirements of military surgery than anything of the kind hitherto devised. The apparatus, in its present improved form, consists of two flat coils, about four inches in diameter and half an inch in thickness, of insulated copper wire; a battery, a condenser, an interrupter or circuit breaker, and a telephone. The ends of the primary or inducing coil are connected with the poles of the battery, and in the same circuit are a condenser and a small interrupter, whose vibrating tongue opens and closes the circuit with great rapidity. The ends of the secondary coil, in which the current is to be induced are carried to the binding posts of a Bell telephone. When the connections have thus all been made, the secondary coil is laid on the primary or inducing coil, so that their respective circumferences exactly coincide. The circuit breaker is then set in motion, and the rapidly interrupted current through the primary coil induces another current of higher intensity in the secondary coil, and, as it does so, a loud musical tone is heard in the telephone with which the secondary coil is connected. As long as the current is maintained and the circumferences of the two coils are kept in exact coincidence, the musical note in the telephone does not change its pitch or intensity. If, however, the experimenter slides the upper coil along an inch or so upon the corner, so that their circumferences no longer correspond, the intensity of the musical tone is diminished, and just in proportion as the centres of the flat coils are separated by a greater or less distance the intensity of the musical tone is lessened or increased. When the upper coil has been slid over the lower, so that they simply overlap, the centre of one corresponding nearly with

a point in the circumference in the other, the musical tone in the telephone ceases. If the upper coil be pushed a little further to one side, so that it overlaps still less, the tone is again heard. By delicate manipulation it is possible to adjust the centres of the overlapping coils at such a distance one from the other, that a perfect balance is brought about, and when this is the case, the telephone makes no sound whatever. The centres of the overlapping coils cannot then be moved either toward or away from one another without causing the telephone to break its silence.

When the coils are thus balanced and the telephone is mute, it is found that what may be called the area of coincidence, or, in other words, the area of the overlapping parts of the two flat coils has become highly sensitive to the approach of metal, and manifests its sentiments by a low note in the telephone. As long as metal is kept away from this area the telephone remains silent, but if a piece of lead, for example, is brought within a distance of four or five inches from the overlapping parts of the coil, there may be heard in the telephone a faint but clearly perceptible note, which becomes louder and louder as the metal approaches the sensitive surface, and throws the coils more and more out of balance. It will readily be seen that under the guidance of the telephone, the small area bounded by the intersecting circumferences of the overlapping coils, can be placed exactly above a bullet or other piece of metal embedded in the body, provided the metal does not lie at too great a depth. As soon as the balanced coils begin to feel the disturbance caused by their approach to the embedded bullet, the telephone announces the fact by a faint continuous musical note, and this note grows louder and louder until the overlapping parts of the coil are directly above the disturbing metal, when the sound reaches its maximum. For convenience of application to the body the coils used by Professor Bell were mounted in a rectangular piece of walnut, about seven inches in length by four in breadth, with screw posts at the corners for the wires and a handle at the back, by which it could be held.

The apparatus audibly and unmistakably detected the presence of a leaden bullet held at a distance of $3\frac{1}{2}$ inches from the sensitive area of the secondary coil, this being a half inch beyond the distance which Professor Bell set himself the task to attain. Even greater though less pronounced results have been attained; a bullet disclosing its presence in one experiment at a distance of five inches. In this experiment a curious fact was noticed. At a distance of $3\frac{1}{2}$ inches or less, the fundamental musical tone of the vibrator was conveyed through the telephone to the ear of the operator. But when five inches distance was reached, the resultant tones were two octaves or more higher than those of the vibrations. Thus, in some mysterious manner, the laws of harmony are found to be related to those of electricity, and may in the future play a not unimportant part as an auxiliary to the work of practical surgery.

An old soldier who was shot in the breast in the war of the Rebellion, and who still carries the bullet in his person, was made the subject of experiments, and the presence of the metal below the shoulder blade was made distinctly audible.

THE Linacre Professorship of Physiology at Oxford, vacant by the death of Dr. Rolleston, will not be filled up until November next, by the first day of which month candidates are required to send in their names and testimonials. The professor is elected by the Visitor of Merton College (the Archbishop of Canterbury), the Warden of Merton College (the Hon. G. C. Brodrick), the Presidents of the College of Physicians (Sir W. Jenner, Bart.), the College of Surgeons (Mr. Erasmus Wilson), and the Royal Society (Mr. Spottiswoode).

THE Registrar of the Branch Medical Council for Ireland has erased from the "Medical Register," during the month of August, twenty-five names of persons, nine of whom have died, and sixteen of whom—having received the statutory notices under the Medical Act—have given no reply.

A NEW Infectious Disease Hospital has just been opened at Ipswich. The building can, on an emergency, accommodate thirty patients, besides affording facilities for the addition of huts.

THE BRISTOWE - HUTCHINSON ORATIONS
ON HOMŒOPATHIC FRATERNISATION.

We notice with great satisfaction that both the President of the Council and the editor of the *Journal of the British Medical Association* have made a public and unmistakable repudiation of the advice offered by the orators on medicine and on surgery at the recent meeting of the Association at Ryde. In the last issue of the *British Medical Journal* the President (Mr. Wheelhouse) says:—

“As President of the Council, I feel it incumbent upon me to stand forward and say that, neither directly nor indirectly, had any (of the sentiments of the addresses) ‘inspiration’ been for a moment thought of by the Committee of Council, and to declare my conviction that, up to the moment of their delivery, no member of that committee had the faintest idea that either Dr. Bristowe or Mr. Hutchinson was about so much as even to touch upon the question either of homœopathy or of homœopathsists.

“That they should have done so, and have thereby even seemed to pledge the Association to any particular line of thought, is no doubt to be regretted; but I claim to be permitted, on the part of the executive of the Association, to repudiate the insinuation that we are in any way responsible for the views enunciated by our readers.”

To this official statement the editor adds the following comments:—

“Greatly as we may admire, and amply as we are prepared to do justice to the courage and sincerity of the orators, we must express the opinion that, in departing from the traditions attaching to their office, and in introducing burning and controversial arguments upon ethical subjects into a scientific address delivered from a post allotted to them by the Association, the readers of addresses in medicine and surgery were not judicious; and we may also express the hope that what they have done will not be made a precedent in the future.

“On the whole, and speaking with only a general knowledge of the opinions which have always been held by the official bodies of this Association, and by all the leading members with whom we have personal communication, we feel no hesitation in saying, that the Committee of Council will not accept the view suggested by the readers of addresses. In suggesting these views, they acted conscientiously and honourably upon their own personal opinions; they were not, we believe altogether wise in selecting that opportunity of expressing those opinions. Certainly, they spoke with no other than their own individual authority, and their opinions cannot be accepted as in any way expressing official views.”

These utterances on behalf of the Association and the profession are, we repeat, gratifying and conclusive, and, if endorsed officially by a formal resolution of the Council or Committee of Council specially called for the purpose, they will have all the value of a public professional protest against the tenets of Dr. Bristowe and Mr. Hutchinson. These gentlemen’s leanings towards homœopathy will—in that case—not be liable to be advertised as a wholesale recantation of the censure of condemnation against homœopathy, and we shall be satisfied to leave the champions of fraternisation to the enjoyment of the company of the consultants whom they have selected.

But we cannot allow it to be said the outcry which has been raised by the *Lancet* and the *Medical Press* has been lacking in “benevolence or ingenuousness of suggestion.” Nor can we doubt that there was good reason for those who represent the profession apart from the Association to demand that fraternisation should be at once, definitely and publicly, repudiated by the official speakers of the Association. On the day on which these remarks are published to our readers, an entire month will have elapsed since the invitation to take homœopathy to our embrace was uttered at Ryde, and in that interval three issues of the official organ of the Association have appeared, none of which have contained a syllable of protest—repudiation—or regret for the words spoken either from the editor or the executive officers of the organisation. We submit that this silence was sufficient reason—in view of the improbability that the public orators would have adopted themes or uttered sentiments which they expected would be distasteful to those for whom they spoke—for our apprehension that the Council of the Association was more or less privy to or in accord with those sentiments. We are glad to have reason to believe that we were mistaken, and we shall be pleased to have that impression converted into certainty by an immediate official pronouncement on the part of the Council.

PROVINCIAL HOSPITAL TEACHING IN IRELAND.

IN anticipation of the framing of medico-educational requirements for the Royal Irish University, a movement was early in this year originated by Dr. Laffan, of Cashel, having for its object the recognition of Irish Union Hospitals as centres of clinical teaching. Dr. Laffan's views have been many times set forth in the correspondence columns of this journal, and, having secured the hearty co-operation of many of the workhouse surgeons of Ireland, he has been in official communication with the Senate of the University, and has submitted to that body his arguments on the subject.

The question as to how far it may be possible for licensing bodies to accept certificates of hospital study from provincial hospitals has also been brought into prominence by the new scheme of education and examination adopted recently by the Irish College of Surgeons. That scheme is so framed that it will be possible for the student, during the first of his four years—the period devoted to “preliminary scientific” work—to pursue his study without coming to Dublin or any other teaching centre. At the end of that year he will be required to answer *inter alia* upon osteology and practical pharmacy, and it is anticipated that he will obtain instruction in these subjects by the joint agency of books and of the local medical practitioner. If it were possible to overcome the difficulties to which we shall presently refer, the student might also be allowed, during this year, to make a beginning in hospital work, and to receive credit in his curriculum for a modicum of clinical study at this period; and we note that the Irish College of Surgeons has already recognised provincial hospital teaching to the following limited extent:—

“Candidates for letters testimonial who have attended metropolitan hospitals during three winter sessions of *six months* each, shall be considered to have performed sufficient hospital attendance if they shall be able to produce certificates of regular daily attendance during a like number of months at a county infirmary, or provincial surgical hospital containing at least fifty beds, provided the surgeons of such infirmaries or hospitals shall make returns to this College, in the months of May and November in each year, of the names of students so attending.”

We willingly concede to Dr. Laffan the admission that it is desirable that students should have liberty to study at any hospital which may suit their convenience, so long as the instruction given is *bona fide* and sufficient; but it is obvious that extreme difficulty exists in ensuring the honesty and reality of such teaching. The hospitals which are now recognised as centres of instruction are subject to inspection by the Colleges, and in fact, undergo a constant though unofficial supervision by the eyes of the large number of surgeons and students who pass daily through their wards. But it is by no means to be assumed that hospitals whose functions are not, as these are, performed under the public gaze shall be equally accepted as teaching institutions. Dr. Laffan asks the licensing bodies to accept the certificates issued by 163 workhouse hospitals and 30 county infirmaries in Ireland, and we have inquired what guarantee he can give to the Colleges that those cer-

ificates will represent any useful teaching whatever? To this question he replies in the following letter:—

SIR,—The Licensing Bodies will be afforded the amplest means, through the medium of their examinations, for testing the *bona fides* of the teaching of union hospitals; they employ no other means for testing the *bona fides* of Dublin teaching. It is true that they could visit the hospitals, but do they do so? I never heard of any such visitation, though I suppose you cannot but be aware that a great many Dublin hospitals stood in need of such up to the date of the introduction of clinical examinations. It may be alleged, in the interest of monopoly, that students imperfectly trained at Union Hospitals may possibly balk the scrutinising tests of examiners by drinking more deeply than the non-country student of the metropolitan draught during the time that their studies would lie there; but if this should be found practicable (which I doubt), the fact cannot escape the observation of their clinical teachers, of their brother students, and (not less important) of themselves. Once their imperfect training is noted—and it must be so at once—there will be an end to union hospitals getting pupils. It may be seen from all this that public opinion will afford the same protection (whatever that may be worth) to country as well as to town students.

Lastly, the Fellows will inspect hospitals, and I sincerely hope they will commence with inspecting Dublin ones. I may add, in conclusion, that, to silence all cavilling, we have no objection to recognition by results, which, we hope, will be extended to all hospitals.

THOMAS LAFFAN.

We do not consider this reply quite satisfactory. Licensing bodies will, no doubt, test the student by examination, but they will do the same for students who have not attended a provincial hospital at all; so that the examination would be only an indirect and unsatisfactory test of the clinical teaching. As inspection of the hospital is out of the question, and would be of little value if it could be carried out, it seems to us that the surgical teaching of provincial hospitals could only be received upon the principle of “recognition by results.” If this sort of teaching were confined to a particular year of study, if a regular account of the number of students of each hospital, passed or rejected, in that year were kept, and if a rigid rule were enforced that an hospital, whose unsuccessful pupils exceeded a certain percentage of the whole, should be refused a continuance of recognition, we think that the test might be sufficient to ensure to the student the worth of his time and money in instruction. We await some such practical proposal from the promoters of Union Hospital recognition, but until we are in possession of such a suggestion, we must continue to regard their hopes as altogether incapable of realisation.

JUDICIAL INCONSISTENCY AT THE LATE EXHIBITION.

MESSRS. BURROUGHS, WELLCOME & Co., the wholesale druggists, have sent us a lengthy communication, dealing with the awards made in connection with the recent Medico-Sanitary Exhibition at South Kensington, and exposing so many and serious inconsistencies that we cannot, in justice to them, refuse it an exhaustive consideration. From the nature of the undertaking, and the conditions by which it was regulated, it was to be anticipated that disappointment would be occasioned to some, at least, of the many firms exhibiting samples of their manufactures. In competition with other products of the same description, a proportion only of the goods

in each class could hope for favourable notice from the judges, the duty of these latter functionaries being that of selecting the most deserving articles for the distinguishing mark of their approval. Under ordinary circumstances, this form of proceeding results satisfactorily, and, indeed, it must always do so where a competent jury discharges its duties with a conscientious regard only to that which is, for the time being, its sole concern, the merit, viz., of the exhibits adjudicated upon. It is, however, with a feeling of much regret that, after having carefully perused the letter sent to us by Messrs. Burroughs and Wellcome, we are compelled to conclude that the complaint they embody therein, to the effect that their exhibits have been unduly neglected, is not altogether without foundation. We do not care to discuss the question raised by them, whether the fact that the majority of the articles shown by them are of American manufacture, can be taken as a reason for the course pursued by the judges; we prefer to believe that every improvement in pharmacy is an acceptable offering to the medical profession, and that the verdict passed on new drugs, and new preparations, is based on the legitimate claims they possess to be ranked as improvements in the resources of the physician. It is a matter of no importance to the practitioner by whom or whence the drugs he prescribes are provided; his first consideration is the efficacy of his prescription, and inventors everywhere may rest assured that a hearty and honest recognition will be given by English practitioners to all those improvements which stand the test of fair experiment. With this conviction, strong upon us then, we confess to a feeling of astonishment, that Messrs. Burroughs and Wellcome are able to complain that a long list of the preparations for which they act as agents, have failed to obtain any award at the hands of the judges in the drug section of the late Exhibition. Many of these preparations, too, are among the most widely used, and most widely commended of drugs in daily use in this country, and in the case of certain exhibits especially, does their omission from the list of awards, taken together with the universal encomiums previously passed on their merits both publicly and privately, appear in the light of an inscrutable mystery. We do not propose to enumerate all the instances detailed in the letter referred to, but it is necessary to name a few of the most prominent articles in order to enforce the statements we venture to make. In the class of "pills," there are probably very few improvements that have attained such wide and speedy recognition in the profession as the beautiful ovoid, capuled pills of McKesson and Robbin, of New York, and introduced to this country through Messrs. Burroughs & Co. It would be ridiculous to pretend that these pills are unworthy to be noticed by the side of many exhibited at the same time by other manufacturers, and yet we are informed that from them alone was any award withheld, every other pill, of whatever kind, being favourably and specially noticed by the judges. Similarly with the well-known "Kepler" Malt Extract, the sterling qualities of which have ensured for it very general employment by the members of the profession here, but which alone, of all the malt extracts exhibited, failed to obtain the good word of the judges. In this

instance, too, the fact that every other similar article received an award, while some, at least, are markedly inferior in every respect to the "Kepler" variety, emphasises, in a most unpleasant manner, an oversight that ought never to have been committed. We say this with a desire to put the best possible construction on what has occurred, and with the feeling that only by so accounting for it can we avoid a more unpleasant conclusion—a conclusion, which once entertained, would effectually destroy any permanent benefit resulting from the exhibition.

We will refer only, in addition, to the compressed hypodermic tablets invented by Messrs. Wyeth, Bros., and the importance of which is already proved to be far above any mere judicial recognition of them, and which, notwithstanding, have with the other incomparable improvements in pharmaceutical preparations of iron, &c., received the lowest award in the power of the judges to bestow. Of less noteworthy importance, perhaps, is the ignoring of such articles as Hazeline, which is obtaining much favour in general practice, or of special improvements in apparatus as applied to manufacturing pharmacy, and of which several were shown by Messrs. Burroughs and Wellcome; but viewed in the light cast on it by the all but total neglect with which their stall was regarded, we cannot but think the protest they have uttered as justifiable and reasonable.

We have, however, a graver charge to bring against the judges, and one, too, which must be equally shared by the exhibition committee; one, also, from which it will be difficult to exonerate them. It is that they have together been guilty, not only of admitting to the exhibition, but also of sanctioning the award of certificates to articles which cannot by any extension of proper regulations be included among legitimate pharmaceutical preparations. We refer to certain quack medicines, and secret nostrums, which we were in truth amazed to find exhibited at all, but which it could never have been supposed would meet with approving recognition from a jury composed of well-known medical men and pharmacists. Among the things we allude to are "the Infallible Worm Specific," and "the Marvelous Oriental Balsam, specially recommended to ladies for those imperfections and blemishes in the fair sex caused by the wear and tear of time." That such wholly objectionable and mischievous articles should be admitted into a collection of exhibits organised by a committee of men eminent for their scientific attainments and professional integrity is sufficiently astonishing; but that the additional insult of classing them for reward with actual pharmaceutical preparations should have been committed, is one of those curious occurrences which it is impossible to explain in the absence of all clue to its real meaning. It cannot even be pretended that judgment was passed on them from knowledge, since by their nature, in common with all quack medicines as secret remedies, their composition was unknown to the judges; and, in the absence of actual trial of their merits, either a "lady's balm" or a "worm cure" could offer little inducement to exact the approval of a scientific juror.

The whole proceeding as regards Messrs. Burroughs

and Wellcome is one that they may very justly demand some explanation of; and, apart from the personal element thus introduced, we feel that we, in the interest of professional medicine, are likewise justified in demanding a defence of their action from the members of the jury of the drug section. Unless some authoritative denial is given to the dictum by which secret remedies have been stamped with the high approval of an award at the most important exhibition ever held in connection with legitimate medicine, we cannot hope to stand in future against the charge that will be urged of giving official recognition to what is deemed the worst act of which a professional man can be guilty. Messrs. Burroughs and Wellcome and the houses represented by them, can rest contented on the assurance that the wider judgment of the profession is emphatically opposed to that passed by the jury of the drug section on their exhibits. But, nevertheless, we trust they will not rest contented with this vindication only, but in their own and other interests will insist on what they have every right to demand, a full explanation of the inconsistencies of which they very fairly make complaint.

THEORY IN RELATION TO CERTAIN OUTBREAKS OF ZYMOTIC DISEASES.

In another column there is given, as fairly as is possible, an abstract of some reports recently submitted with regard to the occurrence of specific forms of fever in certain places. The ostensible object in view by the writers of those reports, has evidently been to connect the outbreaks in question with two circumstances alone, to the exclusion of all others,—these circumstances being the assumed contamination of air, water or milk, with an undemonstrated specific poison, and the propagating of the disease thus induced, within certain limits, by contagion. As to such questions as why, general conditions of locality and population remaining alike, the diseases noticed broke out at the precise time they did; why, having broken out, they ceased to prevail at the time they did, no word of explanation appears; as to the operation of what, under the name of *epidemic constitution* was, in former years, acknowledged to be most important, although no more demonstrable than is the "specific poison" of the present theorists, not an allusion now occurs.

Taking the reports in their order, these are among the more important points touched upon: At Melton Mowbray, notwithstanding that neither of these assumptions obtains any support whatever from the circumstances stated, yet the outbreak of fever there is pointed out as due to infection, its subsequent diffusion by means of water and milk. So as regards sewer air, reasons are assigned for the suspicion that this cause was effective; but surely these are neutralised by the statement made that the occurrence of cases was not continuous along the sewers, but that they took place at intervals of place and time. As to the belief expressed that the disease in a neighbouring locality was due to infection, no evidence occurs that the supposed producing case was one of any form of fever whatever. So at Uckfield, drains, sewers, &c., had been improved many years ago; not until 1879 was fever particularly preva-

lent in the locality, nor could anything certain, according to the theories in question, be ascertained to account for the outbreak which began in that year, and continued in 1880. Contrary to what, for the most part, occurs in regard to *typhoid* fever, the greatest prevalence here recorded took place in the coldest period of the year; that is, during the more usual season of *typhus*. The probability of more than one well having been poisoned by specific infection is mentioned, but no grounds given for the assumption. At *Bridlington* a great and rapid increase of fever as compared to previous years, took place in 1880. With regard to a group of cases, the statement occurs that their origin could not be traced; that is, according to either of the theories mentioned. As to the spread of the disease, the argument used falls back upon the "possibility" that a supposed "specific infectious matter" may have got into a particular well, the water of which was made use of to cleanse milk vessels, and only so after having been boiled; also that, although sanitary defects existed in some of the houses infected, this was not the case with all. Here there certainly are certain facts stated in support of the belief that infection acted in the spread of the disease. At *Chorley*, together with the prevalence of "enteric" were scarlet fever, and "other doubtful kinds,"—the precise points of difference between those so named, and those designated "enteric" unstated; neither does explanation appear as to the nature of the general conditions likely to induce such differences in type. But the important concession occurs, that as regards the origin and propagation of the disease, inquiries failed to elicit satisfactory evidence. Just so. However objectionable to personal convenience, general health and well being, insanitary conditions, are,—and on this point there is no difference of opinion, yet when from evidence, such as is adduced in the reports in question, the conclusion is arrived at that such conditions, with or without the super-vention of "specific poison" by themselves, have been the originating cause of the epidemics described, it is not too much to assert that the conclusion is altogether unsupported by facts. With the exception of one instance already alluded to, it is difficult to believe that the prevailing fever, other than scarlatina, was spread by infection. Do not these particulars then indicate that if the true causes of epidemics are to be investigated aright, the attention of inquirers must take a larger scope of conditions and circumstances than such as are confined to drains, dairies, and sources of water supply.

FROM diseases of the zymotic class scarlet fever showed the largest proportional fatality in Hull, Nottingham, and Leicester; the deaths from this disease in Hull, which had been 15, 7, and 23 in the three preceding weeks, further rose to 29 last week, which considerably exceeded the number returned in this town in any week of the last ten years. Fever, principally enteric, showed the highest death-rate in Portsmouth and Hull. Diarrhoea showed a further general decline; being greatest in Leicester and Birmingham. Small-pox caused 37 more deaths in London and its outer ring of suburban districts, 2 in Liverpool, and one in Oldham; no fatal case was recorded in any of the other large towns.

Notes on Current Topics.

The New Scheme of Examination of the Irish College of Surgeons.

WE understand that the President and Council of the College have forwarded to the Home Secretary, the new scheme recently adopted by them and ratified by the College at large, and have asked his authority to the abrogation of the old bye-laws which are at variance with that scheme. On the other hand the section of the Metropolitan Fellows who have from the first, resisted this reform, and who were defeated in their effort to induce the College to negative it, have, we understand, addressed a letter to the Home Secretary asking him to withhold his ratification until the Royal Commission has reported generally on Medical Education. The purpose of this round robin is to cause such delay that it will not be possible to bring the scheme into operation for a year longer, but, as it is signed by 31 out of the whole of the constituency of Fellows, and does not contain the name of a single member of Council, save one, it is not likely to have much influence on the Government. Indeed, the motive of the movement is obvious from a perusal of the names attached to the document.

Sir William MacCormac.

IN our last we mentioned that a Knighthood was about to be bestowed on the Secretary-General of the International Medical Congress. This is now *un fait accompli*, and the universal feeling of the profession and of those who took part in the meeting is that the distinction has been well earned and is fully deserved. The incessant labour inseparable from the chief executive office of such an assembly must of itself have demanded sacrifices of time and money on the part of Mr. MacCormac which ought to be repaid by a lasting recognition of the success of his efforts.

The new Knight is an alumnus of the Queen's University in Ireland, where he took his M.D. degree in 1858, having been admitted a member of the Royal College of Surgeons in England in the preceding year. He was elected a fellow of the Royal College of Surgeons (Ireland) in 1864, and of that of England in 1874, and he is also a member of the Senate of the Queen's University (Ireland), a fellow of the Royal Medico-Chirurgical Society, a member of the Pathological, Clinical, and Medical Societies of London, and the Surgical Society of Ireland, and surgeon and lecturer in surgery at St. Thomas's Hospital; besides having been consulting surgeon to the Belfast General Hospital. He is the author of "Unity of Science," of "Notes and Recollections of an Ambulance Surgeon," being his experience during the Franco-German war, which work has been translated into German, with remarks by Stromeyer, and also into French and Italian; and of a "Treatise on the Antiseptic Treatment of Wounds," besides having contributed largely to the London and Dublin medical journals.

Sir William MacCormac is son of Dr. Henry MacCormac, of Belfast, whose attainments as a physician are well known to the readers of our journal to whose columns he has frequently contributed.

Medical Amenities in the United States.

THE illness of President Garfield has, it would seem, given rise to an interchange of professional courtesies which illustrate at once the competitive spirit in American medical practice and the utter lack of gentlemanly feeling in some members of the profession on the other side of the Atlantic.

It appears that Dr. Baxter, U.S.A., had been for years President Garfield's personal physician, but at the time of the accident was away from Washington, and did not get back until July 3rd, when the following conversation took place between him and Dr. Bliss, who had assumed charge of the case. The report of the conversation is made by Dr. Baxter, and published in Walsh's *Retrospect* :—

"Dr. Baxter—'Doctor, I have come to ask you to take me in to see the President.'

"Dr. Bliss—'Well, I don't see the necessity of your seeing the President; I wish to keep him quiet.'

"Dr. Baxter—'I make the request as the President's physician. I have for years been his physician.'

"Dr. Bliss—'Yes; I know your game; you wish to sneak up here and take this case out of my hands.'

"Dr. Baxter—'I wish nothing, Dr. Bliss except what I am entitled to. If the President prefers that you should take charge of his case, I haven't a word to say.'

"Dr. Bliss—'Well, you just try it on. I tell you that you can't do it. I know how you are sneaking around to prescribe for those who have influence and will lobby for you.'

"Dr. Baxter—'That is a lie!'

IN reference to this edifying conversation the *Philadelphia Medical Reporter* says that the unworthy and undignified position that the medical profession holds, compared with that it could rightfully claim, is largely attributable to such conduct as is above set forth. It is a matter for satire and a subject for comedy, how physicians quarrel over a patient. How unfortunate that this most public case gives occasion to repeat the sneers of Montaigne, Molière and Hogarth!

We can fancy how the profession in Great Britain would feel and what they would say, if one of Her Majesty's physicians were to accuse his colleague of "sneaking around to prescribe for those who have influence and will lobby for him," and we can sympathise with the sensations of disgust and anger with which respectable members of the profession in the States have read the coarse and utterly indefensible rowdiness of Dr. Bliss.

THE annual rates of mortality last week in the principal large towns of the United Kingdom were—Plymouth 14, Edinburgh 14, Wolverhampton 15, Sunderland 15, Portsmouth 15, Bristol 15, Bradford 16, Leeds 16, Norwich 16, Nottingham 17, Sheffield 17, London 18, Leicester 20, Salford 20, Oldham 20, Brighton 20, Glasgow 21, Dublin 21, Manchester 21, Birmingham 21, Newcastle-on-Tyne 23, Liverpool 24, and Hull 31 per 1,000 of the population.

MR. ALFRED WILKES, a retired copper-smith, of Birmingham, who committed suicide last month, has, it is stated, bequeathed his fortune, estimated at £100,000, in trust for the use of his two sisters during their lifetime, with reversion of the property, on their death, in equal shares of £50,000, to the Birmingham General Hospital and the Midland Institute.

French Opinions on the International Medical Congress.

THE representative of the *Union Medicale* at the International Medical Congress writes as follows:—"You may easily conceive that the life we are leading is very fatiguing to our legs, our heads, and our stomachs. English banquets are very well produced, but they lack three essentials—water, bread, and vegetables—or, at least, these are forthcoming in so small a quantity that they may be said to be absent; on the other hand, made sauces, clarets, champagne, sherry, and port, occupy the chief place in our repasts. Is it any wonder that gout has fixed its *habitat* amongst our English neighbours.

"I have spoken of the cookery of the Congress. I will not swear that some of the members have not made that department the principal object of their attention. Unhappily, the communications to the Congress have been, in consequence of the confusion of tongues, very imperfectly discussed. How is it possible to explain in French to a German, who does not understand our language, the purport of a communication in English which one has imperfectly comprehended?

"It is necessary not only to hear what is said, but to realise, speak, and fully understand the three languages."

The Coming Meeting of the Social Science Congress in Dublin.

ON the 3rd of October next the Twenty-fourth Session of the Congress will meet in Dublin on the twentieth anniversary of its first meeting in the same city in 1861. The Congress will be housed in the Museum Buildings of the University of Dublin, which have been placed at its disposal by the Board of Trinity College; and the arrangements for the reception of the Congress have been taken in hand chiefly by the Statistical Society of Dublin, of which Dr. Mapother is the President.

The following is a list of Presidents for the coming meeting of the Congress:—President of the Association—Lord O'Hagan, Lord Chancellor of Ireland; Jurisprudence—J. T. Ball, ex-Lord Chancellor of Ireland; Education—Sir Patrick Joseph Keenan, Resident Commissioner of National Education; Health—Charles Cameron, M.D., M.P. for Glasgow; Economy and Trade—Mr. Goldwin Smith; Art—Viscount Powerscourt. Dr. Mouat, late Inspector-General of Prisons in India, will be the Chairman of the Repression of Crime Section.

The Association was founded on the 27th July, 1857, at a meeting convened by, and presided over by, Lord Brougham, at which the proposed objects were explained by Mr. Hastings, M.P., now President of the Council, the founder of the Association. The fourth meeting of the Association was held in Dublin in 1861, the last three being held—for 1878, at Cheltenham, under the presidency of Lord Nortou; for 1879, at Manchester, with the Bishop of Manchester in the Chair; and for 1880, at Edinburgh, under the direction of Lord Reay.

The business of the Association is divided into five departments:—(1) Jurisprudence and Amendment of the Law; (2) Education; (3) Health; (4) Economy and Trade; and (5) Art.

I.—The *Jurisprudence* department is divided into three

sections with separate standing committees: (1) International Law; (2) Municipal Law; and (3) Repression of Crime.

II.—The *Education* department deals with the various questions relating to education—whether of the upper, middle, or lower classes of society.

III.—The *Health* department considers the various questions relating to public health, and the organisation and administration of the sanitary laws.

IV.—The *Economy and Trade* department takes into consideration the various questions relating to economic—social, political, and commercial.

V.—In the *Art* department, which has been added since the former meeting of the Association in Dublin, are considered all questions bearing upon art—considered in relation to civilisation, education, and industrial development of the people, and on the best methods of cultivating a sound and high standard of taste in all ranks of the nation.

It is however the Health Section in which we naturally feel the chief interest. Three days out of the five, over which the Congress will last, are to be entirely devoted to the discussion of the three special questions. These special questions which have been arranged jointly by the Central Committee in London, and the Dublin Department Committee are as follows:—

- (1) Is it desirable that Hospitals should be placed under State supervision?
- (2) Is it desirable that there should be a system of compulsory notification of infectious diseases; if so, what is the best method of carrying such a system into effect, and what is the best mode of enforcing the isolation of cases of infectious disease?
- (3) Is any further legislation desirable in order to more effectually prevent the overcrowding of dwelling-houses?

The first and fifth days will be occupied with the consideration of papers on subjects, other than the special, but still akin to the main object of the Section, and we believe several very practical papers are promised.

The second special question, viz., the compulsory notification of infectious disease, will be, in view of Mr. Gray's recent proposal in Parliament, the burning topic of the Section. Whether a supervision of hospitals by the State is the most likely way to conduce to their efficient management or not is a matter of very considerable importance, but at present it interests London Boards rather than us. Far different is the compulsory. Dr. Cameron, M.P. for the city of Glasgow has accepted the Presidency of this Section, which will give general satisfaction.

Dr. C. A. Cameron and Dr. Woodhouse, the Hon. Secs., invite all intending contributors of papers to send them in before the 16th inst., accompanied by a short abstract for the use of reporters for the press. }

Supposed Suicide of a Surgeon.

THE body of Surgeon-General Best, late of the British Army, of Great Western Terrace, Westbourne Park, has been found in the Thames, near Chiswick, by a waterman named Lewis. Deceased had been missing from his home since the 24th of August, and, it is said, appeared somewhat disturbed in his mind of late. The body, on which were found watch, chain, &c., and a small sum of money, has been identified by deceased's son-in-law.

Histological Anatomy of Hypertrophied Tonsils.

HYPERTROPHY of the tonsils is a common affection, and yet we scarcely know what are the lesions which constitute it. M. Cornil has recently been investigating the subject and communicated his results to the Société Médicale des Hôpitaux (*Le Progrès Médical*). He finds that tonsillar hypertrophy results:—1. From thickening, sclerosis of the intra-glandular connective tissue with thickening of the vascular walls. 2. From a special alteration of the closed follicles, consisting of a condensation of the reticular tissue and an increase in volume with granulo-fatty alteration of the leucocytes contained in the meshes of the reticulum. Hypertrophy of the tonsils is generally and with good reason, M. Cornil thinks, considered as a manifestation of scrofula. Now, if this is so, we cannot admit, by reference to the preceding lesions, the anatomical definition of scrofuloma given by M. Grancher. According to this author embryonic cellular tissue characterises or, at any rate, constitutes to some extent scrofulous productions. Now, tonsillar hypertrophy consists as we have just seen, of anything but simple granulation tissue.

Preliminary Examinations of the London College of Surgeons.

It is stated that the unprecedentedly large number of 650 candidates will be going through the Arts Examinations for the diplomas of Fellows and Members of the College, at Burlington House this week. As this examination is now abolished by the College, the diminution in the annual income of that institution will be considerable. Seeing there are two examinations held in the year, and the fee paid by each candidate is £2, the amount realised by the above number represents the sum of £1,300.

Treatment of Diphtheria by Pilocarpine.

DR. GUTTMANN, of Crustadt (Silesia), has been experimenting for eighteen months with pilocarpine in diphtheria. He has treated in this way 81 cases, almost all serious, and all have been cured. "After such success," says he, "it is impossible to doubt that the remedy is sure, and better than any of those hitherto employed." Many other physicians have tried it. Djensky obtained a cure in an apparently hopeless case where death was hourly expected. In almost all these cases the pilocarpine was employed alone. The cures took place in time varying from 24 hours to 3 days; in the most serious cases from 9 to 11 days. Guttman gives the pilocarpine internally, sometimes combining pepsine with it on account of its salutary action on the gastric catarrh; besides some of the false membrane is carried by swallowing into the digestive passages; on these it exerts a powerful solvent action. This is the formula he usually prescribes—Hydrochlorate of pilocarpine, 3 to 4 centigrammes; pepsine, 6 to 8 grammes; hydrochloric acid, 12 drops; distilled water, 80 grammes. A teaspoonful every hour.

THE Museum and Library of the Royal College of Surgeons is closed for the annual cleaning and re-arrangements, and will be opened on Monday, Oct. 3rd.

Dr. Scott.

THE case of Dr. Scott is one which we commend to the consideration of our readers. At the age of fifty-two, he is, by chronic rheumatism and valvular disease, quite unable to do any active work. He has a family consisting of a wife and five children—all girls—dependent solely upon him, besides an aged relative to whom for a long time he has been in the habit of giving relief. Dr. Scott graduated in Edinburgh, then married, and for four years practised in Stratford; subsequently he went to Lambeth, where he practised many years, and his dispensary having been in Vauxhall—quite one of the poorest parts of the parish—he had to a great extent to labour gratuitously, thus it was not possible for him to save much money. About ten years ago, and while at work in that locality, he was attacked with rheumatic fever, then with valvular disease. For a time he struggled on where he was, but becoming unfit for professional work he tried to maintain himself by starting a boarding house. In this he was unsuccessful, the locality being unfavourable to the speculation. It has been determined if possible to obtain for him the means of starting the family in a lodging house at Bournemouth. For this purpose, however, a sum of not less than £200 will be required. An endeavour is being made to raise this amount, and any donations to the fund will be thankfully received and duly acknowledged by Surgeon-General C. A. Gordon, C.B., 25 Westbourne Square, W.

To Mask the Taste of Cod-liver Oil.

A NEW method for the administration of cod-liver oil is suggested by Mr. Fairthorne, which consists in adding about one part of tomato or walnut catsup to four of the oil, the mixture being well shaken up before being taken. He remarks that taking an ordinary emulsion of cod-liver oil is like eating cod fish or lobster with a dressing of sugar and gum. He has found this mixture to agree much better with many persons than any other form which they have tried.

The Indian Medical Service.

THE Indian Government has drawn up a complete scheme of re-organisation of the Medical Department on the principle of unification of the British and Indian services. It is proposed that the latter should be permitted to die out, no new appointments being made, and that the medical officers appointed since 1865 should be amalgamated with the British establishment, which will supply Indian wants, and whence candidates for civil employment will be selected; the whole to be under Directors General for India. It is expected that some reduction in expenses will thus be attained. Brigade surgeons and surgeon-majors who entered the service before 1860 are to cease civil employment at the age of fifty-five.

THE fifty-fourth meeting of the German Naturalists and Physicians will be held this year at Salzburg, from September 17 to 24. It has been resolved to reduce the general addresses from three to two, in order to give more time for sectional work.

Sanitary Congress in Vienna.

A CONGRESS of Sanitarians is announced to be held in Vienna on September 14th, 15th, and 16th, under the auspices of the German Association of Public Health and the German Association for Technical Sanitation. Discussions will be invited on several set subjects of high importance in connection with hygiene and public health, and the task of bringing them forward has been entrusted to well-known special workers who will present reports on them. The following are the questions proposed for treatment: "The Hygienic Requirements in the Laying out and Use of Cemeteries," by Professor F. Hofman, of Leipzig, and Professor Roth, of Dresden; "The Use and Abuse of Alcohol," by Professor Binz, of Bonn, and Dr. Bär, of Berlin; "The Methods of Examination of Flour, with reference to the present condition of the Grinding Trade, and to Adulterations," by Professors Nowak and Vogl, of Vienna; "On Sewer Gases as Disseminators of Epidemic Diseases, and the Direction and Force of Air-currents in Sewers," by Dr. Soyka, of Munich, and Dr. Rozcahegyi, of Pesth; "A Demonstration of Apparatus to secure the Closure of Syphons and Water-closets against the entrance of Sewer-gas into Houses," by Dr. Renk, of Munich; "On the Advantages and Disadvantages of Warming by Heated Air," by Professor Fischer, of Hanover, Professor Fodor, of Pesth, and Dr. M. Gruber, of Vienna. The importance attaching to an exhaustive and authoritative examination of these several subjects can hardly be over estimated, and we may reasonably look for much valuable result from this conference.

Unqualified Assistants.

THE employment of unqualified assistants in responsible posts by medical men, is a proceeding that has again and again drawn from us and from the other professional organs emphatic protests against a practice fraught with such danger as it must necessarily be. And still the same thing continues to an extent that would hardly be credited; and this, too, in spite of the many warnings recently uttered by magistrates and coroners who have had before them examples of the danger incurred by a persistence in the evil. Only in the past week Mr. Collier, the Deputy Coroner for East Middlesex, found himself compelled to advise a practitioner in the East End to employ for the future none but qualified assistants, being induced to pursue this course by the nature of the evidence relating to the death of a woman who had been for a time attended by a medical student. The fact of qualification, it is sometimes urged, confers nothing more than a proof of having passed an examination, adding nothing to the capacity of the successful examinee. This, however, should not be accepted by any one as an argument in favour of employing unqualified persons, of whatever experience they may be possessed, for it is no more than is rightfully to be expected of every aspirant to the privileges and gains attaching to medical practice, that he shall prove himself fitted to enjoy them after the only fashion recognised both by the public and by the law. It may very well be that a medical student of four years' standing is as well qualified to have charge of a case as the majority of general practitioners, but until he has proved this in the only satisfactory way, neither he can con-

scientiously engage in, or be conscientiously engaged by another, to undertake the practice of medicine. The other questions that crop up in connection with unqualified assistants are many and important, and we shall, at as early a date as can be arranged, review the whole subject, and illustrate it by means of special reports which are even now being prepared by a commission issued for that purpose.

The Health of Rome.

THE occurrence of typhoid fever among the foreign visitors to Rome has served to excite the endeavours of the *Italian Times* to abate the evils consequent on imperfect sanitary arrangements in the Roman hotels, and in pursuance of these efforts a commission was appointed some time ago to inquire into and suggest improvements on the then existing arrangements. In a criticism of Prof. Toscani's communication to the late Congress on "The Health of the Roman Hotels," the *Italian Times* elaborately and completely justifies the lines on which the commission appointed by it pursued its labours, conclusively demonstrating an undue prevalence of typhoid fever among English visitors to Rome last winter, and referring with well-merited satisfaction to the improvements brought about by its endeavours in the sanitary condition of the hotels. It must be admitted that the *Italian Times* has been instrumental in bringing about much-needed changes that will be productive of good results alike to the Romans and those who visit Rome, and we are glad to know how much success has attended its efforts.

Drinks for the Temperate.

THE total abstinence crusaders are not without some support in favour of their peculiar principles, but it is, after all, a false prop on which they chiefly depend for safety. That the moderate drinker must necessarily become a drunkard is by no means a demonstrated fact; but that the ordinary thirst of mortals needs some more stimulating fluid to satiate it than the filtered ditch-water supplied by London monopolists of the water-company order is sufficiently patent. The attempt made by numerous inventors to meet the wants of the times in this direction are not all of them deserving of condemnation, though a few undoubtedly are, on the ground of deleterious composition; but, one and all, they are far too costly to ever meet the requirements of the vast majority of moderate drinkers, who, for want of a better substitute, are driven to imbibe the poisonous mixtures that stand for bitter beer and stout in the taverns of this country. That which would best of all be suited to replace these miserable drinks is the thin, light, refreshing beverage known as lager beer, or Bavarian. This, however, though costing little in the region whence it derives its name, cannot be bought in England for a sum so small as will purchase the omnipresent "bitter," and in its absence it should be possible for home brewers to produce either it or a substitute like to it, and harmless. We commend the problem to the brewing interest, and feel assured they will be wise to profit by our advice.

It is currently reported that Mr. Francis Wise, of Cork, is about to bestow £27,000 for charitable purposes; and of that sum £3,000 will go to the Cork South Infirmary, and £2,000 each to the North Infirmary and the Fever Hospital.

ANNUAL collections were made throughout London on Saturday last by means of collecting sheets in workshops and by boxes in the streets on behalf of the Hospital Saturday Fund.

In the melancholy loss of life occasioned by the foundering of the royal mail steamer, *Teuton*, off the Cape last week, the name of Mr. Rose-Innes, M.B., of Norfolk Street, Strand, appeared, and another surgeon, whose name is not mentioned.

DIARRHŒA, which has been steadily declining during the last four preceding weeks, has fallen, under the influence of unseasonably low temperature, to 117, being no less than 140 below the corrected average in the corresponding weeks of the last ten years; 85 were infants under one year of age, and 21 of children between one and five years. The deaths of 2 children aged between one and five years, and of a person aged 15 years, were referred to simple cholera or choleraic diarrhœa.

In the principal foreign cities the rates of mortality, according to the latest official weekly return, were in—Calcutta 21, Bombay 36, Madras 33; Paris 26; Brussels 24; Amsterdam 23, Rotterdam 20, The Hague 24; Copenhagen 20, Stockholm 18, Christiana 15; St. Petersburg 51; Berlin 38, Hamburg 29, Dresden 35, Breslau 40, Munich 38; Vienna 26; Prague 28; Buda-Pesth 40; Turin 34; Alexandria 41; New York 36, Brooklyn 35, Philadelphia, 23, and Baltimore 29 per 1,000 of the various populations.

THE First Matriculation Examination at the Royal University of Ireland will be held on December 6th, for which students must send in their papers before October 15th. A meeting of the Senate was held last week to make all the necessary arrangements required. The reduction of the grant by Parliament for its maintenance, from £40,000 to £20,000, will necessitate a [general curtailment of expenditure, including a clipping of the monstrous prize-bribes held out as a bait for students.

THE sum of £6,000 has been bequeathed to the Paisley Infirmary by the late Mr. James Clark, thread manufacturer. Of that amount £5,000 is to be devoted to the relief of consumptive patients at their own homes, while the remaining £1,000 is for the endowed funds of the Institution. The Fishmongers' Company have voted £210 in aid of the maintenance and extension of the Brompton Consumption Hospital. Mr. T. J. Howell, formerly of Stroud, but who died at Clifton, Bristol, has bequeathed the sum of £2,000, free of duty, to the Stroud General Hospital.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

THE COLLEGE OF PHYSICIANS, EDINBURGH.—Royal Commissions are apparently not without their use, for we hear that the above-mentioned College is carefully considering the advisability of doing away with its separate licence. This intention, if duly carried out, will entail a considerable sacrifice on the part of the College, and greatly diminish its funds, for a good business is done among a class of persons who, having scraped through a surgical examination, suddenly find themselves in want of a medical qualification. The Edinburgh "distinction" is a little more showy than that of the London Apothecaries, and the examinations are about equal, especially if a candidate spends a week in Edinburgh and gets a tip or two. The College of Physicians has always shown itself more ready to move on with the times than its brother, the College of Surgeons, and as a proof of this we may note the institution of an examination for its membership which is virtually for its fellowship. Nothing short of an earthquake will disturb the profound coma into which the College of Surgeons has fallen.

REGISTRAR-GENERAL'S RETURNS FOR SCOTLAND.—The death-rate in the eight principal towns during the week ending with Saturday, the 27th August, 1881, was 17·4 per 1,000 of estimated population. This rate is 1·0 below that of the corresponding week of last year, and 0·4 below that of the previous week of the present year. The lowest mortality was recorded in Leith—viz., 8·4 per thousand; and the highest in Paisley—viz., 26·1 per thousand. The mortality from the seven most familiar zymotic diseases was at the rate of 3·2 per thousand, or 0·5 below the rate for last week. Acute diseases of the chest caused 52 deaths, or 24 less than the number recorded last week. The mean temperature was 52·4, being 1·9 below that of the week immediately preceding, and 6·8 below that of the corresponding week of 1880.

METEOROLOGICAL STATIONS IN SCOTLAND.—Owing to the indefatigable exertions of a private individual, Mr. Clement J. Wragge, meteorological stations have been founded at Fort William, and on the top of Ben Nevis. An account of the observations are telegraphed daily to the Meteorological Office in London, where Mr. Wragge's reports are gratefully accepted, but for which no substantial return is made. In America they do these things differently. Since Mr. Gladstone's return for Midlothian, the Government is becoming more Scotch than ever, and the maxim never to pay for what you can get for nothing, so dear to the minds of the dwellers north of the Tweed, is being carried out to the letter. The practical value of these observations, to a great commercial nation, is beyond question; hence the establishment of meteorological stations throughout the kingdom should at once be considered by a Liberal Government. The dread which some persons have, to what is called the endowment of science, is scarcely applicable here, for a knowledge of meteorology is becoming daily more imperative. The time may come when our harvests will be entirely independent of the weather, for only those things will be planted which are adapted to the meteorological conditions of the locality.

THE DUKE OF CAMBRIDGE AND THE EDINBURGH INFIRMARY.—Colonel Hale has written to the managers of the Royal Infirmary expressing the satisfaction which the Duke experienced on his recent visit to the institution, and enclosing a remittance of £20 towards the funds for its main-

tenance, stating that it affords His Royal Highness pleasure to make this contribution.

Literature.

ZIEMSSSEN'S CYCLOPÆDIA OF PRACTICAL MEDICINE. (a)

THIS now well-known work is approaching its completion, and the verdict about it will be that it is very unequal, as this volume undoubtedly is. It commences with an anatomico-physiological introduction by Professor Ponfick, of Rostock, of which the less said the better. The modesty of other, and fitter men, no doubt interfered with their undertaking the task; and all that can be said is that Professor Ponfick knew too little of the subject to comprehend its importance. One naturally looked for an exhaustive analysis of the subject in a work of this ambitious character, telling us something on the clinically interesting question of how far disease of a portion of the liver interferes with the functional activity of the parts free from disease, and cognate matters, to which we find no allusion even. The function of the liver occupies two pages, of which the production of bile and bilirubin occupies fully one. Jaundice he divides into Hepatogenous Cholemia, and Hematogenous Cholemia.

The next subject is by Professor Thierfelder and includes "Hyperæmia of the Liver," and the even more interesting subject "Cirrhosis or Interstitial Inflammation of the Liver," in which the reader will find a great deal that will interest him; and instruct him too, or we are mistaken. The different causal relations of cirrhosis are given in detail, and its association with alcohol clearly pointed out, as also its relations to the gouty dyscrasia and to malaria. "Acute Atrophy" and "Simple Atrophy" follow. Of this portion of the work we can speak with unqualified praise. The next chapter is on the "Pathological Anatomy of Cancer of the Liver," by Professor Schueppel. It commences with Primary Cancer which he holds to be of relatively rare occurrence, compared to Secondary Cancer. It may occur as a simple cancer, or as multiple nodes. The new formation readily breaks into the veins. The peritoneal covering of the liver hinders the development of cancer in it. Ordinarily, cancer of the liver is secondary to cancer of the pyloric ring, or of the intestines; the growth of such secondary cancer being much more rapid than that of the primitive carcinoma. Amyloid degeneration he regards as but part of a general widespread pathological process.

In the chapter on "Fatty Liver," he first discusses the possibility of the liver being a natural depository of fat. In the cod-fish it undoubtedly is; and in hibernating animals the same is the case. Young animals, while suckling, have a large quantity of fat in their livers; but in adult animals fattened for the butcher the liver is not fatty, though Majendie found the liver to become fatty in dogs fed exclusively on butter. As a disease, fatty degeneration of the liver is often found in wasting diseases, especially pulmonary phthisis. At other times it is found in advanced drunkards, or in phosphorus poisoning. The liver is also at times the seat of pigment changes.

"The Parasites of the Liver" are described by Prof. Heller in a very brief chapter.

The Diseases of the Biliary Passages are again the work of Von Schueppel, and are handled at some length. The enlargement of the gall-bladder from accumulation of its contents is well differentiated from maladies for which it might be mistaken. In treating of gall-stones he thinks the facets not so much due to attrition as to their original development according to conditions within the gall-bladder. This is a good chapter, even to the treatment.

Then follows "Diseases of the Portal Vein." It seems "the portal vein bore an extremely bad reputation among the older physicians." Many diseases once ascribed to it—as ascites—are now proved to really belong to anatomical changes elsewhere. This subject is also well handled.

The diseases of the liver are matters of growing interest, and the advance of physiology makes them still more interesting; consequently, these chapters will be attentively

(a) Vol. IX. Disease of the Liver and Portal Veins, with a Chapter on Interstitial Pneumonia. London: Sampson Low, and Co. 1880. Pp. 928.

read by many. They lack, however, a chapter which makes the late Dr. Murchison's book of such priceless value to the practical physician—viz., that on "The Functional Disorders of the Liver," which are its most important maladies in ordinary practice.

The last chapter in the book is one by Prof. Jurgensen on "Interstitial Pneumonia, Cirrhosis, and Bronchiectasis." Interstitial pneumonia is never a primary disease he holds. Consequently, it is seen with such a variety of associations, that this prevents it being described with clearness. In this he seems right. The historical sketch is interesting. As to its relations with catarrh he is doubtful. "Dust-lunge" are described at some length. Then its relations to bronchial dilatation are given. The diagnosis is well arrayed; and, indeed, the whole chapter is one well worthy of careful perusal by every practitioner.

Taking Ziemssen's Cyclopædia altogether, we can say it is a useful work for a practitioner who already knows what he is about. To the habitually non-reading man, of course, it is valueless, as he would never read it. This, of course, is no fault of the book's. As to the book, whether or not it has realised the high hopes entertained by the publishers and translators as a commercial success, we know nothing; as reviewers, we question if the early anticipations have been quite realised.

LIVEING ON SKIN DISEASES. (a)

THE value of a compact, reliable, and exact volume, descriptive of the signs and treatment of skin affections, cannot be too highly estimated, since so large a number of the cases occurring in ordinary practice are of this nature. Dr. Liveing's little work combines the features essential to constitute a useful guide to dermatology; and the second edition of the book contains such improvements as bring it abreast of modern changes in the department of medical science which it treats. Students and practitioners alike can have no better assistance than it will render in the treatment of every form of skin disease.

CONTRIBUTIONS TO MILITARY AND STATE MEDICINE. (b)

THIS purports to be the first of what, it is hoped, may become a long series of volumes; and no doubt the author will learn as he proceeds to arrange and condense his subjects, and manner of treating them. A large portion of the present volume is devoted to a consideration of the influence of drinking water in originating or propagating enteric fever, diarrhoea, dysentery, and cholera. With regard to these several points, his remarks embrace a wide field. He refers to, and quotes freely from, authors and observers whom he names, the result being that the conclusions he arrives at are by no means in accord with those expressed by that class of writers who find in the theory of "specific poisons" a convenient and ready explanation of what they call *pathogenic* diseases. The author states his opinion strongly (pp. 86, 138, and 207) that "the specificity of a disease does not necessarily imply specificity of its cause." Following up the argument of a high authority whom he quotes (p. 96), he expresses his own belief that "if the ordinary feverish state be prolonged for a considerable time, and be severe in degree, it is likely that the bioplasm in the blood may give origin to bioplasm with marvellously increased powers of retaining its vitality, of growing and multiplying." With reference to what in India has of late years been called "enteric" fever, he observes (p. 228) that throughout reports on that form of disease "an anxious effort is everywhere observable to bring home a definite source to the contagium of enteric fever." He alludes (p. 230) to outbreaks so designated which in 1872 occurred at many military stations throughout India. With reference to these, he quotes from the report on the epidemic by the late statistical officer for Bengal, thus:—"To me it appears an admirable demonstration of the truth that the typhoid of India is not primarily attributable

(a) "A Handbook on Diseases of the Skin." By Robert Liveing, A.M., M.D. Cantab., F.R.C.S. Lond., etc. Second edition. Longmans, 1880.

(b) "Contributions to Military and State Medicine." First volume. By John Martin, Surgeon, Army Medical Department. London: J. and A. Churchill. 1881.

—to special and locally existing conditions. It was not enteric fever alone which came forward—but purely climatic fevers of every variety;” also, the views by the highest military medical authority in India that, as a consensus of causes the chief “seems to be the prolonged exposure of an alien and unripe constitution to an intensified and unaccustomed temperature, to which certain other recondite climatic conditions may probably be superadded.” And so on. This volume will probably do more than any other yet published to call back, as it were, opinion in India from the pursuit in which it has been too long engaged of what, up to the present time, is but an abstraction.

Obituary.

DR. BILLING, F.R.C.P. Lond., F.R.S.

Few obituary notices are written, without the use of the word regret, but it would be incongruous both to the nature of the subject of this brief memoir, to his brilliant life, and peaceful death, at the patriarchal age of ninety-one, to bring it into juxtaposition with either. There were few men in the profession of more original powers, and, at the same time, of a more highly cultured intellect than Dr. Archibald Billing, “the father of the profession,” as he has been not unfrequently styled, whose death took place on Friday last. It is not often that the two qualities are found in union. Nature and art are not frequently so joined together. The vigorous spring of mind, associated with fertility of thought and novelty of conception, is often impatient of the slow training and austere self-subjection which wear down the inequalities of genius, and give it a grace and polish that enhance its native power.

An Irishman by birth, he had much of the *vis animi* that distinguishes his countrymen. He studied first at Trinity College, Dublin, and afterwards at Oxford, where he took his degree. Without being a very frequent contributor to medical literature, he achieved a high reputation by the solidity of his essays. His work on the “First Principles of Medicine,” and that on the “Sounds of the Heart,” are written in a style of extreme elegance, aiming however at terseness and antithesis, and smelling somewhat of the midnight oil of honest labour. In the preface to his book on the “Principles of Medicine,” we find these characteristics most apparent.

With a true independence of mind, Dr. Billing did not reduce his “Principles of Medicine” to a system, but contented himself with merely laying down those principles that were deduced by his own reflections, and the book is consequently original in every page. Dr. Billing’s views on the “Sounds of the Heart” are probably not well known to the present generation. He considered that the sounds are produced by the tension of the valves, and by this cause alone. Of him it may be said that he was the first to deliver clinical lectures in the metropolis. He instituted these lectures in the London Hospital, in 1822, in which year he was appointed physician to the Hospital, and continued them until 1836, when he was nominated a member of the Senate and examiner in medicine in the University of London. As a lecturer he was fluent, logical, and entertaining, and, to use a common expression, was “literally worshiped” by his students, of whom Dr. W. J. Little and a few others survive him.

It also deserves to be mentioned that the use of auscultation was first adopted in this country by the staff of the London Hospital, led by Dr. Billing. He was a lover of the fine arts, and a few years ago was well known in the metropolitan circles for his musical taste and associations, and as being the favourite consultant with the operatic stars of the period. His sympathies were with the beautiful, and his classical work “On Gems and Coins” stamped him as a man of refined culture, of linguistic attainments, and research, to which few in the busy profession of medicine can hope to attain.

Both professionally and in private life, Dr. Billing was a great favourite, his candour, his amiability, and reticence to push himself or his views to the fore, won for him universal esteem, and when the news of his death reaches those who had the pleasure of personal acquaintance, naught but an affectionate ejaculation will escape their lips to his memory. During the last few years he has lived in quiet retirement at his house in Park Lane, London, and as evidence of vigour, both of body and mind, it may be mentioned, that up to the age of 84 he might have been seen taking horse exercise, and

at the age of 90, playing a game of billiards, or backgammon, with members of his family, or a privileged friend. His intellect, beyond a little haziness of memory, was clear to the last, and when the end of the revered old patriarch came to him in his sleep on Friday last, no member of the profession was present; and Dr. Murray, who arrived half an hour after, certified that a long life had gently ebbed away. As evidence of longevity of brain workers, Dr. Billings’ affords a useful case, and when we add that his wife who survives him, is six months older, the coincidence is not a little remarkable. We understand that the funeral will take place at Kensal Green Cemetery on Friday next at 12 o’clock, so that those who desire to pay a last tribute of respect to the deceased, will have an opportunity of so doing.

Correspondence.

THE TEMPERANCE BREAKFAST AT THE ISLE OF WIGHT.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I agree with what you say in your editorial remarks of August 24, upon the repast so hospitably offered by the members of the National Temperance Association to the members of the British Medical Association. That should, as you say, be an annual opportunity for discussing the principles which ought to guide members of the medical profession in their use of alcohol in their own households, and, perhaps, even in the treatment of disease.

If allowed to say a few words in your paper, I would, first of all, observe that there is a great change noticeable in the way in which the discussion on alcohol is now carried on. I have, all my life, disliked all kinds of alcoholic fluids, because they have so thoroughly disagreed with my own health; and, as is not unfrequently the case, I have been perhaps led to see too frequently the evil effects of wine, spirits, and beer in others, on that personal account.

However this may be, it is certain that my long experience in hospitals, both in London, and also in Paris, has made me look upon the habitual use of alcohol as one of the very most frequent causes of chronic disease and death.

Thus, next to pulmonary consumption, I am pretty sure that diseases caused by beer, spirits, &c., cause, among hospital patients here in London, the greatest number of fatal ailments. Moderate drinking, I therefore look upon as a most dangerous experiment, and decidedly think that no theory of diet can be hygienic which admits into it a daily dose of some form of alcoholic fluid. My impression is that I have seen hosts of men, and not a few even in our own profession, begin with moderation, and go on to the miserable *finale* of the tippler, who might have lived until 85 or 90, had we had that more thorough discussion, which you will suggest. I candidly confess that I think science and virtue (by *virtue*, I mean that conduct which conduces to human happiness), are on the side of the total abstainers.

I am, Sir,

Yours, &c.,

C. R. DRYSDALE, M.D.

17 Woburn Place, London, W.C.

August 25, 1881.

OPHTHALMIC TEACHING IN IRELAND.

At a recent meeting of the Council of the Royal College of Surgeons in Ireland, the following resolution was passed, viz. :—

“That no certificate in clinical ophthalmology be recognised in future by this College, unless it be granted by an institution which permanently devotes eight beds in a special ward or wards to patients suffering from diseases of the eye, for the instruction of students, and which has an extern department for eye cases, distinct from any other dispensary, open for the teaching of students at least twice a week. Instruction in the use of the ophthalmoscope to be essential.”

This resolution does not apply to students whose instruction in clinical ophthalmology is antecedent to this date.

University of London.—The following candidates have passed the recent 1st M.B. Honours Examination:—

ANATOMY.

First Class.

Prideaux, Frances Helen (Exhibition and Gold Medal), London School of Medicine for Women.
Wenyon, Edwin James, B.A., B.Sc. (Gold Medal), Guy's Hospital.

Second Class.

Targett, James Henry, Guy's Hospital.
Martin, Albert, Guy's Hospital.

Third Class.

Merrifield, Sydney Sargent, King's College.

PHYSIOLOGY AND HISTOLOGY.

First Class.

Thorburn, William, B.Sc. (Exhibition and Gold Medal), Owens College.
{ Hind, Wheelton, Guy's Hospital.
{ Turner, Alfred Jeffaria, University College.
{ Reynolds, Ernest Septimus, Owens College.
{ Thomson, Theodore, Univ. Aberdeen and University College.

Second Class.

Knight, Frederick, University College.

Third Class.

{ Horrocks, William Henry, University College.
{ Targett, James Henry, Guy's Hospital.
{ Shore, Thomas William, B.Sc., St. Bartholomew's Hospital.
Wenyon, Edwin James, Guy's Hospital.
Cave, Edward John, St. Bartholomew's Hospital.

MATERIA MEDICA AND PHARMACEUTICAL CHEMISTRY.

First Class.

Vann, Alfred Mason (Exhibition and Gold Medal), King's College.
Merrifield, Sydney Sargent, King's College.
Scharlieb, Mary Ann Deacombe, Madras Medical College and London School of Medicine.

Second Class.

{ Gostling, William Ayton, University College.
{ Shore, Thomas William, St. Bartholomew's Hospital.

Third Class.

Bailey, Charles Frederick, St. Bartholomew's Hospital.
{ Knight, Frederick, University College.
{ Short, Thomas Sydney, King's College.
Cave, Edward John, St. Bartholomew's Hospital.

ORGANIC CHEMISTRY.

First Class.

Hind, Wheelton (Exhibition and Gold Medal), Guy's Hospital.
*Thorburn, William, Owens College.

Second Class.

Targett, James Henry, Guy's Hospital.
{ Meyer, Charles Hartvig Lomo, Guy's Hospital.
{ Tomlinson, Emily, London School of Medicine for Women.
* Obtained the number of marks qualifying for a Medal.

Indian Medical Service.—The following gentlemen were successful at the competitive Examination held at Burlington House on Aug. 15th and following days:—

Marks		Marks	
Young, L. T.	.. 2702	Smyth, John	.. 2175
Gibbons, J. B.	.. 2610	Ree, R. B.	.. 2125
Grant, D. St. J.	.. 2410	Greany, H.	.. 2015
Shand, G. J.	.. 2300	Kernan, J.	.. 1965
Crawford, D. J.	.. 2285	Youngerman, E. P.	.. 1795

Twenty-nine candidates competed for ten appointments; twenty-seven were reported qualified.

NOTICES TO CORRESPONDENTS.

DR. HUBBARD (New York) is thanked for his courteous note.

MR. RYNDOLDS.—Sorry we have not space for the address, we will refer to it in another column.

MR. A. S. T.—You will find the subject fully discussed in our issue for July 27th.

A DURHAM QUACK.—Your ebullition is beneath contempt. So long as persons of your stamp follow such base practices, we shall continue to expose you, notwithstanding your threats and filthy vituperation.

DR. H. A. H.—Thanks, in ample time; late news, if short, we can accept up till first post on Tuesday mornings.

MR. J. JARVIS WILLS.—Certainly, with pleasure.

THE GOVERNMENTAL VALUE OF PATENT MEDICINES.—According to the figures recently presented to Parliament the stamp duty on patent medicines in the year ending the 31st of March last amounted to £189,702 15s. 10d.

POISONED FLOUR.—It is stated that inferior flour is frequently made to pass in the market as of best quality by the use of quantities of arsenic. How such a thing can happen it is difficult to understand. But it did happen the other day at Inverness, with disastrous results. A family were made ill through eating a pie thus poisoned, and the cook died. Nor is this the first or second case of the kind which we have read of in the country papers lately.

AN F.R.C.P.—We believe there is still living one older Fellow of the College than the venerable Dr. Billing. The latter would shortly have attained his 91st birthday, his mental faculties being clear to the last.

THE FULHAM SMALL-POX HOSPITAL CASE.—This case came again before Justices Cave and Kay on Monday last. Efforts had been made to bring about an arrangement between the parties, but unsuccessfully. Their Lordships granted an injunction restraining the authorities from bringing to the hospital any patient beyond the radius of one mile.

LONGEVITY IN THE PROFESSION.—Under the head of "Deaths" in the present number, will be found the names of two members of the profession who had reached the patriarchal age of 90—Dr. Billing, and Mr. Clewin Griffith. Both had led active lives, and both were resident in the largest city in the world.

ANOTHER MEDICAL KNIGHT.—As we are going to press we learn that Her Majesty the Queen has conferred the honour of Knighthood on George C. M. Birdwood, M.D., C.S.I., of the Indian Museum. Dr. Birdwood is the second son of General Christopher Birdwood, of the Bombay Army, and was born 1832. After serving for many years on the Bombay Medical Staff, he was appointed Special Assistant in the Revenue, Statistics, and Commercial Department of the India Office, where he has had special charge of the Indian Museum, and he has examined and reported upon the stores of Indian curiosities and works of art contained therein. He has also written a handbook on Indian industries, and has commented largely upon Indian literature and philology.

Vacancies.

Bath General Hospital.—Resident Medical Officer. Salary, £100, with board. Applications (under cover to the Committee) to be addressed to the Registrar before Sept. 22.

Birmingham Children's Hospital.—Assistant Resident Medical Officer. Salary, £40, with board, &c. Applications to the Hon. Sec. before Sept. 20.

Liverpool Northern Hospital.—Assistant House Surgeon. Salary, £70, with residence. Applications to the Chairman of the Committee not later than September 12.

Newton Abbot Union.—Medical Officer. Salary, £85, with the usual extra fees. Applications to the Clerk's Office before Sept. 13.

Northumberland Lunatic Asylum.—Assistant Medical Officer. Salary, £100, with board. Applications to Dr. McDowell, at the Asylum, Morpeth.

Appointments.

AGLAND, T. D., M.B. Oxon, M.R.C.S., L.R.C.P., House Surgeon to St. Thomas's Hospital.

BARTON, —, M.D. Dub., L.R.C.S.I., Surgeon to the County Donegal Infirmary.

BUTLER, H. P., M.R.C.S., L.R.C.P., Resident Accoucher to St. Thomas's Hospital.

CARPENTER, A. B., B.A. Oxon, M.R.C.S., L.R.C.P., Assistant House Physician to St. Thomas's Hospital.

COXWELL, C. F., B.A., M.B. Cantab., M.R.C.S., House Physician to St. Thomas's Hospital.

EDWARDS, J., L.R.C.P. Ed., M.R.C.S., Surgeon to Her Majesty's Prison at Leeds.

HOLMSTON, H. N., M.R.C.S., L.R.C.P., Assistant House Physician to St. Thomas's Hospital.

WELLS, A. E., M.R.C.S., Assistant House Surgeon to St. Thomas's Hospital.

Births.

CLOUTING.—Aug. 30, at Theford, Norfolk, the wife of J. B. Clouting, M.R.C.S.E., of a son.

GOULD.—Aug. 29, at 16 Queen Anne Street, W., the wife of Alfred F. Gould, M.S., of a son.

HODSON.—July 31, at Taraghur Sanitarium, near Ajmere, Rajputana, India, the wife of Robert D. Hodson, Surgeon, A.M.D., of a son.

ILIFFE.—Aug. 27, the wife of Walter Iliffe, of a son.

PLAYFAIR.—Aug. 28, at Rutland Street, Edinburgh, the wife of John Playfair, M.B., F.R.C.P.E., of a daughter.

WAKLEY.—Aug. 30, at Heathlands, Long Cross, Surrey, the wife of James G. Wakley, M.D., of a daughter.

Marriages.

BAIRD—HURFORD.—Aug. 29, Jas. A. Baird, L.R.C.S.I., of Dublin, to Dorah Georgina, youngest and only surviving daughter of James T. Hurford, Esq., Valuation of Ireland Department.

CASH—BRIGHT.—Aug. 24, at Torquay, John Theodore Cash, M.D., of London, to Margaret Sophia, youngest daughter of the Right Honourable John Bright, of Rochdale.

OWENS—HOOLY.—Sept. 1, at Tharston Church, Long Stratton, Norfolk, Charles A. Owens, M.D., of Long Stratton, to Marion, only daughter of the Rev. S. C. Hooly, Vicar of Tharston.

Deaths.

BAILLIE.—Aug. 27, at Dover, George Olaus Baillie, late Surgeon-Major 6th Bengal Cavalry, eldest surviving son of the late George Baillie, H.E.I.C.S., aged 51.

BILLING.—Sept. 2, at 34 Park Lane, London, W., Archibald Billing, M.D. Oxon, F.R.C.P. Lond., F.R.S., in his 91st year.

BRADLEY.—Aug. 22, at Castle Green, Sandgate, William Henry Bradley, Retired Deputy Inspector of Hospitals, late of H.M. Indian Forces.

COWAN.—Aug. 24, at Queen's Hotel, Upper Norwood, Dr. James Moffatt Cowan, of the late H.E.I.C. Service, of Edinburgh.

GRIFFITH.—Sept. 5, at 90 Gower Street, London, E. Clewin Griffith, M.R.C.S., aged 90.

ROSE-INNES.—Aug. 31, drowned by the foundering of the Royal Mail Steamship Truston, at the Cape, J. Rose-Innes, M.R., G.M., of Arfour, Banff, and London, aged 26.

TELFORD.—Aug. 25, at the residence of his brother, 38 Longfield Place, Bury, Lancashire, John Campbell Telford, L.F.F. & S.G., L.R.C.P., L.M., of Whitefield, aged 28.

SOME OF THE CRANIAL CHARACTERISTICS OF IDIOCY. (a)

By G. E. SHUTTLEWORTH B.A., M.D., &c.
Medical Superintendent Royal Albert Asylum for Idiots and Imbeciles of the Northern Counties, Lancaster.

VISITORS to idiot asylums not uncommonly remark absence of striking abnormalities in size and form of heads of patients. This remark is true so far as a general view of the majority is concerned, but closer examination shows that, whilst the average measurement of all the heads does not differ greatly from that of the heads of a like number of normal children, (b) there exists at each end of the series remarkable deviations. The microcephalic cases on the one hand, and the hydrocephalic and hypertrophic on the other, furnish the most remarkable deviations from the average size; (c) and attentive investigation shows that, as regards form, there are certain definite peculiarities of the crania, which, indeed are pretty constantly associated with certain definite varieties of mental defect. Thus in *microcephaly*, whilst deficient size (c) is the most striking feature, a forehead tapering to the vertex, an imperfectly developed occiput, and a more or less bird-like physiognomy are frequently associated with quick observation, expressive gesture, but deficient speech. In such cases, formative arrest of the brain may be often traced, (c) and this would seem to be the primary cause of microcephaly rather than premature synostosis. In cases of the so-called "*Mengol*" or "*Kalmuc*" idiocy, again definite cranial characteristics co-exist with definite mental peculiarities. A parallelism of the planes of the face and of the back of the head, a brachycephalic condition, with tendency to equality of longitudinal and

transverse cranial measures, an obliquity of superciliary margins of the orbit, and a flattening of the bridge of nose are in this class of cases associated with a peculiar condition of the skin and mucous membrane. Mentally, idiots of this type are very imitative, have a correct ear for time and tune, and are fairly educable. They almost invariably die of phthisis. (a)

In *Cretinoid idiots* the large irregularly expanded head, the distant orbits, and the depressed root of nose, co-exist with general heaviness, dulness of eyes, and wide and coarse nose and mouth, and a corresponding stupidity and slowness of comprehension; and, speaking generally, similar characteristics exist in the class described by Hilton, Fagge, and others, as "sporadic cretins." A horizontal position of the basilar process, observed in the former class by Fodéré, Ackerman, and Niépce, does not seem to obtain in the latter class. Sporadic cretins are usually dwarfs, and their mental stature is also of a diminutive kind. They are slow and deliberate in all their actions, and in some cases, able to express themselves, moderately by speech. The resemblance they have to each other in outward appearance is very remarkable.

The cranial characteristics of *hydrocephaly* consist of a general obovale appearance of the crown looked at from above, the greatest circumference being found at the temples, where there is often a perceptible bulging, and the back of the head being flattened. When active disease has subsided, much improvement is effected in this class by training. In the rarer *hypertrophic* class, the size of the head is also increased, but the bulging is just above the superciliary ridges (not at the temples) giving the forehead a square appearance.

In some cases of *paralytic idiocy* atrophy of the brain on the opposite side produces marked asymmetry of cranial contour. (b) Amongst *traumatic* cases, forceps deliveries are reputed to be a common cause. Comparatively seldom, however is there any cranial defor-

(b) *Journal of Mental Science*, xxii. 261, &c. (Beach.)

mation; and less than two per cent. of 600 cases noted by me are attributed to use of forceps.

A "scapho-cephalic" (keel shape) distortion of the head is also occasionally observed in idiots, and is attributed to pressure in parturition. Large indentations in skull are sometimes produced by accident, as from kick of horse in case of idiot patient of Royal Albert Asylum, producing depression large enough to insert two fingers in occipital region. No general rule as to mental condition of traumatic cases can be laid down, the effects varying much with the extent, site, and severity of the pressure. Very considerable artificial deformation may be produced by prolonged, but comparatively gentle pressure, without any ill effect on the intelligence, as in the case of the Caucasian "Macrocephali" of Hippocrates.

ON THE PASSAGE OF THE OVUM FROM THE OVARY INTO THE FALLOPIAN TUBES. (a)

By R. J. KINKEAD, M.D.,

Professor of Obstetric Medicine at Queen's College, Galway.

THE mechanism of the passage of the ova from, and the spermatozoa to, the ovaries and fallopian tubes is a subject of interest in many respects, but especially in clearing up the duration of true pregnancy, and the etiology of abdominal and tubal gestation, and the migration of ova.

Two theories are discussed (1) the usually received one—that, in consequence of erection of the uterus and ovaries, during menstruation and sexual excitement, the pavilions of the tubes grasp the ovaries—(2) that the ova are conducted to the tubes through the canal in the tubo-ovarian ligaments, propelled by currents in the fluid which bathes the surface of ovaries and peritoneum and fills the tubes.

The first theory is objected to, because there is no evidence to show that there is an erection so powerful and prolonged at a menstrual period as to excite contraction of the muscular fibres in the layers of the broad ligament, sufficient to draw the tube to the ovary, and to keep it applied from three to five or six days, during which menstruation lasts.

That as erection is caused not only by increased afflux of blood to the organ, but by its efflux being prevented, such a prolonged erection recurring every month would produce structural change, and would be a pathological, not a physiological, phenomenon. That admitting that erection of the uterus and ovaries occurs under the influence of sexual excitement, the evidence that the tubes are drawn to the ovaries is very slight.

That we do not know that the ova are extruded from the Graafian follicle at a menstrual period. On the other hand, assuming that the changes in the uterine mucous membrane are preparatory for the reception of the fructified ovum, there are good grounds for believing that the rupture of the Graafian follicle usually occurs prior to menstruation, and therefore the grasping of the ovary by the tube at that period would be too late.

That we do not know that the phenomena attending sexual excitement cause extrusion of a matured ovum, and that granting that they may sometimes do so, yet as there are strong reasons for supposing that impregnation of the ova takes place at the surface of the ovary, or at the pavilion of the tube shortly after the ovum is extruded; and as the analogy of the lower animals shows that it takes some time for the spermatozoa to reach the ovary, this mechanism would only provide an uncertain and chance method.

That it further necessitates the assumption that pregnancy can only occur in those who experience

sexual gratification in coitu, and to account for those cases in which pregnancy results, where there is no sexual excitement; where intercourse is absolutely distasteful or painful; or where it has taken place under profound anaesthesia, to suppose that erection occurs independently of the feelings of the woman.

That this theory cannot explain those cases of migration of ova recorded by various observers, in which a corpus luteus was found in one ovary, and a pregnancy in the opposite tube or horn of the uterus, the tube corresponding to the ovary containing the corpus luteus being occluded.

That no mechanism exists by which the tube of one side could be drawn across the uterus and applied to the ovary of the other side, and that the close approximation of the abdominal contents renders this action exceedingly improbable.

Finally, that the theory supposes an imperfect, inconstant, and chance provision for the carrying out of the most important physiological function of a living being, totally at variance with the provisions made for the due and regular performance of the functions of all other organs.

The second theory, on the contrary, provides a channel of communication always available.

There is no cavity or empty space in the abdomen; all the contents are closely packed, friction being prevented by the exhalation of a thin layer of fluid.

From the ovary to the tube extends a fimbria longer than the other, grooved on its under surface; the approximation of the peritoneum turns this groove into a canal leading directly from the surface of the ovary to the pavilion of the tube—the fimbria of the tube keeps the pavilion evenly applied to the peritoneal surface and at the same time increases its area.

The capillary arrangement of the mucous membrane and the motion of its cilia, establish a current from the ovary to the tube. The quantity of the liquid bathing the ovarian surface is augmented, by that which escapes with the ovum when the Graafian vesicle ruptures, and probably by sexual excitement; and this extra fluid increases the current by which the ovum is drawn into the tube. Although the layer of fluid is very thin, yet both the ova and spermatozoa are very minute objects and have ample room to move about.

This theory also, affords a rational explanation of abdominal and tubal pregnancies, and of the migration of ova, and it has the advantage of indicating a channel of communication, regular in its action, at all times available, and perfectly independent of the sensations of the woman.

REMARKS ON SOME RECENT AND PRESENT VIEWS REGARDING FEVER IN INDIA.

By Surgeon-General C. A. GORDON, M.D.,
C.B., Q.H.P., &c.

(Continued from page 207.)

DURING the year 1879 there occurred in the British forces, Madras Presidency (a), twelve attacks by what was designated "enteric" fever, ten of the number fatal. With reference to the whites, it is stated that only eight were recognised during life as of that disease, the remaining four being so designated as the result of post-mortem examination. The cases recurred throughout the year, and their sporadic character is, to some extent, adverse to the notion that they were due to infection of drinking water or to latrines; enteric fever did not occur epidemically, nor did poisoning of a well nor infection of a latrine occur. According to a report from Bangalore, "no case of cholera or of enteric fever occurred during the year;" but in the description of a case of death by

(a) Abstract of paper read at the International Medical Congress, August, 1881.

(a) G. O. Madras Military Department, August, 1880, No. 5,823.

simple continued fever the observation occurs that "the symptoms and post-mortem appearances resembled those of enteric fever;" and, it is added, "extracts from other reports might be given to show that the writers, perplexed by the resemblance with some other cases of supposed malarial fever bore to enteric fever, had considered that a hybrid fever was under observation."

The following table shows the admissions and deaths from fevers other than eruptive among British troops in the Madras command for a period of ten years, in contrast with the same for the year 1879, namely:—

Years.	Strength.	Enteric Fever.		Simple Continued Fever.		Febricula.		Remittent Fever.		Ague.		Total.		Ratio per 1,000 of Strength.	
		Admitted.	Died.	Admitted.	Died.	Admitted.	Died.	Admitted.	Died.	Admitted.	Died.	Admitted.	Died.	Admitted.	Died.
1869	10,277	40	11	576	8	274	...	225	11	833	...	1,948	25	189.5	2.43
1870	10,783	44	14	362	1	375	...	51	7	3,389	...	4,821	22	449.1	2.05
1871	10,684	45	15	375	4	311	...	343	6	3,947	...	2,621	25	245.3	2.34
1872	11,511	79	26	1,041	4	458	...	79	3	1,823	...	2,980	34	267.6	2.96
1873	11,508	52	10	641	3	473	...	89	4	1,417	...	2,672	17	232.3	1.48
1874	11,578	34	12	756	...	566	...	43	...	710	...	2,108	12	182.1	1.04
1875	11,283	23	7	895	2	490	...	37	2	802	...	2,177	11	193.8	0.99
1876	11,132	51	21	966	4	540	...	33	...	586	...	2,176	26	195.5	2.34
1877	11,016	65	22	785	1	655	...	21	1	753	...	2,270	24	206.8	2.18
1878	10,880	7	5	1,241	12	693	...	175	8	1,592	...	3,708	25	340.8	2.29
Total	110,552	440	143	7,688	35	4,764	...	1,696	43	12,952	...	27,490	221	243.6	2.00
1879	10,507	12	10	998	8	372	...	189	5	2,604	1	4,175	24	397.3	2.28

The fact most perfectly brought out by this table is the recurrence of epidemic periods of fever. This is best seen in the death-rates. In 1870 our epidemic began, and it culminated in 1872. For the next three years the death-rate fell regularly. A second epidemic period began in

1876. No constant relation is borne by the number of enteric deaths to the total number of deaths from all fevers. The statement also occurs with regard to the cases of "enteric" fever recorded in 1879, that in their causation neither the influence of latrines, water, or milk. There was no evidence that the specific disease so named existed among native troops, nor beyond the allusion already noticed to epidemic years does any mention occur to the operation of those general influences usually designated endemic and climatorial.

In the course of comments (a) made on "Papers on Fevers in India," read before the Epidemiological Society, three questions are propounded, namely—1st. Is enteric fever, or fever with enteric complications, a new thing in India? 2nd. Is the fever, with enteric complications, the same as the disease known as enteric fever in Europe? And 3rd. If the two diseases are identical, are they due to similar or identical causes? To the first query a reply is given to the effect that the disease is not new, but its recent recognition due to "a more intelligent and exact differentiation," thereby assuming a superiority of the more recent observers over their predecessors, for which the authority is not apparent. Has it not rather been that one complication out of many occurring in the course of endemic fever has been selected as furnishing a specific name, that name indicative of a particular causation, assumed because hitherto undemonstrated? To the second, the writer observes that "there exists in India an enteric fever which resembles the enteric fever of Europe and America so closely in symptoms and pathology that the two diseases may, with reason, be pronounced identical." The symptoms here referred to, in Europe characteristic from the commencement of attack, occur in India as a stage of disease; and in robust men, after that of hyperæmia; in those of delicate frame and low physical power as a type due to individual condition. The pathological changes found in "enteric" fever in India are looked upon as in no respect differing from those which occur in fatal cases of endemic and diuretic fevers; in fact, very similar textural changes are produced by widely different systemic diseases (b). With regard to the third question, it is remarked that "the disease in Europe has been attributed to certain courses—to filth undergoing decomposition, and sewers and streets in which fecal filth mostly undergoes decomposition. In India there are, with few exceptions, no sewers and water-closets, and even where they exist the disease is not excessively prevalent," to which it is added that in England the pythogenic theory is now coming to be acknowledged insufficient to account for the occurrence of typhoid or enteric fever under all the circumstances in which it prevails, and is, moreover, in not a few instances, maintained by means of inferences and assumptions rather than by demonstrated facts; that "the fourth theory is really due to a name, and that, after a very anxious consideration of the evidence in favour of it, the conclusion arrived at is that there is really none worthy of the name" (c). In India, "specific causation being thus dismissed, 'climatorial' conditions are postulated, and the element of personal proclivity introduced;" and, be it added, both in accordance with recognised authority. Thus, according to the Royal Commission on the state of the army in India (d), fevers, diarrhœa, dysentery, diseases of the liver, are due to malaria, in conjunction with extremes of temperature, moisture, and variability—that is, to climatorial conditions. Is not also the question pertinent (e), Why assume the operation of pythogenic causes, the existence of which is matter of speculation, to the relative supercession of such no one present and manifest—namely, endemic and climatorial conditions? As to "personal

(c) My paper read before the Epidemiological Society.

(d) My paper read before the Epidemiological Society.

(e) Special Report II., p. 91.

proclivity," the grounds upon which importance is given to it connection with the phenomena of disease are fully entered upon in my Special Reports (a). As then stated, "According to the views expressed in the works of Indian medical officers, soldiers, and particularly those who are young and full-blooded, suffered from a fever, otherwise in its early stages, but in its latter complicated with visceral derangement, intestinal, that is, enteric among others, accompanied by a low, typhoid, or adynamic state; in those of weakly frame, asthenic from the first." And such, no doubt, is still the state of things. The acknowledgment is made that "we are not yet fully acquainted with the circumstances of the production of enteric fever." But according to reports by medical officers, quoted in my Special Reports, pythogenic causes in India were not traced, according to recognised authority, such causes in England are insufficient in all cases, and the theory will not stand; yet in India the tendency seems to be to cling to a theory of causation thus insufficient and abandoned, to the neglect of individual conditions and climatic influences, the power of which in regard to disease has heretofore been acknowledged.

According to Dr. Christian Bäumlér, of Freidburg, Baden (b), it is not always easy to say whether we have to deal with a mild case of enteric fever or with acute gastro-enteric catarrh, or its more developed form, "gastric fever." He alludes to the similarity in some of their principal symptoms, and the evident relationship existing between these diseases. He states, however, that in almost every case of "gastric" fever the diagnosis of "enteric" could be established, or the pyrexia of a remittent type traced to some other local disease, as of the lungs, and the gastric disturbance, not the cause, but a symptom of the febrile state. He is of opinion that a prominent character of enteric fever is enlarged spleen, a symptom which points to the infectious nature of that disease; that in many cases of "common acute enteritis," the symptoms very much resemble those of enteric fever; that in the former there may be more marked tympanitis and caecal pain than in the latter. Among the causes of gastric fever, that is "catarrhal inflammation of the gastric mucous membrane," he enumerates the use of indigestible food, excesses in alcoholic drinks, special disposition, and exposure to cold. He makes the statement that "cases of mild or abortive typhus may be undistinguishable from cases of mild enteric fever, the characteristic eruption absent in both," or coming on early and profusely in enteric. Quoting from Dr. Karl Huber, he observes that the ingestion of diseased meat may produce symptoms of acute poison like cholera, as also "of an acute infectious disease" resembling enteric fever, even to the eruption and post-mortem alterations, such as occurred at Selsten in Switzerland, in 1878, that is, "that the ingestion of putrid meat may produce symptoms and tissue changes in the intestines, which may easily be confounded with those of enteric fever." On this point the reviewer remarks that it is not improbable, though not yet proven, that enteric fever also is caused by some organised infective agent . . . contained in decomposed organic, and, more especially, faecal matter," whether such fever must always be derived from other cases, or are everywhere present, is a question still *subjudice*. With regard to this point, the recurrence is alluded to of "enteric" fever in localities into which the importation of the specific poison from a previous case could by no means be made out; and the remark added, "it is not impossible that what we now cannot but diagnose as 'enteric fever' may yet include several distinct diseases."

Surgeon-Major Don (c) observes that temperature "determines the true sub-tropics, whether of animal or vegetable life, or of diverse;" that "summer heat is the chief factor in the genesis and evolution of the endemic continued

fevers;" that "to broad general climatic influences rather than to mere local unsanitary conditions must we look—for much in the etiology of the endemic fevers." He describes the system of drainage at Gibraltar, with the remark that when some years ago this system was completed, "it was hoped that the notorious fevers of the 'Rock' would then disappear, but such expectation has not, unfortunately, been realised." Both in Gibraltar and Bermuda the populace are under the strictest police, military and sanitary supervision. The indigenous fevers of both these places, as also of Malta, Hong Kong, Mauritius, the Cape, and many parts of India are, according to his belief, "essentially the same." *Febricula*, according to Dr. Don, "is the seasoning or climatorial fever which very few Europeans escape during their early residence in the tropics." Its prevalence is often a prelude to an outburst of yellow fever, and is believed to indicate one of those pandemic waves of epidemic influence described by Inspector-General Lawson. *Simple* continued fever is by some writers looked upon as a misnomer and a paradox, for they do not believe in any continued or prolonged fever without a lesion somewhere. In Bermuda there is no malaria, yet cases of continued fever occur: in Gibraltar and Malta malaria does exist; anomalous hybrid fevers prevail in both these places, including gastric remittent as described by Dr. Marston.

With regard to enteric fever Dr. Don observes—"a few years ago it was perfect heresy to question, however deferentially, the views of the eminent exponents of the fever in England; now, however, doubts are partly freely expressed on its generally recognised causation." He therefore says, "Let us first come to some understanding as to what we severally mean by the term 'enteric fever.'" He takes as his definition "a continued fever presenting signs and symptoms;" the essential one in filtration, inflammation of the solitary or aggregated glands of the intestine; but with regard to "the fever of which the above is the characteristic complication," he observes, "the conclusion is irresistible that the chief change in the fatal type of intertropical continued fever is only one of name." He has often seen cases admitted under febricula changed to simple continued, and finally into enteric fever, just as in phenomena slowly developed, these three forms occur simultaneously, concurrently, and mixed up at the same time, in the same place or regiment or community. All three have the same seasonal period of prevalence, corresponding to the months of highest average temperature, and the maximum of solar elevation and power; hence may we not reasonably conclude that the causation of each is common to all? He doubts whether the occurrence of the phenomena of enteric fever depends on anything outside the patient, in Bermuda, while everyone, of whatever constitutional type, seemed liable to febricula or simple continued fever, the subjects of enteric fever were almost always those of strumous or tubercular tendency; hard drinkers were singularly free from it, probably because robust in habit. Can it therefore be that endemic cause acting upon persons of different constitutional type will give rise to different forms of climatorial fever? He observes that "youth and immaturity very strongly predispose to all forms of endemic tropical fever, and in Bengal about 75 per 100 deaths by 'enteric' fever happened during the summer and autumn quarters of the year." He cannot help thinking that "enteric" lesion is to be found in several forms of closely allied fever, "and that although anatomically specific as a lesion, it does not necessarily spring from only one specific cause." He believes that, as in England, so in the tropics, enteric fever, when epidemic, may also spread itself by means of air, food, or water; yet the theories of Budd and Murchison cannot, and do not, always and wholly explain the phenomena of sporadic enteric fever in Bermuda, Gibraltar, or an Indian cantonment. If the disease always has a filth origin, how do we account for its appearance on virgin soil, as in Zululand? In hot countries the theories of propagation or of pythogenesis applied to enteric fever often seems utterly at fault. In Bermuda Dr. Don had seen isolated cases of enteric fever which a filth theory alone could not possibly explain. If soil and water contamination be the cause

(a) I, p. 73, II., 226 and 244.

(b) *Dublin Journal of Medical Science*, November, 1880.

(c) Paper read before the Epidemiological Society, 3rd March, 1880.

of the disease, why should it be so only in summer and autumn?

Deputy-Surgeon General Ewart (a) states that in his experience the subjects of enteric fever in India were young Europeans residing in Burmah, Lower Bengal, and the North-West Provinces. He has seen the same disease among native prisoners at Ajmeer. It prevails in the same months as the worst forms of malarial fevers; he therefore considers that many "so-called remittents were simply typhoid or typhus fever modified or marked by malaria," also that remittent fever with diarrhoea is of this nature, death in intense cases ensuing "before ulceration of the agminated glands occurs." He believes in the characteristic nature of ulcerations of Peyer's glands in this disease. He is of opinion that the poison or *materies morbi* of enteric and of malarial fevers have no intimate relationship to each other; also that the poisons of typhus, typhoid, and relapsing fevers manifest non-identity among themselves, but that *malaria* is never the cause of enteric fever in India. He thinks, "it is not, perhaps, necessary to accept in its entirety the pythogenic theory of its origin, or the spontaneous generation of the poison," yet the pythogenic theory is unquestionably the best working hypothesis to explain the *endemic* prevalence of the disease. He holds that one specific poison is as necessary in the case of enteric fever as one specific poison is in the case of one of the exanthemata. He acknowledges in "enteric" fever the modifying influences of season, malaria, and temperature; on such a *hypothesis* he thinks the dissemination of the disease by infected air, water, milk, and other articles of food may become intelligible. The outbreak in Ajmeer was attributed to the insanitary condition of the gaol itself.

Dr. Russell writes: "In remittent fever (in India) the gastric symptoms are most prominent, while in typhoid the ileum and colon in the region of the ileo-cæcic valve especially suffer. In these two types of fevers the pyrexia frequently differs so little that often in India no conclusions of diagnostic value can be drawn from this symptom." (b) Here then it would appear that when in a case of malarial fever, gastric symptoms are prominent, Dr. Russell designates the case as of remittent fever, whereas he applies the term enteric to fever due to the same cause, accompanied by intestinal complication.

Dr. Collie (c) questions whether the cases at Clapham on which to some extent the specific theory of Dr. Murchison was based, were really cases of enteric fever. (d) He observes that in that disease death within the past week is extremely rare; that no acute disease of all our English acute diseases creeps so insidiously upon its victims as enteric fever. He also questions the applicability of the term *enteric* fever to the cases at Cambridge, described by Dr. Budd, although agreeing in the main with his views regarding etiology of that disease. From cases, details of which he gives, he allows a period of fifty-four days and upwards for incubation; that the disease is communicable by contagion; that the weakly and those in inferior health are specially liable to attack. He instances a house "noted during ten years for two things: defective sanitary arrangements, entire freedom from enteric fever."

(To be continued.)

It has now been decided by the Army Medical Department not to establish a Naval Depot and Sanitarium at St. Helena on the reduction of Ascension at the end of the year; but a medical officer will be retained at Ascension to take charge of the sick quarters which will be maintained there.

OPIUM AS A LUXURY, AND IN THE TREATMENT OF DISEASE.

By HERBERT PARSONS, M.R.C.S.,

Formerly Resident Medical Officer St. Mary's Hospital, London.

THERE is no drug we possess, more largely used, more wide in its range of action, or more diverse in its effects, than opium; and this being so, it must follow that the clinical success of a practitioner of medicine will be, to a very large extent, dependant upon his acquaintance with its powers, both for good and evil, and his skilful application of the same. Every day are heard of new purposes to which opium may be applied, and it now takes a place among many different classes of remedies; being, according to circumstances, a stimulant, tonic, sedative, astringent, anti-spasmodic, diaphoretic, convulsant, and purgative.

But besides its medicinal use, opium is very largely consumed as an article of indulgence; custom-house returns show that 200,000 lbs. of opium are annually imported into this country, of which not more than one-third, at most, can be used for pharmaceutical purposes. But, in this country, the habit of opium-eating is not nearly so prevalent as in the United States, nor, of course, nearly so much so as in some eastern countries, where the habit is almost universal. That the habit is not more common here is, perhaps, remarkable, for the immediate effects of it are far more pleasant and perfect than those of alcohol, while permanent injury to the system is not so certainly a final result. There is, in fact, no evidence to show that opium, in moderation, has any baneful influence on the animal economy; while the prevalent idea, that it is impossible to relinquish the habit of taking it when once formed, may be considered an exaggerated one. It is true, that with some persons, it is difficult, even impossible, to give up this, as it would be also to give up drinking, or other pleasant, though injurious, habits, but there is no more difficulty in the one case than in the others. Yet still the fact is to be looked at that after one, habituated to its use, leaves it off, he suffers for a time from a most intense depression and misery of mind, and besides, there is sure to result, in such a case, disturbance of digestion, and a colicky diarrhoea, although, under the opium régime, the intestines and stomach were in a natural state, or, at least, in a comfortable one. This constant diarrhoea will be found to be the bar, in some cases, to the abandonment of the habit. It is well known also, that in the same way, dram-drinkers, after long indulgence in the habit, suffer when their usual stimulant is withheld, although with it they may get on fairly well. The existence of a respectable moderate opium-eater is as practicable as of a moderate drinker, and I have no doubt that there are many men, who take opium occasionally, not only with or without any detriment, but with advantage.

As with tobacco so with opium; some will find it pleasant from the first, others only after they have accustomed themselves to its use, while to many it will always remain obnoxious. This difference may be due either to their mental or physical constitution. On some no doubt opium produces nothing but headache and nausea, and unpleasant cerebral excitement, none of that calm human-like bliss in which the opium-eater delights. But besides these, there are many who, although they experience the same feeling as others take delight in, yet enjoy it not, these are people of a strong nerve, and of that happy disposition to which to live a natural life is alone enjoyment, and to these anything which produces feelings different from ordinary, and takes them away for a time, as it were, from themselves is unpleasant. Another class are those whose minds, whether by nature, or by unhappy force of circumstances, are either never at rest, or else pervaded by gloom; these are often men of genius and splendid abilities, but it is from these, who take delight in anything which make them different from their usual selves, or will erase, if only for a time, black and gloomy thoughts from their minds, that the ranks of drunkards and opium-eaters are filled.

The difference of the effects of opium on a novice, and on one accustomed to its use, is remarkable. On the *habitus* it produces no constipation, headache, or dryness of the throat, but merely produces a pleasant effect, which lasts several hours, and then gradually passes off, leaving behind it no nausea or other disagreeable sensation. Let me attempt to describe those sensations in which so much pleasure are taken.

After a dose of the substance, in some in a few minutes, but usually after longer and longer intervals, the first effects begin to be felt; the eyelids feel unnaturally drooping and heavy, the limbs hang heavily like weights, the arms are lifted with an appreciable difficulty, and after often a distinct interval has elapsed from the time the will to move them was formed in the mind, reflex action is diminished, the face feels hot and gloomy, is, perhaps, flushed, the brain appears, as it were, to be felt working within the head, and conjuring up bright ideas; the things of this earth appear of little moment, thirst, pain, hunger, are not felt, or not heeded, life seems ideal, all its pleasures are felt, but not its pains. If the mind is left at peace, and undisturbed, a gradual drowsiness creeps on, and unless too large an amount has been taken, a sort of waking sleep results, in which, although not unconscious of external impressions, yet the internal ones are too engrossing to let them be much marked. But if the taker moves about, and mingles with others, this drowsiness is kept in abeyance, he feels happy with himself, and his mind is unusually brilliant, but his sparkling and semi-closed eyes, and shining face, reveal, to a close observer, his abnormal state. Yet his utterances are perfectly rational, and he retains complete control over his words and actions, though he eats without looking, moves without feeling the ground, his brain is stimulated as the faculty of enjoyment and intellect, but blunted as regards physical faculties.

This, then, is what opium can, and does do, for its votaries; firstly, free the mind and body from all painful and disagreeable sensations; secondly, stimulate the capacity of enjoyment; thirdly, sustain the mental and bodily energies through unusual and long-continued exertion. De Quincy, in his wonderful work, gives weird and true pictures of the pleasures he derived from this substance, but his descriptions can often not be relied on, or his experience applied to others, for his disposition was evidently a peculiar one, and his mind of a type not often met with; while undoubtedly he aims more at literary merit, than scientific accuracy in his accounts.

From this picture of opium let us turn to the others, and see what unhappy results may lay in store for those who take it. And here it may be remarked, the man, in robust health, leading an easy and natural life, is more likely to find opium disagreeable in its immediate and after consequences, than the man with an over-worked brain leading a life of worry and excitement. A dose of the drug, especially if large, as in the fluid form, may produce at once nausea and vomiting; but this is not common, more often it produces a feeling of pain across the abdomen, as if it were tied tightly round; there is a feeling of giddiness in the head, and restless and excitement may be the result, or more commonly a disturbed and broken sleep. This state, after lasting eight or nine hours, is likely to be superseded by nausea, frontal headache, constipation, dryness of the mouth and throat, and a general feeling of misery. To a large extent, the result following depends on the time of taking, and the conditions observed after it has been taken. A comfortable sleep is much more likely to be obtained if the opium be taken shortly before the usual hour of retiring, or if the taker lies down, and remains quiet, while, on the other hand, excitement and stimulation are much more probable under contrary conditions. Curious, but not unusual phenomena, brought on by opium, are the following: A minor degree of contraction of the muscles of the jaw, a sensation of coldness down the back, aching of the limbs, frontal and occipital pain of a dull character, nausea, and either general restlessness or drowsiness, followed by restlessness. Other effects sometimes produced, are inability to micturate,

priapism, pain across the loins, flushed and glistening appearance of the face, dyspepsia, and clay-coloured stools, which sometimes continues for days. Then, also, there sometimes occur diarrhoea, tetanic convulsions, delirium and diarrhoea, and itching of the skin and mucous membranes.

The same effects are not produced constantly on the same person; at times a person may take opium with comfort, while at another time, the same person may find the good results negatived, or nearly so, by one or more of the above drawbacks; or even when used to it, some of these unpleasant symptoms may become so prominent as to compel him to discontinue it; it may be the dyspepsia produced, in the pain in the belly, or urinary disturbance renders it unbearable. Constipation, though one of the most common results at first, yet in those inured to the use of opium is seldom present.

After continued use all these unpleasantnesses, as a rule, become trivial, and evils which now arise from excessive indulgence, are to be referred to its effect on the brain. No form of excitement can be indulged in, to a large extent, without entailing evil consequences to the nervous system, and opium is no exception to the rule.

These evil consequences consist in reducing the brain to a condition of abnormal excitability, alternating with one of intense mental depression, sometimes melancholia, sometimes a delirium tremens-like state is present. For a time these states are averted by a continued use of the drug, and only manifest themselves while the subject is not under its influence, but finally, nothing will stave off the evil day, except, perhaps, a discontinuance by gentle degrees of the poison. It must be noted that very frequently, those who indulge in excesses of opium do the same with other things, such as alcohol and chloral. The unfortunate wretches get into such a state that their food is alcohol, and their stimulant laudanum, while to procure sleep, they daily take large quantities of chloral. Such persons as these, from report and experience, I know are not uncommonly met with, and such as may be expected are rapidly brought to the very verge, if not past it, of mania. Great care has to be exercised in the treatment of these, should they be fortunate enough to come under proper control; but by a gradual deprivation of opium, and discreet administration of bromide of potassium, together with nervine tonics, and appropriate diet, a cure can usually be effected; though, unfortunately, when the control is removed, the patient is very likely to relapse into his old courses. In one case of this kind, the patient, a medical man, was known to take daily a pint of laudanum; a bottle or more of brandy, besides wine or beer, and chloral, two or three times.

(To be continued.)

Clinical Records.

LA CHARITE HOSPITAL, PARIS.

Case of Right Hemiplegia and Slight Aphasia—Almost Complete Destruction of the Third Left Frontal Convolution.

Under the care of Professor VULPIAN.

Reported by M. H. LÉLOIR.

A—J—, *æt* 72, was admitted November 29th, 1880, for chronic bronchitis. Generally in good health, he had been subject for some years to vague rheumatic pains, palpitations, and bronchitis. Two years ago, after an indefinite affection for which he came into the hospital, he was sent to a convalescent institution. Three days after his admission there he had an apoplectic seizure, followed by *right hemiplegia*, not strongly marked, predominating in the upper extremity, and a *certain amount of aphasia* (he found his words with diffi-

culty and hesitation, but, provided he was not pressed, could carry on a conversation). At the end of two months he quitted the hospital, slightly dragging the right leg, which was a little contracted, but able to walk easily leaning on a stick. After this he came into hospital several times for bronchitis.

At the present time (January 5, 1881) the hemiplegic phenomena have almost entirely disappeared; he walks well, and feels only very slight weakness of the right leg. The movements of the right upper extremity are intact; the right hand, however, is not quite so strong as the left (the patient is right-handed). No facial hemiplegia. The aphasic phenomena are not marked; he pronounces well all the words he wishes to speak, but sometimes has a difficulty in finding them, which irritates him; he very rarely replaces a syllable of a word by another different syllable. Memory is slightly diminished. No anaesthesia; no contraction; sphincter intact.

He has advanced signs of chronic bronchitis with emphysema. The beatings of the heart a little dull. On February 10th he was attacked with symptoms of suppurative catarrh, and died in the night of February 14th.

Autopsy.—The lung presented old lesions of chronic bronchitis with emphysema, dilatation of the bronchi, chronic pneumonia, &c.; no tubercle. Heart fatty; pronounced atheroma of the aorta. Kidneys affected with interstitial nephritis.

Brain: (Left hemisphere).—At the level of the two anterior thirds, the third frontal convolution is completely destroyed. There exists at this point a centre of softening, cystic in appearance, about the diameter of a two-franc piece, and one and a-half centimetres in depth. This centre is prolonged as far as the side of the insula, which is slightly affected. The upper part, in the form of a wedge of the third left frontal convolution at its inferior third, and from the point where it is continuous with the third frontal convolution is slightly softened in its superficial parts (softening about three or four millimetres deep). The other convolutions of the left side appear healthy, as well as the deeper parts of the left hemisphere. The right hemisphere is healthy.

Remarks.—This case would seem at first sight contrary to the theory of cerebral localisation. How, indeed, can we explain such a slight aphasia in a subject whose Broca's convolution was so much disorganised? This objection loses much of its value if we remember that the upper and posterior part, in the form of a wedge, of the third left frontal convolution was intact for a space about as large as a half-franc piece.

Special.

INDIAN MEDICAL SERVICE DEFENCE FUND.

The Report by the Indian Medical Service Defence Committee has just been published. The document shows that the Defence Fund was called into existence in consequence of the promulgation of G.G.O., No. 13, of January 2nd, 1880, followed by the intimation of the Under Secretary of State for India—"That it was not the intention of Government to offer any compensation whatever to the Indian Medical Service, other than the extra grade pension to the surgeons-general and to the deputy surgeons-general reduced under that order.

That this was resolved upon from the first is now in evidence in the Blue Book recently issued, where it will be seen that before the publication of the Royal Warrant of November 27, 1879, an arrangement had been made between the Secretary of State for War and the India Office, that the provisions of the Warrant should not be extended to India.

The measures of redress for grievances of the service which the Committee advocated are summarised under the following heads:—

1. The military surgeons general in India to be nominated alternately from the British and Indian Services.
2. Compensation to be granted to the senior surgeons major, for reduction in the number of administrative posts.
3. Equalisation of relative army rank with the Army Medical Department, and extension of the new grade of brigade surgeon to the Indian services.
4. Improved scale of pensions.
5. Abolition of examination for promotion to surgeon-major.
6. Improved rates of invalid pensions.
7. Abolition or modification of the system known as unemployed pay for junior officers.
8. Increased number of good service pensions.
9. Honorary rank on retirement after twenty years' service.
10. Honorary promotion to deputy surgeon-general of all officers appointed Q.H.P. or Q.H.S.
11. Increase in the number of decorations and honorary rewards.

No definite and satisfactory reply has yet been elicited from the Government with reference to the first of these points. An explanation has been afforded that it was never intended that Indian Officers should be permanently debarred from filling the post of military surgeon general in each Presidency, and that such promotion therefore is open to officers of either service. One, if not two, vacancies will occur within the next year, and the Committee hope that the Government of India will avail itself of the opportunity to prove that the "Instruction" published in the Army Circulars of January 30th, 1880, was issued in good faith.

The former grievances of the Service summarised in the above list under Heads 3, 4, 5, 7, 9, 10, have all been either fully or partially redressed, and, on the whole, the Committee are of opinion that the Government have on these points granted as much as could be reasonably expected. With reference to the grievance under Head 6, an Indian medical officer, compelled prematurely to retire on the score of health, is still less liberally treated than an officer of the Army Medical Department under similar circumstances; and to this point the Committee have again directed the Secretary of State's attention in their recent letter.

The claim by the senior surgeons major for pecuniary compensation, for injury to their prospects in consequence of the reduction in the number of appointments to Administrative rank, has been treated both by the Indian and Home Authorities in a high-handed manner wholly unworthy of the importance of the subject. The officers referred to have had their guaranteed rights regarding promotion set aside, and have been superseded by their juniors.

The hybrid position of brigade surgeon, entailing increased responsibilities, but conferring no extra military rank or additional pay, is no compensation for men, ten of whom would now have been deputy surgeons-general, had no reduction in the guaranteed number of that rank been made.

Nos. 8 and 11. The Government of India have promised that an increased number of good service pensions shall henceforth be allotted to the Indian Medical Service, and that the claims of its members for honorary rewards and decorations shall be more carefully regarded in the future. The Committee are glad to see that the Government has already shown some desire to redeem this promise, by conferring the distinction of K.C.S.I. on a former revered Chief of the Department, and by decorating four other officers with the Companionship of the Indian Empire.

The majority of the objects for which the Fund was formed have now been attained, and the Service as a whole has greatly benefited from the changes effected during the past eighteen months, inasmuch that, with a very few exceptions, the pecuniary prospects of every member of the Service have been materially improved.

Under these circumstances, at first, the Executive contemplated a dissolution of the Committee; many of their friends, however, have urged that it would be inopportune to dissolve altogether at a time when a scheme for the

unification of the Services is under consideration, as *experience unfortunately demonstrates that the Indian Service has no official representative in this country*. They have therefore decided to keep the Fund together for the present, but in a passive form. In other words, the machinery of their organisation will be maintained intact, but thrown out of gear for the present.

The Executive Committee tender their most grateful acknowledgements to the public bodies and individuals, to whose powerful aid and co-operation they are mainly indebted for the attainment of the success now recorded.

To the universities and medical corporations of the United Kingdom, which, without an exception, have thrown their great influence heartily into our cause. To the British Medical Association, which has rendered throughout invaluable support, and to the Chairman of its Parliamentary Bills Committee, Mr. Ernest Hart, our especial thanks are due.

The public press both of the United Kingdom and India has warmly advocated our cause; and special acknowledgment is due to *Allen's Indian Mail* and the *Home and Colonial Mail* in this country, and to the *Civil and Military Gazette* (Lahore), and all the daily journals of the Presidency towns in India.

The medical press of this country has been earnest and persistent in its advocacy of the claims of the Service. A solitary medical journal in India has adopted a different policy, but as its existence depends in a large measure upon subsidies received from the Governments of India and Bengal, the tone it has adopted is perhaps scarcely a matter for surprise.

The Committee then tender acknowledgments to various Members of Parliament and other influential men who have advocated the cause of the Indian Medical Service.

FRANCE.

[FROM OUR SPECIAL CORRESPONDENT.]

DEAD FŒTUS SIX MONTHS IN UTERO.—At the Académie de Médecine M. Depaul presented a fœtus which, dead at five months, sojourned in the uterus eleven months, that is, six months after its death. It is the first time that M. Depaul during his long experience, had seen such a case. He had often met with a dead fœtus expelled a couple of months after death, or at least at the end of the forty weeks dating from conception. However, the accouchement was spontaneous and very rapid. The fœtus was expelled with the membranes, which were intact, and when the mass was opened no offensive odour was emitted. This latter fact would seem to prove that as long as the membranes are entire the contents do not putrefy.

TALIPES EQUINUS.—M. Jules Guérin presented a child who was affected with talipes equinus of the left foot, and talipes valgus of the right. All the tendons interested in these deformities were divided subcutaneously by the intrepid octogenarian, and the result was very satisfactory. M. Guérin presented this case as a specimen of the varieties of club foot, which are very rarely encountered in the same subject.

HYPERTROPHY OF BOTH BREASTS.—At the Société de Chirurgie M. Monod presented a woman, four months pregnant, who exhibited an enormous hypertrophy of both breasts. It is the third time that this woman is *enccinte*, and both the preceding pregnancies presented a very notable hypertrophy of the two mammary glands. After confinement her breasts came back to their normal size. The period of her actual pregnancy, with the cachectic appearance of the patient, and the enormous volume of the glands repelled all idea of surgical intervention. Tincture of iodine with compression, proved ineffectual. Under those conditions M. Monod asked the society if it would not be better to consider this woman as having a deformed pelvis, and consequently provoke abortion. M. Despres thought it would be better to wait and, in the meanwhile, perform artificial section. M. Sée could not understand the proposition of the last speaker, as section would be immediately followed by the lactic secretion, which

would only exhaust the patient still more. M. Heurtoulop agreed with M. Monod that considering the grave state of the woman it would be better to sacrifice the child.

INCREASE OF PULMONARY PHTHISIS.—M. Resnier, in his second quarterly report upon reigning maladies, observed that pulmonary phthisis was on the increase. Diphtheria is making incessant progress, small-pox was on the decline, but erysipelas had increased. As to typhoid fever it offers an unheard of exacerbation.

ACUTE EFFUSION INTO THE PERICARDIUM.—Prof. Rosenstein reports the case of a little boy, æt. 10, who presented on his entry into hospital symptoms of acute effusion into the pericardium. An exploratory puncture was made with an ordinary subcutaneous syringe, and the contents were found to be purulent. The symptoms becoming increased a second puncture was made with the Potain aspirator, and a large quantity of pus was drawn off. Acute pleurisy followed, which necessitated two successive punctures in a few days afterwards. At the same time the signs of purulent pericarditis reappeared with its primitive intensity. It was thus that M. Rosenstein decided on opening the pericardium under the protective influence of the antiseptic spray. An incision of little more than an inch in length was made between the fourth and fifth rib. The pericardium was opened with a sharp pointed bistoury, and the wound increased by a blunt-pointed bistoury which gave issue to a great quantity of pus. Two drainage tubes placed in the wound and Lister's dressing completed the operation. As far as the pericarditis was concerned the best results were obtained, not so with the pleurisy which necessitated the operation for empyema. The wound cicatrised in the pericardium in nineteen days and in the pleura in eleven days, and the little patient made a perfect recovery.

TREATMENT OF ERECTILE TUMOURS.—A great many means are proposed for the treatment of erectile tumours, but M. Bouchut, of the Children's Hospital (Enfant Jésus), Paris, limits himself to touching the tumour with a wire of platinum steeped in monhydrated nitric acid. The little operation was renewed three times on three consecutive days, at the end of which a black crust formed upon the tumour. At the end of a month this crust fell off without suppuration, and the erectile tumour was cured.

ANTI-BLENNORRHAGIC INJECTION.—As an anti-blennorrhagic injection the following is recommended—Hydrate of chloral, 20 grs.; rose water, 4 ozs. At the end of three or four days' treatment the desire to urinate is less frequent and less painful; the erections are equally less painful, while the purulent secretion becomes more and more clear, ceasing completely on the eighth or tenth day.

Department of Lunacy.

FORMS IN USE FOR THE ADMISSION OF PATIENTS INTO IRISH DISTRICT ASYLUMS.

By OSCAR T. WOODS, B.A., M.D.,
Medical Superintendent, Killarney Asylum.

I HAVE for some years thought that much improvement might be effected in the mode of admission into Irish district asylums, and I think the present a very fitting time to draw attention to the subject, as Mr. Litton last session introduced into the House of Commons a Bill "to extend to Ireland some provisions of English and Scotch law as to the care of Lunatics." The necessity for such a Bill has I believe long been felt, and I think its benefits might be still further increased, by the addition of a few clauses. The Poor-law Union and Lunacy Inquiry Commission, presented its report in 1879, and I find from it that thirteen out of the twenty-two Irish superintendents *condemned* the form under which so-called "dangerous lunatics" are committed, and only one superintendent *approves* of the form.

Two forms are at present in use for the admission of patients:—

1. That for "dangerous and criminal lunatics" under 30 and 31 Vic., cap. 118, sec. 10.

On this form the patient is committed, by two magistrates, on a sworn information that the person has been arrested, "under circumstances denoting a derangement of mind, and

a purpose of committing an indictable crime," and the certificate of a medical man.

2. Form E. "Application for admission," in accordance with Privy Council rules.

This requires a declaration by the friends, a certificate signed by a magistrate and clergyman, and a medical certificate. There are, I think, serious objections to both these forms.

Criminal Form.—1. There is a manifest injustice in making a criminal of a diseased patient, who is always classed as such while in the asylum; and when comparison is made with English criminal statistics the result seems incomprehensible. 2. It hands nervous and diseased patients, whose prospect of recovery may be altogether blighted by a fright, or injudicious treatment, over to the hands of the police. I have, on several occasions, found this to act most prejudicially against their recovery. In many counties, not however in this, females are sent long journeys in the sole charge of the police. 3. Inability to demand payment for the patient's maintenance; no matter what the patient's circumstances are, his friends cannot be compelled to pay for his support. I believe there are many patients in Irish asylums whose friends would be compelled to contribute to their maintenance were they confined in England. 4. The utter impossibility of obtaining any reliable information about the patient, the escorting police having been changed more than once on the journey; occasionally there has been no change, but even then they are able to give little, or no trustworthy information; scarcely ever is the patient accompanied by a relative. Thus the medical officers have to treat the case altogether in the dark, as the information given on the form is small indeed.

According to Dr. Hancock's report for 1878, on the Irish criminal statistics, there were but three lunatics committed by justices in England as dangerous and criminal, under Act 1 and 2 Vic., c. 14, whereas in Ireland for the same period there were 1,204 committed under 30 and 31 Vic., c. 118, which was drawn on the lines of 1 and 2 Vic., c. 14. He thus writes "The difference appears to arise from the justices in England and Wales having power, under the Lunatic Asylums Act of 1853, to send a pauper lunatic to an asylum on a certificate that he is deemed to be a lunatic, and a proper person to be sent to a lunatic asylum, and to send to asylums lunatics (whether paupers or not), wandering at large, not being properly cared for, or being cruelly treated; and from the stringent penalties on medical officers and overseers of the poor, &c., who omit to give notice, so as to have the above classes of lunatics brought before justices. The justices have, consequently, not to wait for evidence of "derangement of mind accompanied by an intent to commit a crime," in order to commit a lunatic under the powers conferred on them by the English act of 1837 (1 and 2 Vic., c. 14). In Ireland justices have no powers similar to those under the English Lunatic Asylums Act of 1853, of sending lunatics as such to asylums. Their power, under the Irish Act of 1867 (30 and 31 Vic., c. 118), is founded on the earlier English Act of 1837, and not on the later Act of 1853, and is limited to the case of persons who have derangement of mind, and intent to commit a crime, and who are dangerous lunatics, or dangerous idiots."

The inspectors of asylums have, in several of their annual reports objected to the working of the Act; in their Report for 1874 they write—"In former reports we adverted to the inconsiderate manner, to use a mild term, in which magistrates committed lunatics to asylums as dangerous, in many instances not taking the trouble to make proper inquiry into the merits of the case, in others acting without a due regard to the provisions of the statutes, clear and definite in themselves." Again, in their Report for 1877, "As in preceding years considerably more than one half of the admissions was effected through magisterial warrants, the patients not infrequently advanced in life, and it is regrettable to add, occasionally in the last stage of existence, and conveyed by a police escort from 30 to 40 miles." "We have done all in our power to check the abuse and obviate irregularities, which lead to much practical difficulties in the treatment of the insane, owing to the want of satisfactory information on the face of the committals." My objections to Form E are—1. The Privy Council Rules direct that this form should be laid before the Board as an "application for admission," the superintendent is empowered in case of urgency to admit a patient on his own authority, and to "submit the case for the special consideration of the Board at its next meeting for the decision of the governors thereon." This rule evidently meant that

superintendents were only to exercise this authority occasionally, but it has evidently been found impossible to act up to the letter of it, for during the year 1879, 870 patients were admitted as urgent by the medical officers, and only 114 by order of the Board. 1,277 were, the same year, sent in as criminals. 2. As the form has first to be applied for at the asylum, then "filled up and transmitted to the asylum previously to the lunatic being sent to the institution," no case from a distance, no matter how urgent, can be admitted on it without considerable delay. 3. Few people are aware of this form—the majority knowing of no way of sending a patient to an asylum, except as a "dangerous lunatic."

Both forms are often inaccurately and insufficiently filled, the medical certificates contain little or no information, and rarely are there any facts observed by the medical attendant given. There is no limit laid down as to the length of time a certificate will hold good for, nor is the certifying medical man required to have seen the patient within any definite period. Dangerous lunatics are generally sent to the asylum without delay, but, on one occasion a patient was brought to this Asylum on a committal dated three weeks previously, I had no power to refuse admission, even had I found the patient sane. Some time ago a patient was brought here on an application form two years old; I refused admission, and the same day the patient was sent in as a criminal lunatic. Frequently there are mistakes more or less serious in the certificates, but no one is responsible for their correct filling up, and the superintendent has no power to enforce correction. Many people believe it is quite unnecessary to have any admission form filled for a relapsed case, no matter how long the patient has been at home well. I do not believe there would be any inconvenience caused by the adoption of the English form of admission, which requires the certificate of a medical man, a statement signed by the relieving officer, and the order of a magistrate, the admissions would not be materially increased, when the friends are now anxious to get a patient into an asylum they have no difficulty in making him out a criminal, every lunatic is, in a sense, dangerous, and at times cross, and I have never known any difficulty raised. A harmless idiot was sent me not long ago as a dangerous lunatic, although only 10 years old, he was afterwards transferred by the governors to the workhouse.

Sec. 78 would regulate the form of admission, and limit the time within which the medical witness should have examined the patient. At present there is no limit. This section would also make it a misdemeanour to remove a patient without certificates, and there are, I believe, many patients in Irish asylums who have been removed without any, the majority of these no doubt being relapsed; but because a patient has been once confined in an asylum that is no reason for putting him into one again without fresh certificates. Sec. 75 would necessitate greater regularity in the filling up of the medical certificate. Sec. 80 would facilitate the discharge of patients and put the responsibility of removing them on the relieving officers instead of, as at present, on the asylum authorities. Friends frequently refuse to remove them. Sec. 124 would define the penalty for ill treatment, at present no Lunacy Act extending to Ireland bears on this question, and last year when I was compelled to prosecute some attendants for cruelty to a patient, I found considerable difficulty in having them convicted of a common assault.

I may now be excused if I refer shortly to Mr. Litton's Bill, the main provisions of which are, firstly, the supervision of neglected lunatics; secondly, the boarding out in suitable places under the direction of the governors of such patients as they might select for that purpose; thirdly, an alteration of the law of committal; and fourthly, power to the Poor-Law guardians to give out-door relief. I cannot think that the boarding-out system will act as well in Ireland as it has done in England and Scotland; lunatics in this country require much more care and supervision; they are all, as a rule, more destructive, troublesome, and dirty than English and Scotch patients; the majority of harmless chronic patients are most untidy, and, if ill-managed, irritable and dangerous. With lunatic patients it may truly be said that "a soft answer turneth away wrath;" and I think it will be impossible to find in most country districts suitable persons to take care of them. Certainly, the majority of Irish cabins are not desirable homes to teach habits of cleanliness and industry. Indeed, I think there will be little anxiety on the part of the people as boarders. Could not the recommendations of the Poor-Law Union and

Lunacy Inquiry Commission be carried out in a modified form; I cannot think they would be found to operate well in their entirety, chiefly for the reasons so clearly stated by Dr. Nugent in his letter to the Lord Lieutenant, and published in the Report of the Lunacy Inquiry Commission, and also because that in every asylum there must be a large number of chronic incurable patients who give assistance not only in cleaning the house, but also in taking care of the other patients. If only curable patients were to be kept in an asylum the expenses would be more than doubled. I do not believe the large number of incurable patients in Irish asylums diminish the recoveries, the proportion is not greater than in England, and the percentage of recoveries is far greater in the Irish asylums, being for 1879 51·3 per cent. calculated on the admissions, whereas they were but 35·6 per cent. in the English asylums according to the Report of the Commissioners for 1875—the latest report I have at hand.

I think, however, the third recommendation of the Lunacy Inquiry Commission might with very great advantage be carried out, "That for the quiet and harmless provision should be made in portions of the workhouses set apart and suitably fitted for the purpose of auxiliary asylums." Provision could thus be made for many lunatics at present quite neglected, and for many cases selected from the inmates of the asylums. These patients in order that they might have the necessary care should have a special staff—two attendants for every patient at least—and should be grouped as much as possible together, it would be no great matter if they were removed from their own county if it was found necessary, for, as a rule, patients are forgotten by their friends when confined for eight or ten years. The auxiliaries should, I think, be inspected frequently by a special staff; assistant inspectors might be appointed as in Scotland; or, when the auxiliary was not too far from the county asylum, the superintendent thereof might be appointed to make periodical reports on its management, &c.

Translations.

ANTHRAX INOCULATION.

Translated from the *Union Medicale*,

By ARCHIBALD HAMILTON JACOB, M.D. Dub.,
F.R.C.S.I.

A COMMUNICATION was submitted to the Paris Academy of Medicine on the 14th of June by M. Pasteur, entitled "Summary of Experiments made at Pouilly-le-Fort, near Melun, on Vaccination for Anthrax." This pamphlet was the work of M. Pasteur, aided by MM. Chamberland and Roux, and the author referred to a communication made by him to the Academy on the 28th of last February, relative to the discovery of a means of preparing the attenuated virus of anthrax. He expressed himself as follows:—"Each of our inoculations of attenuated anthrax virus acts in the nature of vaccine lymph towards the more concentrated anthrax virus—that is to say, as a virus suited to cause a slight attack of the disease. What is easier, therefore, than to find a virus the strength of which shall be such as to induce anthrax fever in sheep, cows, and horses, an attack not sufficiently powerful to cause death, but which will ultimately preserve them from a deadly attack of this disease. We have practised this operation with great success on sheep. As soon as the time of year for feeding the sheep within enclosures in la Beauce arrives, we purpose to experiment on a larger scale."

Since last April the Agricultural Society of Melun has furnished M. Pasteur with opportunities of experimenting very largely. Through the President, M. le Baron de la Rochette, the society proposed that M. Pasteur should endeavour to obtain decisive proofs of the statements made by him to the Academy. M. Pasteur agreed, and the following arrangements were made:—

1. The Agricultural Society of Melun shall furnish M. Pasteur with 60 sheep.
2. Ten of these sheep not to be subjected to any treatment whatsoever.
3. Twenty-five of these sheep to be inoculated twice, a period of from 12 to 15 days intervening between each inocu-

lation, the virus on each of these two occasions being of different degrees of attenuation.

4. These 25 sheep, as well as the twenty-five remaining sheep, to be inoculated with virulent anthrax virus after an interval of from 12 to 15 days. (These experiments should give the expected results, the 25 non-vaccinated sheep should all perish; the 25 vaccinated should all recover, and on being compared with the ten sheep reserved, should be found to have returned to their normal condition).

5. After the general virulent inoculation of the two sets of 25 sheep, the whole 50 to be placed in the same building; the sheep belonging to one set to be distinguished from those belonging to the other by boring a hole in the ear of each vaccinated sheep.

6. All those sheep dying from anthrax to be buried one by one in distinct holes, close to each other, within a fenced enclosure.

7. In the month of May, 1880, nine new sheep to be put to graze within this enclosure, so as to prove that these nine sheep will contract the disease from the anthrax germs brought to the surface by earth-worms.

8. Twenty-five other sheep to be placed in a neighbouring enclosure at a few yards distance from the first, within which no diseased sheep have been buried, so as to prove that none of them will die from anthrax.

According to the wish of the Society, eight cows were directed to be experimented upon, and also an ox and a bull. It was decided that six of these animals should be vaccinated, four left untouched, and that at the same time as the 60 sheep the whole ten should be inoculated with virulent virus.

The experiments began on the 5th of May in the commune of Pouilly-le-Fort, near Melun, and on the farm of M. Rossignol, veterinary surgeon. Two of the sheep were replaced by two goats. On the 5th of May, 1881, 24 sheep, a goat, and six cows were inoculated by means of a Pravaz syringe, each animal with six drops of modified attenuated anthrax virus.

On the 17th of May these 24 sheep, the goat, and the six cows were re-inoculated with a virus more virulent than the first.

On the 31st of May the most virulent inoculation took place, which should decide whether the previous preventive inoculation of the 5th and 17th were efficacious or not. Therefore the 81 previously vaccinated animals, and 29 non-vaccinated animals, 24 sheep, a goat, and four cows, were inoculated with a very virulent virus.

In order to render the experiments more comparative, a vaccinated and a non-vaccinated animal were alternately inoculated. The operation over, a meeting was arranged for Thursday, June 2nd, consequently, 48 hours after the general virulent inoculation. On the arrival of the visitors, June 2nd, the 24 sheep and the goat, vaccinated with attenuated virus, as well as the six cows, appeared to enjoy perfect health; on the contrary, the 21 sheep and the goat, which had not been vaccinated were already dead from anthrax; two more of the non-vaccinated sheep died before the eyes of the spectators, and the last of the set died towards the end of the day.

The non-vaccinated cows were not dead, but all suffered from voluminous adenoid swellings round the point of inoculation, behind the shoulder. Their temperature had risen 3°. In the vaccinated cows there was no rise in temperature, no tumours, no loss of appetite, which renders the experiments as satisfactory for cows as for sheep. On Friday, June 3rd, one of the vaccinated sheep died. A *post-mortem* examination was made the same day by M. Rossignol and by M. Gerrouste, army veterinary surgeon. The sheep was found to be big with young, at full term, the lamb dead within the matrix for 12 or 15 days. The opinion of the veterinary surgeons was that the death of the sheep was to be attributed to the death of the fetus.

These experiments were witnessed by several hundred spectators, among whom were several veterinary surgeons. Finally, says M. Pasteur, we now possess anthrax vaccine matter capable of preserving from mortal disease, and not in itself mortal, which can be modified at will, which can be carried without alteration, and, finally, which can be prepared in a manner capable of generation, having already been employed in the preparation of vaccine matter for chicken cholera. By the character of the conditions here enumerated, and viewing matters from a scientific point of view, the discovery of anthrax vaccine constitutes a sensible progress on Jennerian vaccine, as the latter has never been obtained experimentally.

The Medical Press and Circular.

“SALUS POPULI SUPREMA LEX.”

WEDNESDAY, SEPTEMBER 14, 1881.

DANGEROUS PRECEDENTS.

THE historian of the second half of the nineteenth century will oftentimes, during the course of his labours, be puzzled to harmonise his record of contemporaneous events. Frequently will he find himself hesitating between acceptance of a fact, and its rejection on the ground of high antecedent improbability; but in no domain will he be again and again so seriously nonplussed by the divergent evidence at his hand, as in the field of medicine in its social bearings. At this time, “the Englishman, of average intelligence,” even would be at no loss to indicate briefly, even though he failed to appreciate, the primary law of safety in regard to infectious diseases. The veriest dunce would immediately declare his intention of putting this principle into practice by avoiding contagion if possible, when once its source is pointed out to him, and yet we are repeatedly treated to exhibitions of the crassest ignorance respecting the proven facts of daily occurrence on the part of those who, by a reversion of every propriety, occupy positions whence they are enabled to achieve irremediable mischief. The fanatical crusades against the advance of science, initiated and supported by the ignorant mob of anti-vaccinators and anti-vivisectionists, are not the least strange of the more startling

events of recent years; they are admitted and deplored by all who are interested in the progress of scientific discovery. Nor can it ever escape the historian's eye how there are many like him who, in the words of Dr. Bristowe, is “a great judge,” “and who, throwing off the judicial impartiality which befits a judge, and acting under the influence of prejudice, emotion, and ignorance, has made himself the leader of all the hysterical sentimentalism of the day in a crusade against experimental physiology in the land of Harvey and Hunter.” These it is who work most mischief, who, with the power of intellect and of position, which, in appropriate place, marks them as pre-eminent among the guides and directors of the people, are yet unwisely bent on the prosecution of tasks beyond their professional sphere, and for which they possess no possible qualification. This spirit of wrong they radiate around them the more distantly, the more highly placed they are, and we do not wonder that the example set by a legal functionary, who is justly regarded as a well of wisdom, should influence an innumerable series of the lesser lights beneath him. It may, perhaps, seem an improper stretch of suggestion, that there may be a distant connection between the antipathy to vaccination; for instance, entertained by not a few magisterial authorities, and the tendency of their judgments. Should this be so, and we could point to several recent instances in support of the supposition, it becomes a matter of public concern to inquire into the operation of such a factor in determining the spread of disease; and in this relation a case came under review by the Greenwich Bench last week, which is capable of supplying a cogent argument against the apathy of anti-vaccinationists, as well as one in favour of stricter medical supervision in the matter of disinfection. The case referred to was that of a man, of whom the summons complained “that his house and premises require to be cleansed and disinfected, several cases of an infectious nature having occurred there, and he having neglected to carry out the disinfection of the said house and premises in pursuance of notice served upon him.” According to the statement of Mr. Stokes, who prosecuted on behalf of the Rotherhithe Vestry, the defendant is a prominent leading anti-vaccinationist, and had successfully evaded the vaccination laws. Eight cases of small-pox had occurred in his house. A young child first took the disease, and was nursed by his wife. It recovered, but the wife was seized and died, two other children also succumbing. The defendant borrowed a suit of clothes from a young man in an oil-shop opposite to attend the funerals, and after he had returned them the young man was attacked with small-pox and died. Four other children of the defendant were stricken, three of whom were taken to the Deptford Small-pox Hospital, on a compulsory order of the magistrate, defendant steadfastly refusing to permit their removal before. In the houses surrounding the defendant's sixteen other cases subsequently occurred. Defendant had been applied to respecting the disinfection of his premises, and said it had been carried out, but he failed to produce a certificate from a medical practitioner, as required by the Sanitary Act, 1866.

The disinfection carried out was not of a kind to satisfy the sanitary authority, and it might, with reason, be urged that the sanction given by it could alone be trusted to to secure the public safety in such circumstances. The magistrate, in this case, was specially requested to do all in his power to strengthen the hands of the sanitary authority, and it might have been thought that the ghastly tale of death and disease, brought about by obstinate ignorance, would have rendered any such appeal if not unnecessary, at least effectual. Notwithstanding, however, the magistrate, to whom it had been proved that the defendant, by his anti-vaccinating propensities, had indirectly caused the death of at least four persons, after observing that "there seemed to be a certain amount of feeling in the matter," failed entirely to perceive negligence on the part of the defendant, and *dismissed the summons*.

We say, with justice, that such facts as these, taken with the luminous expositions accessible to the popular mind, of the nature of small-pox, will be among the most extraordinary with which the student of the history of our time will be concerned; and the misfortune is, that the spirit displayed in the ruling referred to, is by no means confined to Greenwich. Within a week we find that vendors of quack medicines, of the most unblushing description, are discharged without the formality of a defence being required of them by the local justiciaries, and immediately after they are rapturously received by an impatient crowd, eagerly waiting, to welcome them back. Again, we find a provincial bench of magistrates of opinion that a flagrant violation of the sale of Poisons Acts can be justly met by the imposition of a ten shilling penalty; and other cases bearing the same moral might be cited. All this points to one irrefutable conclusion, that, viz., the opposition to truth and progress is gaining headway in directions where it might be least expected, and that medicine itself has nothing to hope for from a maintenance of its integrity outside of itself. Nor, it is to be feared, are the attacks made on it by insidious means, only from without. Recent experiences point rather to another conclusion, and this should, indeed, strengthen anew the efforts of those who are anxiously regarding the future of the profession in this country. Perhaps among the blessings in its wake, the late Congress will bring a higher appreciation of the value of scientific medical testimony to the minds of local magistrates; but the evidence of it is wanting as yet.

UNION HOSPITALS AS TEACHING INSTITUTIONS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Though satisfied that most of your readers will accept the letter quoted in your leader as conclusive on the point of union hospital guarantees, yet, as the whole subject cannot be too thoroughly ventilated, I will again trouble you with some remarks. In that letter I dwelt on the only securities which the present order of things afford the students of existing clinical hospitals. These are, first, the free circulation of opinion among students, and second, the proofs afforded by the final clinical examinations. I pointed out that these examinations would afford the amplest means for testing the teaching of union hospitals, since if the students broke down at these examinations in that part of the subjects which they were supposed to have learned at such hospitals, then the

teaching of those latter would, *ipso facto*, be condemned. It might be alleged that the ill-trained union hospital youth might make up for his defective training by working double tides in Dublin, but I think that I have satisfactorily shown that he could not do this without being instantly found out by his brother students, and by his clinical teacher, who would be all alive to aim a blow at the fruits of the newly acquired privileges of his despised country brother, though albeit it might be quondam teacher.

Will not, therefore, country hospitals be subjected to the same criticism, and the same tests, as your heaven-born ones; nay, will not the criticism be much keener, seeing that the rurals will be *rari nantes* in the midst of bitterly inimical elements? Now Mr. Editor, allow me playfully to ask you how do you reconcile this hair-splitting about union hospitals with your attitude towards the other country hospitals, referred to in your quotation from the Regulations of the Dublin College? It seems quite clear from the context, as well as from your own silence, that you approve of these regulations, and yet what securities do those offer that the teaching in those institutions shall be value for the time and money of the attending students. Why they simply enjoin a biannual return of their students. Do you allege that the officers of those institutions are composed of different molecules from those which enter into our composition? There was a time when country surgeons advanced such pretensions, but the intelligent among them now are satisfied to base their claims to superiority on individual merit, and not on the particular pocket of the taxpayer, from which the support of the individual hospital is derived. What is sauce for the goose is sauce for the gander, and it would be only just that all hospitals should give security for competent teaching. Dr. Mapother, however, in his fierce onslaught on the new rules, stated that all country hospitals were now shut out, and on looking over the rules, he appeared to be quite correct. Here, then, is a march stolen on one branch of the monopolists.

Neither I, nor my distinguished *confères*, ask any privilege for which we are not prepared to give ample security, and though the notorious shortcomings of many recognised hospitals make it indispensable to the public interest that such securities should be exacted all round, yet I will now formulate those practical proposals which are contained in my former letters, and which I have reason to believe, express the views of my *confères*. As they are identical with your own, I confidently appeal to you to get them accepted by the Irish College of Surgeons.

1. That one year's attendance at union hospitals be recognised.
2. That this year shall be the first of the student's clinical course.
3. That such recognition shall be dependent on the students passing a defined clinical examination.
4. That such examination shall be held after the student has passed the first medical examination, and before he enters on any further part of his course.

I am, Sir,

Yours, &c.,

Cashel, Sept. 8th, 1881.

THOMAS LAFFAN.

Applying Dr. Laffan's own tests of the teaching capacity of union hospitals—(1) the free circulation of opinion, and (2) the final examination—we venture to ask how there can be a "free circulation of opinion" in reference to institutions whose students would never, probably, exceed half-a-dozen? And how does Dr. Laffan suppose that the break-down of one or two students at the examination would affect the union hospital at which they were supposed to learn their business? The influence which compels large hospitals to teach well is simply the competition which they have to meet. The teaching staff in these institutions would starve if they neglected their work—in such case the class would at once seek instruction where they got better value. But this influence is totally absent when provincial hospitals come to be considered, because, as a matter of fact, there could never be more than three or four students, and these could not possibly migrate to a

better teaching centre ; nor could the ultimate examination possibly check the shortcomings of the teacher, although it might punish the unhappy student.

We decline to be drawn by Dr. Laffan into an invidious comparison between county infirmaries and union hospitals, which has nothing whatever to say to the question at issue. We have asked him to formulate a practicable means of testing the *bona fides* of provincial hospital teaching, and he suggests "that recognition shall be dependent on the students passing a defined clinical examination held before he enters on the succeeding year of study." If Dr. Laffan sees no objection to submitting a provincial student to an examination additional to those required from his city fellow-students, we agree that any hospital might be recognised with the guarantee of such additional test. But it is a question whether the colleges will think it worth while to hold such examinations for the benefit of the very few students who might elect to study in union hospitals under the penalty of an additional examination for so doing.

We wish it to be distinctly understood that we do not doubt the possibility of teaching a student in a union hospital much that he ought to learn, if the surgeon be active and well read ; but that all union surgeons do not fulfil these requirements may be judged from the following letter, received since our last, from a provincial surgeon :—

SIR,—I have been for some time rather in bewilderment about the meaning of various letters of Dr. Laffan, and a memorial by certain medical officers of workhouses in Ireland. On reading your article to-day it has dawned on me that all this means that somehow or other the Irish workhouse hospitals are to be connected with places of clinical instruction. Well, I can only speak of what I know ; and I do know one workhouse hospital which, as a rule, contains only worn-out old people in the last stage of incurable chronic disease. An occasional accident finds its way to it, and I have seen such a case in which primary amputation was performed, and the collapsed patient was placed after the operation on a small pallet of straw without sufficient covering and no artificial warmth. The result may easily be anticipated, "death by the first intention." The medical officer of this hospital does not possess a clinical thermometer and does not believe in its being of any use. When this medical officer resigns or dies his successor will be appointed simply according as Catholic or Protestant can command a majority at the board. How such a hospital with such a teacher can be connected with a school of clinical instruction I know not ; and if the Dublin hospitals are no better, as Dr. Laffan seems to intimate, I can only say "more's the pity."

Yours, &c.,
VERITAS.

We want to know how hospital teachers of this class are to be eliminated if Dr. Laffan's scheme of recognition is to come into effect ? A practical suggestion is much needed.

THE HEALTH OF DUBLIN.

For some time past we have refrained from recurring to the subject which last year occupied so much space in our columns because we thought it right that, after the publication of the joint report of the Colleges of Physicians and Surgeons upon the death-rate of Dublin, the Public Health Committee of the Corporation and its officers should be afforded an opportunity of doing

its duty before its proceedings were again submitted to criticism.

The Report for August issued by Dr. Cameron, the medical superintendent officer of health, affords us now a fitting opportunity to review the progress of the city towards something like tolerable salubrity, which has been manifest for the past six months. Dr. Cameron records for the month a death-rate of 18·8 per 1,000 and a zymotic mortality of 2·3 per 1,000, and he goes on to say—

"Since the registration of deaths has been even somewhat accurately carried out in Dublin, the state of public health has never been so satisfactory as during the past month. The following table shows the steady improvement which has taken place within the municipal or city districts of the metropolitan registration area since February last, 1881 :—

"Death-rate per 1,000 persons from all causes—

February	March	April	May	June	July	August
" 44·25	34·60	31·78	27·05	23·7	22·37	20·27

"Death-rate from seven principal zymotic diseases—

February	March	April	May	June	July	August
" 4·15	2·45	2·16	·2	1·96	2·1	2·62

"As compared with August, 1880, last month exhibits a most extraordinary contrast—

	August, 1880.	August, 1881.
"Death-rate from all causes per 1,000	39·27	20·27
"Ditto from 7 principal zymotics	10·33	2·62
"Admissions of zymotics to hospitals	158	88
"Deaths from zymotic diseases	227	57

"The remarkable improvement which has taken place in the state of public health in Dublin is, no doubt, in part due to the sanitary work performed during the last two years. Late in 1879 I commenced a more rigid inspection of the tenement dwellings than had previously been attempted. During the two years ended 31st August, 1881, orders were obtained from the magistrates to detenant and close 800 houses which were unfit for human habitation. During the same period there were permanently closed 242 cellar dwellings and about 150 rooms, which were placed under insanitary conditions. Nearly 2,000 water-closets were substituted for filthy privies ; and they were placed in the yards of the houses, and not within the latter. During the last year the cleansing of the streets, and more especially of the courts, lanes and alleys, has been carried out in a far more effectual manner than formerly, under the energetic and skilful superintendence of Mr. James Young.

"How far all this sanitary work has been instrumental in effecting the wonderful improvement which has taken place in the state of public health in Dublin, I am unable to say ; it is, however, noteworthy that the bills of mortality began to decline very soon after a greatly increased activity in our sanitary department."

It is a pleasure—an unwonted happiness—to be able to acknowledge a commendable increase in activity of the civic sanitary department and a concurrent—if not consequential—gain to sanitation. There has, indeed, been within the last half year a very substantial fall in the death-rate and an obvious improvement in the public health, and there has also been much work done which cannot fail to produce ultimately the best results upon the health of the city ; and, furthermore, there is a remarkable coincidence of data between the appoint-

ment of Dr. Cameron and the improvement which followed. We are glad to give that officer and the Public Health Committee full credit for these facts, but we cannot, until a sufficient time has elapsed to ensure that this improvement is not the result of an exceptional health-wave, venture to place the increased sanitary efficiency and diminished death-rate in the position of cause and effect.

We have, however, satisfied ourselves from an examination of the Registrar-General's returns that not only has the death-rate of Dublin improved steadily since February last, but that the improvement is greater than usually occurs in the lapse of the healthy summer months, and that, instead of retrograding as it was up to the beginning of 1881, the health of the city has made sensible change for the better.

This fact is very creditable to the recent efforts of Dr. Cameron and the Public Health Committee, but it also imposes upon them an increased responsibility to press forward the sanitary reform of the city. If a modicum of energy is capable of producing a golden harvest in the saving of life and the alleviation of pain and poverty, how much might we not expect if all that is obviously necessary and quite practicable were done? If the diminished death-rate means increased sanitary efficiency, does it not also mean that all is true that has been said of the effect of long years of neglect and dirt upon the health of the city? and does it not cry out for more activity and more exact system in working out the regeneration of Dublin in this respect?

The citizens thank the Public Health Committee for something done, and, by anticipation, for much more remaining to be done. We say to Dr. Cameron "*macte virtute.*"

Notes on Current Topics.

Requisition for Irish Poor-law Drug Supplies.

It is now a good many months since we pointed out fully the objections to and the redundancies of the form on to put which dispensary medical officers have been required in their requisitions for medicines; and we observe with much satisfaction that a new requisition form has been drawn up on the lines indicated by us in that article, and has just been issued. It is a great improvement on the old one. Antiquated and useless preparations have been cut off to such an extent, that though many new medicines have been added the number of drugs and their preparations has been reduced from 649 to 297, "coated pills" have been given as an alternative to pills "in mass." This is an immense boon to those medical officers who have had to attempt pill-making out of the mouldy "masses" in their dispensary lockers.

A very important paragraph has been introduced into the preface of the new form as follows: "In the event of any medical officer requiring to be supplied with any medicine not comprised in the list, a distinct requisition for such medicine should be made by the medical officer, through the committee of management, stating the circumstances which are considered to render the requisition

necessary." The right of the medical officers to have any medicine he requires is thus distinctly recognised.

We hail with satisfaction the indication which this improvement in the method of the supply of drugs to Irish unions presents, that the attention of the Irish Local Government Board is, at length, earnestly directed to the gross abuses of the contract system, and the scarcely veiled roguery which has been the characteristic of this trade for years past. The new form of requisition is excellent, and it will save the medical officers much trouble and perplexity in the ordering of their supplies, but it will not help in the least degree to make the drugs supplied on the authority of the requisition honest in price or quality, or at all effective as therapeutic agents. It is notorious that the Irish contract drug system is the *nidus* of illimitable trade roguery, that the ratepayers are cheated, the paupers deprived of proper medical treatment, and the physician discredited and annoyed, and we earnestly trust that the Irish Local Government Board will follow up the amendment of its requisition form by taking some steps to put a stop to the infamous system of Poor-law drug contracting. They have done something by authorising the use of "coated" pills, and we do not doubt that medical officers will at once avail themselves of the authority to obtain a stock of reliable medicine made up in such form as is suitable for dispensary work. We fully believe that the "coated" pills will prove to be much cheaper in the long run, and there can be no doubt that, compared with the rubbish supplied to unions under the drug contract system, they will be found effective, satisfactory, and most convenient.

Committal of Pauper Lunatics in Ireland.

We claim the attention of our readers to the communication published by Dr. Oscar Woods in the Lunacy Department of our present issue. The objectionable nature of the existing system for the admission of pauper lunatics to district asylums in Ireland, and the ill-effects of that system upon the lunatics themselves, and upon the public service have been repeatedly referred to by us, the objections which we have raised are forcibly illustrated and explained by Dr. Woods, whose experience of the system gives authority and force to his observations. We hope that one of the earliest measures of the next Parliament will be a Bill to remedy the existing condition of things.

A Warning to Coroners.

A SERGEANT of the Somersetshire militia recently died at Taunton under the following circumstances after only a few hours' illness:—The medical gentleman who saw him was unable to certify as to the cause of death. At the inquest a verdict of "Died by the visitation of God" was returned, but subsequently a post-mortem examination of the body was made, when a quantity of arsenic, more than sufficient to cause death, was found in deceased's stomach, though whether taken voluntarily or administered by some one is as yet unknown. The matter was placed in the hands of the police, and at the beginning of July the Court of Queen's Bench, on the application of the Attorney-General, quashed the inquisition, issued a *mandamus* commanding the coroner of the district to have the body disinterred and to hold another inquiry.

Scarcity of Dwellings for the Poor in Dublin.

In his last report to the Corporation, the Medical Superintendent Officer of Health for Dublin says, that the closing of many dwellings has caused a great dearth of homes for the very poor; they complain that they find it difficult to procure tenements, and also that the rents of the lowest class of tenements has lately been raised. If the Corporation continue closing up tenemental dwellings at the rate which has prevailed during the present year he fears it will be almost impossible for the labouring classes to procure lodgings, and trusts that the Corporation may soon be in a position to erect some dwellings under the Labouring Classes' Dwellings Act, so as to provide a remedy for the only evil which has arisen out of the closing of so many tenemental dwellings—namely, the want of cheap houses for the poorest classes of the population.

Sanitary Statistics of Jews.

At the close of an article in the *Revue Scientifique*, May 14, writer says:—

We believe that we have been able to show that nearly everywhere the Jews enjoy the following physiological immunities, when compared with the inhabitants of the countries in which they are established:—1. Their general fecundity (the relation of births to population) is less. 2. According to locality, their marriages are more or less fertile, but everywhere they preserve a larger number of their children. 3. They have much fewer illegitimate births and infants born dead. 4. The proportion of male births is sensibly higher. 5. Their mortality is less, and their mean life is longer. 6. Their increase, by the preponderance of births over deaths, is more rapid. 7. If they do not completely escape contagious diseases, they are less severely affected by them. 8. They are protected from certain diseases, such as pulmonary phthisis and scrofula. 9. They become acclimated and reproductive under every latitude.

These immunities resist the generally miserable condition which all observers attribute to them, as they do the frequency of their consanguineous marriages and their sojourn in cities, remote from the salutary influences of rural life enjoyed by the majority of the other inhabitants. What can be the causes of these privileges? Must we regard them, with a large number of authors, as the result of a superior vitality inherent to the race, which has been preserved intact through ages, and in spite of the differences of climates, in consequence of an almost complete absence of crossing? Must we seek these only in the persevering observation of the laws of hygiene laid down in Deuteronomy? But these rules were only applicable to the climate under which the ancient Israelites lived, whether in Judæa or in Egypt during the captivity. Or should we attribute them, first, to the salutary influence of marriage, which Jews contract at a less advanced age than Christians, and also to their following the less fatiguing occupations, and which are but little exposed to accidents? Can we admit, also, that they profit by the beneficial hygienic effects of the spirit of order and economy, of regulation in habits and moderation in tastes in the relative severity of their manners and the completely private and family life which many observers

attribute to them? Finally, are we to admit with others that their state of misery is only in appearance, and that in reality, their well-being is generally superior to that of the population amidst which they live? All these hypotheses are admissible.

A Creditable Representative of the Profession.

At the Whitby Police Court last week a "doctor of medicine" was charged with sleeping out, not having any visible means of subsistence, and not being able to give a good account of himself. A constable stated that he found the defendant in a coal-shed. He spent all the money he got in drink, and was leading a thoroughly vagrant life, making no effort to retrieve his character. Defendant pleaded guilty to the charge, and made a pathetic appeal to the bench not to send him to prison. He had been to prison once, he said, and if he was sent again it would mean absolute ruin to him in his profession. The bench replied that he must go to prison for fourteen days.

Glass Blowers and their Diseases.

DR. DIFFERNER, of Belgium, offers in the *Gazette Medicale de Paris* a paper on this subject. From a residence among factories for glass blowing, he has had special advantages for studying the results of this kind of labour upon the different organs of the body.

The temperature around the furnaces is a very high one for the melting of glass, and the pulmonary effort for ten or twelve consecutive hours is very great. Added to these causes of disease is the too common and improper use of alcohol. On the other hand, the wages of the labourer are higher than in other occupations, and his home and surroundings better. But these advantages are badly made use of. The love of money conduces to unusual prolonged labour, which added to the excess of alcohol, soon breaks down the strongest constitution which yields to the first attack of disease. They seldom re-act, and the first affections pass easily into chronic and adynamic conditions. The digestive organs suffer severely. There are ulcerations of the lips, of the tongue, of the palate, without being very severe, chronic catarrhs of the stomach and intestines, with violent dyspepsias. These are due to irregularity of eating and drinking, and particularly the latter.

Ovariectomy of Milk Cows.

In a paper on milk, published in the *New York Medical Record*, Dr. Brush recommends the removal of the ovaries from milk cows by the operation known as spaying. If this operation, says he were more generally adopted by the owners of dairy cows, we would avoid many of the influences which affect the value of milk. If, after a cow has calved, and the flow of milk has attained its normal condition, this operation were performed, we would avoid those conditions in the cow which have a deleterious effect on the milk, such as the recurrence of the sexual desire, pregnancy, and the like. A cow once spayed will continue to give milk during the remainder of her life.

Nitrite of Amyl in Affections of the Ear.

DR. JULES MICHAEL, of Hambourg, reports in the *Annales des Malades de l'Oreille* that in a great number of maladies of the ear, the subjective noises (or ringing of the ears) which constitute a grave symptom and serious consequences, a suitable treatment can often dispel the symptom. What constitutes a grave affection is a severe catarrh of the middle ear, producing a discharge, and here remedies often fail. The narcotics, revulsives, galvanism, fail entirely. Dr. Michael originated the ideal of trying nitrite of amyl. This anæsthetic acts by paralyzing the vaso-motor nerves. Being tried in twenty-seven cases it produced amelioration in nineteen of them. In three cases the ringing completely ceased. In four cases there was a sensible improvement. The greater part of the cases were otitis from hypertrophy of the middle ear.

Five drops of the nitrite of amyl were inhaled at one sitting. By prolonging the inhalation the symptoms were redness of face, eyes brilliant with injection of the blood vessels; approaching vertigo the inhalation was stopped.

The duration of amelioration after one sitting has been very diverse. Sometimes only one hour, with other two weeks, and one case three months. The second inhalation has the most durable effect.

How to Give Tannin.

THIS useful astringent often yields unsatisfactory results when administered in powder or simple solution, either failing of effect or producing pain and other signs of irritation of the stomach or intestines. We note in a German exchange, that at the Leipzig Policlinik all these unpleasant results are avoided, and a very useful and agreeable astringent mixture, well suited to children, is prepared by forming an albuminate of tannin, according to the following formula:—*R.* Acidi tannici, two parts; aquæ; sol. album. ovi. un., ää 100 parts. The last-mentioned is to be added with stirring briskly.

Antiseptic Ovariectomy.

PROFESSOR C. J. ASK, of Lund, in Sweden, contributes to the recently published number of the *Nordiskt Mediciniskt Arkiv* a paper on Ovariectomy. He had had thirty cases, of which seven were operated on without antiseptics, before July, 1877; in the remaining twenty-three cases antiseptic measures were adopted. Of the seven cases in the first group two died; while in the twenty-three antiseptic cases there were only three deaths. In the last twelve cases Dr. Ask has not had one death.

The Inner Circle Railway.

ON Monday, the 5th inst., an important and interesting ceremony, likely to have a considerable influence on the future of London, took place in a yard near Aldgate. This was nothing less than the formal commencement of the works in connection with the completion of the Inner Circle Railway, whereby the gap intervening between Mansion House and Aldgate Stations will cease to exist as a break in the line of railway communication. The Lord Mayor, who dug the "first sod," made general reference to the results likely to follow from his perform-

ance, but in the congratulatory addresses that were delivered, there was no mention made of the very considerable advantages we may reasonably anticipate will follow from increased facilities for locomotion afforded to those who make use of two large hospitals, whether as applicants for, or dispensers of, medical relief. Any better means of approaching the London Hospital than are now to be found cannot fail to bring the immense advantages it offers for surgical and medical studies within reach of an increased number of students; and, we may not unreasonably hope that no distant date will witness direct communication between Aldgate and Whitechapel Stations established. Guy's Hospital, too, will be nearer than it is—in point of time—with a point of access to which in a brief period West-enders can be transported. It is much to be feared, however, that nothing will now avail to restore the popularity of this once noble school. That the completed railway will help on the progress of medical science as well as that of commerce is a gratifying reflection in spite of the evident domination of its projectors' minds, by the principle suggestive of the *auri sacra fames*.

Paraguay Tea.

THE action of maté or Paraguay tea upon the blood has been investigated by MM. D'Arsonval and Couty (*Comptes Rendus*, July 11). Absorbed by the stomach or the veins, maté diminishes the oxygen and carbonic acid of arterial and venous blood enormously, sometimes to a third or a half of the normal quantity.

The Dangers of Schools.

THE frequency with which injury and even death are caused by rash punishment inflicted on young children by school teachers, has again and again formed subject of outspoken denunciation on the part of those who are able to estimate the severity of the damage thus frequently produced. And yet, in spite of numerous warnings uttered from the bench and by the press, we find more than occasional records of brutal ill-treatment of children at the hands of their teachers. So serious are many of these cases that it is fast becoming an imperative necessity to put some effectual check on the license which schoolmasters at present enjoy and indulge. The employment of rulers as instruments of punishment cannot be sufficiently condemned, and absolutely no defence can be urged in favour of striking the head, or indeed any part of the body but the buttock with even the legitimate cane. If corporeal punishment is a necessity it ought to be administered in such a way as to insure no after ill effects to the pupil, and in no case should it be permitted to an under-master. If discipline is to be maintained in schools through the fear inspired by the rod, then it should be a criminal offence for any but the chief authority to punish. As a matter of fact, complaints of ill-treatment come chiefly from sufferers at the hands of assistant masters; or where this is not so, it usually happens that the offender is either an ill-paid, ill-educated, and ill-principled board or British school teacher; or he is a man of ungovernable temper, although possibly of superior social status. Such persons will always be found among eachers, and so long as they are not brought

under the fear of legal consequences, they will persist in indiscriminate punishment of their unpromising pupils. Only last week a teacher at Bradford was committed for trial on a charge of manslaughter, a female pupil twelve years of age, having been so severely beaten on the head and hands with a ruler by him, that she died in consequence. We repeat that the cases of irreparable injury received in schools are beyond number, and that it should be made a criminal offence to inflict any punishment that may possibly be followed by serious injury to the person of the student.

American Degrees.

THE fast growing dubiousness with which even the best American degrees are being regarded in this country, renders it a matter for general congratulation that a movement in the right direction with respect to the innumerable bogus diplomasis being made. The American Association for the Advancement of Science, during its recent meeting at Cincinnati, took action in the matter by deciding to unite with the American Philological Association in memorialising all United States colleges empowered to grant the degree of Ph.D., and urging them not to confer it *honoris causa*. It seems that as much mischief of a certain kind is done by the spurious M.P.'s (Masters of Penmanship), D.D.'s, D.Sc.s, &c., as by the miserable shams who impose a purchased American M.D. in place of a registrable British qualification, on the English public. The *Times*, in commenting on this subject, suggests that "it would certainly be difficult in a country like the United States to secure uniformity in practice in this matter among all the 360 colleges; for the sake of the respectable institutions it is a pity that it cannot be secured. We trust, however, that the action of the American Association will have some influence with the peccant colleges; it will, at any rate, put people on their guard against American Ph.D.'s and S.D.'s, as well as D.D.'s.

Librarian's Congress.

DURING the present week the Library Association of the United Kingdom will hold its annual conference in London, the days of meeting being September 13, 14, 15. The sessional proceedings will take place in the hall of Gray's Inn, and several papers bearing on library matters and arrangements will be read and discussed. There is a good deal of useful work that we hope to see accomplished by-and-bye through the aid of the Library Association, in connection with the classification and arrangement of medical libraries. The Association will dine together on Thursday evening at the Freemason's Tavern, the country members being invited to this entertainment by their Metropolitan brethren; and in addition to visits of inspection arranged to be paid to several interesting collections of books, the Inns of Court Libraries especially, several private and other parties will be held to welcome the members of the Association.

THE will of Mr. Thomas Heckstall Smith, late of St. Mary Cray, Kent, was proved last week in the Probate Court under a personality of £62,000.

New Medical Knights.

THE Queen has been graciously pleased to approve of the honour of knighthood being conferred upon Mr. G. C. M. Birdwood, M.D., C.S.I., of the India Office, late Bombay Medical staff; and John Kirk, Esq., M.D., C.M.G., agent and consul at Zanzibar.

American Ophthalmological Society.

AT the last annual meeting, held in Newport, Rhode Island, July 27th and 28th, 1881, the following gentlemen were elected officers for the ensuing year:—President: Dr. H. D. Noyes, of New York; Vice-President: Dr. William F. Norris, of Philadelphia; Secretary and Treasurer: Dr. Richard H. Derby, of New York; Corresponding Secretary: Dr. J. S. Prout, of Brooklyn; Committee on Publication: Drs. E. G. Loring, D. B. St. John Roosa, and Richard H. Derby.

Drink and Lying.

DR. RICHARDSON, in an article contributed by him to the *Church of England Temperance Chronicle*, draws attention to the agreement among medical men as to the universal habit of lying among dipsomaniacs. "Alcohol," he asserts, "produces, when taken into the body in large quantities, nervous aberration," by which, he continues, he means, "that a part of the diseased constitution produced by the repeated action of alcohol in the body is indicated by that loss of appreciation between the true and the untrue, which we call the habit of falsehood." In the same current number of the periodical, Dr. N. Kerr, has an article on "Improvvidence in Alcohol."

Intense Heat in America.

THE Americans seem to be experiencing to an unpleasant degree that summer heat which has been conspicuously absent in this country during the present year; and judging from the accounts to hand we may with some reason congratulate ourselves on the immunity we have hitherto enjoyed. In some places in America there is grave cause for apprehending future epidemics in consequence of the exposure of large numbers of unburied carcasses of cattle, which there are too few people to bury. The huge fires that have raged in Michigan have been a chief cause of the devastation of crops and cattle, and the consequence likely to ensue from the continuance of decomposing material above ground will need to be keenly provided against if the least possible evil is to result from them. The atmospheric peculiarities accompanying the great heat are interesting evidences of its intensity, and we may expect to hear of a long train of nervous and other diseases incident to the occurrences characterising the heat.

THE mortality in the principal foreign cities the rates of according to the latest official weekly return, were in—Calcutta 25, Bombay 33, Madras 40; Paris 26; Brussels 23; Amsterdam 19, Rotterdam 20, The Hague 30; Copenhagen 19, Stockholm 22, Christiana 14; St. Petersburg 42; Berlin 35, Hamburg 24, Dresden 30, Breslau 43, Munich 38; Vienna 24; Prague 30; Buda-Pesth 40; Turin 22; New York 36, Brooklyn 29, Philadelphia 27, and Baltimore 32 per 1,000 of the populations.

A FIRE which might have been attended with alarming consequences, but for the promptness displayed, broke out in the laundry of the Homerton Fever Hospital last Thursday.

THE Lord Chancellor, on the recommendation of the Marquis of Donegal, the Lieutenant of the county, has appointed Dr. M'Donnell, of Randalstown, on the Commission of the Peace for county Antrim.

THE annual rates of mortality last week in the principal large towns of the United Kingdom per 1,000 of the population were—Brighton 13, Portsmouth 13, Norwich 13, Birmingham 14, Bradford 14, Oldham 15, Plymouth 15, Dublin 16, London 16, Leeds 17, Newcastle-on-Tyne 17, Wolverhampton 17, Salford 18, Bristol 18, Edinburgh 18, Manchester 19, Nottingham 19, Sheffield 20, Glasgow 21, Liverpool 22, Sunderland 22, Hull 24, and Leicester 25.

FROM diseases of the zymotic class scarlet fever showed the largest proportional fatality in Hull, Leicester, Nottingham and Sunderland; the deaths from this disease in Hull, which had been 23 and 29 in the two preceding weeks, declined to 16 last week. The 26 deaths from diphtheria in the large towns included 8 in London, 5 in Glasgow, 3 in Portsmouth, 3 in Birmingham, and 3 in Manchester. Fever, principally enteric, showed the highest death-rate in Nottingham, Newcastle-on-Tyne, and Salford. Diarrhoea fatality showed a further general decline, and was considerably below the average for the season. Small-pox caused 24 more deaths in London and its outer ring of suburban districts, and not one in any of the other large towns.

Scotland.

(FROM OUR NORTHERN CORRESPONDENT.)

THE UNIVERSITY OF EDINBURGH.—OPENING OF NEW BUILDINGS.—During the forthcoming Session, the classes of surgery, midwifery and anatomy, are to be transferred to the class rooms of the new buildings. It is to be hoped that the acoustic arrangements will be better than in the old, for it is too much to expect students to sit through several hundred hours with their necks on the stretch, and their left hands up to their ears to catch the feeble accents of the lecturer. In the smaller class rooms, only those on the front benches could hear, and if it were not for the "written word" of the professors, the student might have gathered as little information as at a quaker's meeting. What the case will be in the new it is difficult to say, but surely the Senatus might suggest the necessity for speaking up, or of graceful retirement when such retirement can be made amid sweet memories and grateful acknowledgements for much good and sound teaching. In another University we hear that the students have given up all attempt to obtain information, and seek calm repose on the benches induced by the mild hum in the well of the theatre, or wile away the tedious hours by reading the newspaper.

ABROATH SMALL-POX EPIDEMIC.—The epidemic of small-pox, which broke out about two months ago, is now all but extinct. Two convalescent cases alone remain in the hos-

pital. Only two deaths have occurred during the epidemic, one on board the ship where the disease broke out, and the other, a young man belonging to the town.

LEITH—PUBLIC HEALTH RETURNS.—From the returns prepared by the Leith registrars, it appears that during the month ending 3rd September 88 deaths occurred in the burgh. There were 198 births, of which 12 were illegitimate. In a note, Mr. Gilbert Archer, officer of health, states that 88 deaths during the month, as against 125 in the corresponding month of last year, shows an unusually low rate of mortality, being equal to 17 per 1,000. Indeed, it may be noted, as almost without precedent, that in North Leith only one death was registered during the fortnight ending 27th August. Typhus fever has almost disappeared, but scarlet fever still lingers in a few localities. This low death-rate, with the presence of typhus and scarlet fever, which have been more or less epidemic in Leith, is a corroboration of the statement repeatedly made by sanitarians that the death-rate is no index of the healthiness or unhealthiness of a district.

REGISTRAR-GENERAL'S REPORT.—The death-rate in the eight principal towns during the week ending with Saturday, the 3rd September, 1881, was 18·9 per 1,000 of estimated population. This rate is 0·4 below that of the corresponding week of last year, but 1·5 above that of the previous week of the present year. The lowest mortality was recorded in Leith viz., 12·7 per 1,000; and the highest in Paisley—viz., 23·3 per 1,000. The mortality from the seven most familiar zymotic diseases was at the rate of 3·4 per 1,000, or 0·2 above the rate for last week. Acute diseases of the chest caused 70 deaths, or 18 more than the number registered last week. The mean temperature was 51·3, being 1·1 below that of the week immediately preceding, and 10·8 below that of the corresponding week of 1880.

ABERDEEN—WATER CASE.—In the Aberdeen Small-Debt Court last week, Sheriff Comrie Thomson gave decree against a butcher residing at Old Aberdeen, for 10s., with expenses, for having, during the past two years, used water from the public well for purposes other than domestic. The pursuers were the Police Commissioners of the burgh, and the water used was for a horse, the expense of which the Commissioners estimated at the rate of 5s. a year.

Obituary.

RICHARD OLEWIN GRIFFITH, M.R.C.S.

WITHIN three days of each other two of the oldest and most venerated members of our profession have passed away from amongst us, Dr. Archibald Billing, F.R.S., the Author of the "First Principles of Medicine," who died on the 3rd inst., in his 91st year, and whose obituary we gave in our last issue, and Mr. Richard Olewin Griffith, M.R.C.S., M.S.A., F.S.A., &c., who died on the 5th inst., at 20 Gower Street, at the age of 90, having been born in the neighbourhood in which he died in the year 1791. Mr. Griffith's father was an apothecary in or near Tottenham Court Road, where he bred and brought up a large family. Richard, his second son, he determined upon educating for the medical profession, and in due course, and at an early age, "he walked the hospitals" of St. Thomas's and Guy's. He became a member of the Apothecaries' Society in 1812, and a member of the College in 1813; consequently, he was an older member of the profession than Dr. Billing. Young Griffith determined to see practice, and with this view he quickly sought and obtained an assistant-surgery in the army (which at that time was in want of assistants), and he proceeded to join Wellington's staff on the field of Waterloo. Having seen some service, he returned home, and settled

down to the humdrum life of general practice. He soon succeeded in obtaining the largest and best practice in the neighbourhood, and he more than once told the writer of this notice that, for thirty or more years, and the greater part of each year, he was in the habit of seeing and prescribing for eighty, ninety, and a hundred patients a day, frequently employing two and three assistants in dispensing the medicines. He enjoyed remarkable health, but although one of the best informed men in the practice of his profession, he never had a sufficient amount of spare time to give the results of his great practical experience to the profession; so that he is not known to have contributed anything to the general stock of knowledge. When quite late in life he retired from practice, and became a member of almost all the learned societies in London, he was content to remain a listener and a learner rather than a guide and a teacher. In due course he became Master of the Apothecaries' Society, an office he filled with the greatest satisfaction to the Court. As a man of most sociable and genial habits of life, he commanded a wide circle of friends, with whom he remained on the closest terms of intimacy up to the day of his death. He leaves behind him a son, a well-known and highly respected member of the profession, another having pre-deceased him by some four or five years, several daughters, and very numerous grandchildren.

Correspondence.

SUPPLY OF MEDICAL SPECIALITIES TO DISPENSARIES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR.—I have on more than one occasion pointed out that it is in the power of medical officers of dispensary districts to obtain good medicines for their dispensaries instead of the wretched stuff that is often supplied by contract, if they require all-important medicines to be supplied with the name and trade mark of a respectable maker on it.

The plan I have adopted is to select all the active medicines I want from the list of specialities of a well-known English pharmaceutical house, especially from their list of coated pills. As I had no meeting of my committee for some months I sent a requisition for a supply of such medicines direct to the board of guardians. They did not like to take the responsibility of sanctioning the order so they sent it up to the Local Government Board, who replied as follows:—

"I am to state that any medicines required by the medical officer which are not included in the prescribed list should be applied for by distinct requisition, stating the circumstances which are considered to render the requisition necessary. A revised list of medicines will shortly be issued."

In reply to this I sent the board of guardians the following "reasons," which were forwarded to the Local Government Board:—

"Parsonstown, 19th August, 1881.

"TO THE CLERK OF THE PARSONSTOWN UNION.

"Sir,—In compliance with the directions given by the Local Government Board in their communication to you of the 18th inst., I beg to give the following reasons for requiring the medicines which are not in 'the prescribed list':—

"1. From what I know of the state of the drug trade I consider it essential as a guarantee of the genuineness of every important medicine that it should be supplied by a manufacturer of known reputation. I have therefore required in several cases that drugs which are in the list shall be supplied in a concentrated form, with the name and trade mark on the bottles of a maker of known reputation.

"2. I have ordered several medicines which have come into general use since the 'prescribed list' was formed. There seems to be no reason why the poor should be without these medicines till the Local Government Board has prepared a revised list. The more so, it is some months

since they intimated that such a list was in progress, and it is still only 'shortly to be issued.'

"3. I have ordered a supply of 'pearl-coated pills' as they are not injured by damp.

"4. The ultimate cost of the medicines I have ordered is not more than if I ordered a quantity of extracts and pill masses such as are in the 'prescribed list,' which would be spoiled in a few weeks, whereas I have ordered them in a form in which they will keep for years.

"Yours, &c.,

"A. WALLACE, M.D."

A reply was at once sent down directing that my dispensary should be supplied with these drugs.

I consider this an important point gained, as the "reasons" I have assigned apply all over Ireland, and the action of the Local Government Board in the matter clearly recognises the right of the medical officer to be supplied with drugs in which he has perfect confidence.

I trust medical officers generally will at the same time exercise a wise discretion by using economy, as can very well be done when the drugs are made up in such form for administration as that there need be no waste.

Yours, &c.,

A. WALLACE, M.D.

Parsonstown, 25th August, 1881.

NOTICES TO CORRESPONDENTS.

ALL CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 25 strings for holding each volume of the *Medical Press and Circular*, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat after it has passed through the post.

LOCAL REPORTS AND NEWS.—Correspondents desirous of drawing attention to these, are requested kindly to mark the newspapers when sending them to the Editor.

A PUZZLED ONE.—We have read the evidence of Dr. Norman Kerr and Prof. Wanklyn, and cannot, with the most charitable construction, make them coincide. The best that can be said on the subject is that there is a mistake somewhere, on which side we are not prepared to decide.

MR. TUSON.—The terms are synonymous, the first is the more generally used, the other is almost obsolete.

A PROVINCIAL PRACTITIONER.—"Better endure the ills ye have than fly to those ye know not of" is, unfortunately, applicable in your case. Boards of guardians are never over tender in their mercies towards their medical officers, whom they know to be their superiors, although legally their servants. The action of a neighbouring practitioner is little better than despicable.

DR. E. W. B.—Satisfactory in every way.

MR. SUTTON.—No, much below the average of recent years.

DR. PEARSON is thanked for the paper which we have read with much interest.

THE PARKES MUSEUM OF HYGIENE.—We are asked to announce that this Museum will be re-opened next month. Tuesdays, Thursdays, and Saturdays will be free days. Lectures on Sanitary Science will be given during the ensuing season.

CYCLOPE.—It often enough requires the use of both eyes on our part to detect a attempt like those you draw attention to. By a reference to the number for July 18th you will see that we were even then aware of what was about to happen, and had prepared to foil the endeavour. We shall succeed in doing so.

DR. EDWARDS.—We have already said all we intend saying on the subject. There is nothing to hinder you from repeating the notice, in fact, we think you had better.

THE POTENCY OF VACCINE LYMPH IN TUBES.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR.—How long does vaccine-lymph in tubes retain its power of propagating vaccinia?

Yours, &c.,

A HACK.

["* This query does not admit of any very definite reply. The safe rule is that vaccine-lymph in tubes should be used as quickly as possible.—ED.]

MR. W. A. OLIVER.—By the announcement on our title-page you will observe that our annual "Students' Number" will be issued next Wednesday.

A NOVEL USE OF A VACCINATION CERTIFICATE.—Last week in the

City of London Court a young man was sued for payment of goods supplied, when he set up the extraordinary defence of infancy, and produced a certificate of recent vaccination in proof. He was, nevertheless, convicted in spite of his plea, much to his annoyance and apparent surprise.

MR. F. SHERLOCK will find his communication referred to in another column.

DR. J. M.—A review of your book is in type and will appear in an early number.

DR. SLEVIN.—The address of the author of "Sanitary Conditions of Turkey" is 29 Euston Square, London, W.

PILGRIMAGES AND DISEASE.—The purity of holy wells has probably never borne a satisfactory relation to their sanctity. It must be hoped, however, that not many are in such a state as that of the well of Zemzem at Mecca, which is deemed so sacred that large quantities of its waters are regularly exported to be drunk by the Moslem faithful in all parts of the world. Prof. Frankland has analysed this precious fluid, and finds it "sewage, more than seven times as concentrated as London sewage." After this nobody will wonder that pilgrimages to Mecca are often attended by outbreaks of cholera.

PHARMACEUTICAL SOCIETY OF GREAT BRITAIN.—The next evening meeting of the above Society will be held on Wednesday, October 6th, at 8 o'clock. The seasonal prizes and certificates will be distributed at this meeting. An address to the students will be delivered by Charles Symes, Ph.D. All students and friends, are invited to be present.

MIDDLEMORE FUND PRIZE ESSAY.

WE are asked to announce that the interest on the fund of £500 given in trust to the British Medical Association by Mr. Richard Middlemore, of Birmingham, to found a prize for the best essay on Ophthalmology, having accumulated for three years, the Committee of Council now offer, in accordance with the terms of the trust deed, a prize of £50 for the best essay on the Scientific and Practical Value of Improvements in Ophthalmological Medicine and Surgery made or published during the past three years. The successful essay will be the property of the Association. Essays must be in English or accompanied by an English translation, and forwarded under cover, with a sealed envelope bearing the motto of the essay, and containing the name and address of the author, addressed to the General Secretary of the British Medical Association, 161A Strand, London, and must be in his hands on or before May 31st, 1882.

A MODEST ESTIMATE.—The Editor of the *Alliance News*, the leading organ of the temperance advocates, has, after very carefully prepared statistics, come to the conclusion that the nation loses annually the moderate sum of two hundred and twenty millions sterling from the drinking habits of the people: which may be summarised thus:—

Loss of time and labour	£50,000,000
Destruction of property from fire, &c, theft, bankruptcy, "and otherwise" .. .	5,000,000
Cost of sickness, insanity, biliousness, and premature death	20,000,000
Loss from idleness of this pauper, criminal vagrant, and lunatic	18,000,000
Loss from non-production of capital spent in drink	20,000,000
Cost of judge, magistrate, lawyers, witnesses, policemen, jurymen, jailor, hangman	5,000,000
Loss arising through the extra cost of religious, moral, temperance, and other social efforts and expenses needed to counteract the evils of intemperance	10,000,000
Adding the cost of "intoxicating liquors" consumed by the typical drinker, say ..	82,000,000
Total	£220,000,000

In this estimate we expected to find an item of a few odd millions spent on doctors, but the Editor would appear to regard it as inevitable that the drunkard kills himself without the intervention of medical men, for which opinion we ought to be grateful.

THE LATE SURGEON LONDON.

To the Editor of the *MEDICAL PRESS AND CIRCULAR*.
St. Bartholomew's Hospital, E.C.,
Sept. 1881.

SIR,—It has been suggested that a Memorial Brass should be placed in the Hospital Church of St. Bartholomew-the-Less to Arthur Jermyn London, our late friend and fellow-student, who fell in the discharge of his duty at Majuba Hill, in the Transvaal, on Sunday, February 27th, of this year.

The circumstances of Mr. Landon's death are given (at foot) in the proposed inscription, to defray the cost of which we invite the subscriptions of colleagues and other members of the profession.

In no case do we anticipate that the amount required from each subscriber will be more than half a guinea, and if many respond it might be less.

Names and subscriptions may be sent to any of the undersigned:—
C. E. Harrison, M.B., Surgeon, Grenadier Guards Club, 70 Pall Mall, S.W.; Joseph Mills, The College, St. Bartholomew's Hospital, E.C.; Norman Moore, M.D., The College, St. Bartholomew's Hospital, E.C.; W. E. Stevenson, M.B., Hospital for Sick Children, Great Ormond Street, W.C.

His former medical contemporaries at St. Bartholomew's Hospital have set up this tablet to keep in memory the bright example of Arthur Jermyn London, who, while continuing to dress the wounded amid a shower of balls in the action on Majuba Hill, was in turn mortally wounded by a bullet, and calling out to his assistants, "I am dying; do what you can for the wounded," only desired for himself that his friends might be told that "he fell doing his duty." His habitual life was expressed in the simple grandeur of his death.

Vacancies.

- Bath General Hospital.—Resident Medical Officer. Salary, £100, with board. Applications (under cover to the Committee) to be addressed to the Registrar before Sept. 22.
- Birmingham Children's Hospital.—Assistant Resident Medical Officer. Salary, £40, with board, &c. Applications to the Hon. Sec. before Sept. 20.
- Cheltenham General Hospital.—Dispenser. Salary, £26, with board. Applications to the Hon. Sec., Board Room, before Sept. 24.
- Manchester, Owens College.—Demonstratorship of Anatomy. Salary, £128. Applications to be addressed to the Senate before Sept. 23.
- Oughterard Union, Lettermore Dispensary.—Medical Officer. Salary, £100, and £12 as Medical Officer of Health. Election, Sept. 27.
- West Bromwich Hospital.—House Surgeon. Salary, £20, with board. Applications to W. Bache, Esq., West Bromwich, before Sept. 28.

Appointments.

- ASHWELL, H. G., M.R.C.S., House Surgeon to Guy's Hospital.
- CREWE, W. T., F.R.C.S. Eng., L.R.C.P. Lond., House Surgeon to Guy's Hospital.
- FRASER, F., M.B., C.M., L.R.C.P. Ed., L.R.C.S. Ed., Medical Officer to the Fifth District of the Severn-Soaks Union.
- HATTON, G. S., M.B. Dur., M.R.C.S., House Physician to the North Staffordshire Infirmary.
- LEACH, J. C., M.D., B.Sc., S.Sc.C. Camb., County Analyst, has been appointed Analyst for the Borough of Shaftesbury.
- LLOYD, E. W., M.R.C.S., House Surgeon to the West London Hospital, Hammersmith.
- M'NEILL, J. P., M.D.T.C.D., L.R.C.S.I., Public Analyst for the Borough of Tiverton.
- MACDONALD, J. A., M.R.C.S., Medical Officer for the Berwick District of the Berwick Union.
- MARLOW, F., M.R.C.S., L.S.A. Lond., House Surgeon to St. Thomas's Hospital.
- MURRAY, —, M.B. Dub., M.R.C.S., Medical Officer for the First District of the Pembroke Union.
- NEWHAM, W. H. C., M.R.C.S., B.A. Cantab., House Physician to Guy's Hospital.
- PAGE, F. M., L.R.C.P. Ed., L.R.C.S. Ed., Medical Officer for the Bilton District of the Keynsham Union.
- POWELL, G. B., L.R.C.P. Ed., L.R.C.S. Ed., Medical Officer for the Third District of the Nottingham Union.
- PRYNN, W. W., M.R.C.S., House Surgeon to Guy's Hospital.
- REDMOND, I., L.R.C.S.I., L.S.A. Lond., Honorary Surgeon to the Stockton Hospital, Stockton-on-Tees.
- RHEE, J., M.R.C.S., Assistant Surgeon to the City Provident Dispensary and Surgical Appliance Association, London, E.C.
- SAVILL, T. D., M.R.C.S., L.S.A. Lond., House Physician to St. Thomas's Hospital.

Births.

- DINGLE.—Sept. 6, at 61 Bunhill Row, Finsbury, E.C., the wife of W. A. Dingle, M.R.C.S., of a son.
- FAIRBANK.—Sept. 5, at Windsor, the wife of Wm. Fairbank, M.R.C.S., of a daughter.
- HEDERMAN.—Sept. 3, at Rathkeale House, Rathkeale, the wife of William Hederman, L.R.C.P. Ed., of a son.
- NASH.—Sept. 5, at Herne Bay, the wife of E. Nash, M.D., of Lansdowne Road, Notting Hill, W., of a daughter.
- WADE.—Sept. 8, at 3 Wrington Villas, Forest Hill, S.E., the wife of C. H. Wade, B.A. Oxon, F.L.S., of a daughter, prematurely.

Marriages.

- BIRTWHISTLE—HEWETSON.—Sept. 7, at All Saints', Scarborough, Dr. F. Birtwhistle, of Barton-on-Humber, to Julia, second daughter of Hy. Hewetson, Esq., of Falgrave, Scarborough.
- JOHNSTON—PERCEVAL.—Aug. 31, at Kilkeel Church, Dr. Percy Herbert Johnston, A.M.D., eldest son of Dr. J. W. Johnston, Park View, Cork, to Agnes Maude, eldest daughter of General J. Maxwell Perceval, O.B.
- REDMOND—QUINLAN.—Sept. 1, Gabriel O'Connell Redmond, M.D., of Cappoquin, to Helen, eldest daughter of John Quinlan, Esq., Clonkerdin, co. Waterford.
- ROUTH—ROUTH.—Sept. 8, at the Parish Church, Hunstanton, Norfolk, Alfred Curtis Routh, of Constantinople, to Anne Julia Adèle, eldest daughter of C. H. F. Routh, M.D., of Montague Square, London.
- WALTON—KEELAN.—Sept. 1, at the Parish Church, Alverstoke, Hants, Haynes Walton, F.R.C.S., of Moon Street, London, to Kathleen, second daughter of Patrick Keelan, Fleet Surgeon, Royal Navy.

Deaths.

- BUTLER.—On Sept. 6, at Greenway House, Honiton, John M. Butler, M.D., late of Woolwich, aged 50.
- CARTER.—Sept. 8, at Dartmouth Terrace, Lewisham, S.E., R. S. Carter, M.R.C.S., aged 62.
- JORDISON.—Sept. 3, at South Oxendon, Essex, Robert Binks Jordison, M.R.C.S. & L.S.A., Medical Officer of the Oxendon District of the Orsett Union, aged 69.
- KINGSFORD.—Sept. 12, at Upper Clapton, C. Dudley Kingsford, M.D. St. And., M.R.C.S., aged 51.
- LEADAM.—Sept. 5, at his residence, Stratford House, Mortimer, Dr. J. E. Leadam, late of York Place, London, W., aged 71.
- PEACOCK.—Aug. 26, at Darlington, James Bailey Peacock, M.R.C.S.E., L.R.C.P. Ed., aged 48.
- SYMES.—Aug. 28, at Charles Street, Grosvenor Square, Edmond Shepard Symes, M.D., aged 76.
- WALLIS.—Sept. 3, at Bridgetown, Totnes, Albert J. Wallis, M.D., J.P., aged 39.

The Medical Press & Circular.

STUDENTS' NUMBER.

PART I.—The future of the Student in Private Practice or the Public Services.

PART II.—The Education and Qualification of the Student in the United Kingdom.

PREFATORY.

THE prospect of reform in medical education and practice, which have for close on five years served to suggest the remarks introductory to our annual "Students' Number," are still unaccomplished; but, notwithstanding, it is possible to regard them as much more imminent than was the case a twelvemonth ago. The Royal Commission which has been appointed to receive and consider evidence bearing on the past working of the Medical Act, and the direction in which they will admit of improvement, although holding its sittings in secret, may be nevertheless trusted to formulate a scheme under which many existing anomalies will be heard of for the last time, and the whole system of mischievous confusion attendant on professional qualification and practice in the past will be swept away. Under it we may expect to see multitudinous directions among examining bodies no longer existing to complicate the progress of medical education, and in their place one single test of absolute uniformity, by passing which alone the student will be entitled to register as a medical man. The advantages to be anticipated from such a sweeping and wholesome change need not be dwelt upon; they are now universally recognised, except by those who will be permanently injured in a pecuniary sense by the passage of the Medical Reform Act. It may be, perhaps, that this is the last occasion on which it will be our duty to present a sketch of the rules and regulations in force of nineteen licensing corporations in the United Kingdom; in this case our special number will be taken up with description of the schools rather than the systems obtaining at schools, and will be prefaced by an account of that central examination uniform throughout the kingdom, which is regarded by the wellwishers to the profession of medicine as the highest good that can accrue to it in the future.

We ought not, however, to overlook the fact, that in spite of all discouragement, the spirit of progress is strong within our midst, and that by virtue of it a steady advance is being made over the older and less desirable modes of education prevalent a generation or two ago. The training that a medical student undergoes at the present time is in every way better, and is in accordance with a loftier ideal than that our fathers

were submitted to. That it has been so is perhaps the truest proof we can obtain of possible improvement in the future, and all the more ought it to incite to determined efforts for gaining the goal now so temptingly close at hand.

We do not lack conclusive proof in plenty of the proud pre-eminence of British science. No country in the world has succeeded in triumphing over us in the matter of research and skill in connection with our profession, and it is with pardonable exultation that we are able to point to the recent magnificent International Congress held in London as a positive evidence of the unassailable position of medicine in this country. It is to the medical men of the future—the students of today—that the onus of supporting this position must fall, and of continually extending the field of conquest—in all pertaining to the profession it will be their privilege and duty to protect and to elevate. For them specially is this number of the *Medical Press and Circular* intended, as a guide to them in entering on and prosecuting the study of medicine and surgery. Much of the information condensed into these pages exist in the published prospectuses of the various licensing bodies, only in a perplexing and intricate way highly confusing to the uninitiated. We have carefully extracted the essential details, and arranged them, as far as possible, in an orderly and easily understood sequence; but in every case where fuller or further descriptions are needed these will be always immediately supplied by the secretary, registrar, or dean of the particular college or school. A good deal of the most useful information to a student is of the kind that calendars or prospectuses do not contain. Hints and suggestions are often of the utmost value if supplied when wanted, and by one who is conversant by experience with the difficulties that arise at the outset of a medical career. As many of these aids as possible have been embodied in this number of the *Medical Press and Circular*, and many more will be forthcoming from senior students and practitioners, whose advice ought at all times to be solicited by commencing candidates for medical honours. We will now proceed with the actual work of this number, adding only that in medicine, as in everything else in life, *palmarum qui meruit ferat*.

PART I.

THE MILITARY AND NAVAL SERVICES.

THE ARMY MEDICAL DEPARTMENT.

THE Royal Warrant, dated December 2nd, 1879, placed this branch of the public service pecuniarily in a better position than it had previously enjoyed. The rates of pay under that Warrant are as follows, viz., Surgeon-General, £2 15s. or if at headquarters, £1,300 yearly; Deputy Surgeon-General, £2, at headquarters, £900 yearly; Brigade Surgeon, £1 10s. at £1 12s., at headquarters, £750 yearly; Surgeon-Major, £1 to £1 7s. 6d., according to length of service, at headquarters, £650. Surgeon, £200; after 5 years' service, £250 a year; after ten years' service, 15s. daily, equal to, say, £273 per annum. While on probation the surgeon receives 8s. per day. Relative rank is as follows: as Major-General, Director-General, and Surgeon-General; as Colonel, Deputy Surgeon-General; as Lieutenant-Colonel, Brigade Surgeon, and Surgeon-Major after twenty years' service; as Major, Surgeon-Major of less than 20 years' service; as Captain, Surgeon; as Lieutenant, Surgeon on probation.

A candidate must possess two diplomas or licences, one in Surgery and one in Medicine; he must be registered. His age on appointment not to exceed 28 years. Appointments to be through public competition. Application to be made to Director-General. On passing satisfactorily through the Army Medical School at Netley he obtains his commission, the order of precedence being in that of merit at the final examination. Medical officers, soon after being gazetted to the service are sent to Aldershot and other large stations for instruction in ambulance and army hospital corps duties.

Promotion to the rank of Surgeon-Major to be after twelve years' service, three of which abroad; but for distinguished service promotion to be irrespective of seniority. To the rank of Brigade Surgeon promotion to be by selection for ability and merit, provided the Surgeon-Major has had eight years foreign service in all. From Brigade Surgeon to Deputy Surgeon-General, and from the latter rank to that of Surgeon-General, Promotion to be by selection. If appointed as Honorary Physician or Honorary Surgeon to Her Majesty, a medical officer, if under the rank of Deputy Surgeon-General, shall, if duly qualified, be promoted to that rank.

On completion of ten years' service a medical officer may retire on a gratuity or pension, if specially recommended by the Commander-in-Chief and Secretary of State for War. If retiring voluntarily before the age of 55, he is liable to be called upon to serve in the case of national emergency. A Brigade Surgeon, Surgeon-Major, or Surgeon, shall be placed on the retired list at 55 years of age. A Deputy Surgeon-General or Surgeon-General at 60. A step of honorary rank is attainable on retiring after twenty years' full pay service. Exchanges are permitted. Good Service pensions are granted in larger numbers than heretofore. Sick leave may be allowed for six months, and in special cases for a second period of the same extent—that is, a year in all. Temporary half-pay is granted under particular circumstances to medical officers incapacitated for duty by illness.

Non effective pay, or gratuity in lieu thereof is granted. To a medical officer of 10 to 18 years' service a sum of £1,250 to £2,500; Surgeon-Major from 20 to 30 years' service, £1 to £1 5s. 0d.; Brigade Surgeon £1 7s. 6d. to £1 10s.; Deputy Surgeon-General, £1 15s.; Surgeon-General £2.

Retired Medical officers, and medical officers of the Militia, are eligible for employment up to the age of 65, receiving during the time of such employment a consolidated salary in place of retired pay.

THE INDIAN MEDICAL SERVICE.

By recent regulations the conditions of service,

pensions and honorary rewards in the Indian Medical Department have been in a great measure assimilated with those of the medical branch of the general army. It is right however that we allude to the fact that rumours are in circulation regarding further changes in the constitution of the Indian Department.

The examination usually takes place in February and August, when Candidates are examined in the following compulsory subjects: a. Anatomy and Physiology. b. Surgery. c. Medicine, including Therapeutics, the Diseases of Women and Children. d. Chemistry and Pharmacy, and a Practical Knowledge of Drugs. The examination in Medicine and Surgery will be in part practical, and will include operations on the dead body, the application of surgical apparatus, and the examination of medical and surgical patients at the bedside. The eligibility of each candidate will be determined by the examinations in these compulsory subjects only. *Optional Subjects.*—Candidates who desire it will be examined in French, German, and Hindustani, Comparative Anatomy, Zoology, Natural Philosophy, Physical Geography, and Botany, with special reference to *Materia Medica*; and the number of marks gained will be added to the marks in the obligatory part of the examination, and position on the list of successful competitors will thus be improved in proportion. The maximum marks allotted to the voluntary subjects will be as follows: French, German, and Hindustani (150 each), 450 marks; Natural Science, 300 marks. The subjects for this part of the examination will be taken from the following books: "Animal Kingdom," by W. S. Dallas, F.L.S. "Outlines of the Structure and Functions of the Animal Kingdom," By Rymer Jones, or Cours Élémentaire d'Histoire Naturelle," by Milne Edwards. Lindley's "School Botany," Lindley's "Medical and Economic Botany," "Elements of Natural Philosophy," by Golding Bird and C. Brooka. "Physical Geography," by Mrs. Somerville.

PROBATION AT NETLEY HOSPITAL.

The competitor who obtains a place in the ordinary service is obliged to undergo probation of four months at Netley Hospital, where he attends the following lectures: Pathology, by Dr. Aitken; Military Surgery, by Dr. Longmore; and Clinical and Military Medicine, by Dr. Maclean; Military Hygiene, Dr. de Chaumont. The lectures on Military Surgery include gun-shot and other wounds; duties of army surgeons in the field, during sieges, on transport, &c., and other special subjects. Those on Military Medicine refer to the tropical and other diseases of the British possessions and colonies, and to the losses by disease. The lectures on Hygiene relate to the examinations of water, air, food, and clothing, &c., of the soldier, his duties and exercise, and the circumstances affecting his health, meteorology, statistics, and prevention of disease. The lectures on Pathology have reference chiefly to the scientific examination of tropical diseases, and of the other complaints which the army surgeon is especially called on to investigate. The candidates also attend the wards of the hospitals under the Professor of Medicine and Surgery, to make themselves acquainted with the system of recruiting, and the modes of keeping the Army Medical Returns. They are also called on to make post-mortem examinations, to operate on the dead body, and to pass through laboratory practice on the modes of recognising the qualities and adulterations of food, and on microscopic examination of morbid tissues, &c. During his preliminary training here the student is understood to be in Her Majesty's Service; he wears uniform, is under military discipline, and receives pay, as already stated. A sum of money, equal to the half-yearly interest on £1,200, the surplus from the "Herbert Memorial," is at the end of each session awarded to the candidate who has the highest number of marks, the fortunate young man who wins the "Blue Ribbon of Netley" being tolerably certain to be well provided for.

Each candidate has to pay £5 towards the mess fund, one-half on his arrival and the remainder when he has passed his second examination. He is then a member of the mess, and entitled to dine at any time during the remainder of his service. The cost of dinner is 2s. 4d. daily, not including wine, and of breakfast from 10d. upwards.

Passage allowance to India on appointment will be given or a passage provided. When passages are provided on board the Indian troop-ships, a charge for messing will be made at the rate laid down in the Royal Passage Warrant of 1865. Pay at 10s. a day will be allowed from date of passing final examination at Army Medical School.

Indian allowance and time of service for pension will reckon from date of arrival in India.

Surgical instruments are provided in India by the Government for the use of medical officers.

The pay of medical officers in the Indian service is better than at home, and, if unmarried, the cost of living not greater. The Indian medical officer frequently holds lucrative civil medical appointments, which afford him a handsome increase of income. To a healthy, temperate, unmarried man, the Indian service is preferable to that at home; but to a delicate person, or one burthened with a wife and children, the advantages are questionable.

For official regulations of the Indian Medical Service apply to the India Office, Whitehall, London, S. W.

NAVAL MEDICAL SERVICE.

The arrangements, time, and places for examination, the declaration to be made, and documents produced, the subjects and method of examination, and the subsequent probation at Netley, are to all intents exactly the same as those quoted above for the Army and Indian Medical Services.

Having passed his examination and served at Netley, the candidate will receive his appointment as acting surgeon to one of her Majesty's ships, either for service on board that ship, for service on shore, or at one of the naval hospitals—Haslar or Plymouth. He will be informed that he is granted two or three weeks, as he may require leave of absence, to enable him to provide his uniform and appointments. These he can get at any of the naval clothiers.

The expense of a surgeon's uniform is about £47 5s. The candidate must also provide himself with a set of surgical instruments, which will cost him from ten to fifteen guineas.

Fleet Surgeons to have the option of retiring after twenty years' full pay service in all ranks at 15s. per day, and after twenty-five years, 21s.

Medical officers share in the proceeds of all prizes.

The following rates of pay and retiring allowances are granted under Admiralty Regulations, dated 7th October, 1875, namely:—

Full-pay Surgeons from 11s. to 17s. per day, according to length of service. Staff Surgeons, £1 3s. to £1 10s.; Deputy Inspector-General, £1 11s. to £1 18s.; Inspector-General, £2 5s. to £2 10s. 6d.

Half-pay Surgeons, 6s. to 11s.; Staff Surgeons, 11s. to 14s.; Fleet Surgeons, 10s. to 18s. 6d.; Deputy Inspector-General, £1 1s. to £1 7s. 6d.; Inspector-General, £1 11s. to £1 18s.

Medical officers have rations according to their relative rank in the service.

THE CIVIL PUBLIC SERVICES.

A YOUNG qualified practitioner, indisposed to be an assistant, and desirous of commencing general practice without investing any money in purchasing a succession, may, perhaps, obtain a Poor-law appointment, though he should scarcely expect to obtain a livelihood from this

inadequately remunerated appointment; still in small provincial towns and villages it is oft-times the readiest passport to general practice.

There are many important differences between the Poor-law Service of Great Britain and that of Ireland. In England and Wales actual salary of office is, generally speaking, preposterously small, and as the medical officer contracts to supply medicine into the bargain his emoluments from this source are usually much less than nothing. In Ireland, on the contrary, the salary is substantial, and, as the medical officer does not contract to supply medicines, his payment is all profit. But the loss which the English union surgeon suffers in this way is counterbalanced by the extra fees which he receives for operations and various other items of professional work which in Ireland are included in the salary, but in England and Wales are paid for separately. Moreover, the appointment of medical officer of health, which in Ireland is a complete sham, is in England a reality, and is substantially remunerated; and vaccination fees and awards are also much higher in Great Britain than in Ireland. The extent and nature of the Poor law medical officer's work is also totally different in the two countries. In England, Wales, and Scotland no one but an actual pauper receives gratuitous medical relief. In Ireland the whole population of small farmers, petty shopkeepers, and artisans, and their families, are in the habit of sponging on the Poor-law for medical advice and medicine. Thus it is that in England the majority of the population pay the doctor, and his earnings are proportionately large, in Ireland the great majority pay nothing, and all the medical officer's time is occupied in running after his official duties, while his private practice, no matter what his professional character may be, is very often almost nil.

The inevitable effect of the English system is obvious. The interest of the Poor-law medical officer is to give to his pauper patients as little medicine as possible, and of the worst and cheapest quality, but to seize every possible excuse for an operation. If he allows a labour to terminate naturally he loses the fee payable for a forceps delivery, and in general it is money in his pocket to do something in the way of an operation and to starve the patient of his medicine, while it is dead loss to him to give the needful drugs and allow the patient to recover without interference. The Irish system, on the other hand, is just as mischievous by its effect in pauperising the whole community, who are taught by it to make no provision for the day of sickness, but to go whining to beg for *gratis* help when disease or injury overtakes them.

ENGLISH POOR-LAW MEDICAL SERVICE.

The English Poor-law Service differs in many respects from the Irish. Each parish in England and Wales has its guardians of the poor, and these parishes are grouped together to form unions. The unions are divided into districts for medical relief. Union medical officers therefore have the care of a district, and sometimes of a workhouse as well; sometimes only a workhouse. He is elected by the guardians of the union, and the appointment confirmed by the Local Government Board. He must have both a surgical and medical qualification, and be registered, and is required to name a duly-registered practitioner to whom application can be made in case of his absence from home; he can name his assistant or partner as his substitute. As a general rule, the guardians may not assign to any medical officer a district which exceeds in extent the area of 1,500 acres, or which contains a population exceeding 15,000 persons. This does not apply to Wales, but no such district may be assigned to a medical officer residing more than seven miles from any part of a parish included in such district. A medical officer is entitled to a fee of not less than 10s. or more than 20s. for attending a woman in or immediately after childbirth, and to a fee of £2 where great difficulty has occurred in delivery, or long subsequent attendance

has been necessary. Many of the salaries of Poor-law appointments are very low—often so out of proportion to the work done that the medical officer must give his services for nothing, or next to nothing, as he has to provide all medicines, instruments, &c., except trusses, cod-liver oil, and quinine, for which he sends a statement to the guardians, who pay him the cost price; the paupers have to put up with those medicines which cost the least. In London and large towns some boards of guardians provide dispensaries, where the paupers are supplied with medicine, which relieves the medical officer from much labour and expense. It ought to be compulsory on all boards of guardians to provide dispensaries, and where this cannot be done, as in country districts, to provide all drugs, &c.

Capital operations, dislocations, fractures, midwifery, and vaccinations are paid for by a fixed tariff. The public vaccinator is appointed by the guardians. He must be connected with the parish work; the candidate who has most interest is pretty sure of the appointment. The fees for vaccination are 1s. 6d. if performed at a workhouse or within a mile of the vaccinator's residence, 2s. between one and two miles, and 3s. over two miles. The guardians provide stations for vaccination where the vaccinator attends at stated times. He must be registered in medicine and surgery, and have obtained a certificate of instruction in vaccination from a public vaccinator authorised by the Privy Council; he is required to transmit the certificates of successful vaccination to the vaccinating officer within seven days. Awards of not more than 1s. per case are given for successful vaccination of children up to six months, and are given on the report of the Inspector to the Local Government Board if the marks are up to the standard, and the books properly kept. Only the relieving officers (and the overseers of the several parishes in cases of emergency) can give orders for medical relief. The relieving officer must inquire into the case, and, if necessary, visit the person before giving an order, unless the person is already on the pauper list. The medical officer can order nourishment and stimulants when necessary.

CLUBS.

In England and Wales (more especially in the manufacturing districts) the medical practitioner derives much of his income from clubs, which pay him from 3s. to 4s. per head yearly, for which he visits and supplies medicines, &c.; the average payment for each visit amounts to the large sum of about 6s. Small tradesmen, artisans, tenant farmers, labourers, &c., who would certainly be recipients of gratuitous relief in Ireland, are attended as private patients—of course, at lower charges than the better class of patients, and often either pay their bills by instalments or not at all. Parish appointments are often sought for by young men as an introduction to practice, or by older men to prevent opponents setting up in the district.

THE IRISH POOR-LAW MEDICAL SERVICE.

The newly-qualified medical practitioner who may elect to try his luck in the Irish provinces sets his hopes in the great majority of instances, upon obtaining one or more Poor-law medical appointments in some district where there is hope of private practice. There are 163 workhouses and about 793 dispensary medical officers, besides apothecaries. The number of vacancies that occur annually averages 100. The salary in this service averages about £103 15s.; and when it is taken into consideration that in the vast majority of rural districts, it is necessary to keep a horse, and in some a boat as well, the average area being from forty to sixty square miles, it is plain that there will not be a large margin left from the public emoluments. The medical officer is also *ipso facto* the registrar of births, marriages, and deaths, and medical officer of health for the district, under the Public Health Act passed in 1873 and amended in 1878.

The former office, in country districts, seldom yields

more than £10 a year, and often not half that amount, and the emoluments of the latter appointment in very few cases reach £20, averaging about £12. The medical officer is also vaccinator for the locality, and is required to vaccinate everyone who wishes to come. For each patient his fee of 2s. is paid, along with his salary, by the guardians, and the sum total of these fees varies, according to the populousness of the district, from £4 to £100, an average for the provinces being about £10. Despite the miserable salary, and the very many discomforts of dispensary life, these appointments are generally eagerly sought for—firstly, because they afford the new comer a certain, though hardly-earned salary, to supplement his private earnings; and, secondly, because, if not secured by the new comer, they would of necessity bring a competitor for office into the field, and inasmuch as private income is of far greater import than public earnings, country medical practitioners are obliged to undertake the public duty in order to save themselves the monopoly of their private emoluments.

Appointments.—The qualifications required by the Poor-law Commissioners are a License in surgery or a Diploma in medicine, and a Diploma in midwifery; the candidate must also be twenty-three years of age.

The appointment lies with Dispensing Committee, who elect by vote. As politics and religious feeling run high in Ireland, these elements enter largely into the election of Poor-law medical officers. Family interest also possesses great weight.

The candidate will do well to bear these facts in mind, as his personal attendance on the day of election will be required, and whatever other qualification he may have, he will then find that his compatibility in these respects with the majority of the committee is essential; and, accordingly, he had better first make himself acquainted with the local peculiarity, whatever it may be, before he enters on his candidature, otherwise, in all probability, any expenditure that he may make in the matter will be simply thrown away. We may here observe, also, that in very many instances the appointment is virtually made before the advertisement appears for a medical officer, in which case, also, candidates are put to unnecessary trouble and expense under false pretences.

Control.—Each district is under the control of a committee composed of the neighbouring landholders; the appointment of medical and other officers is made by this committee, and the entire management of the district is under their control. Their acts are, however, subject to the approval of the Local Government Board, who have the power either of interposing their veto on any appointment, or even expelling an officer by a "sealed order," without trial or accusation, or without the resource of appeal or investigation. The salaries and fees are paid by the Board of Guardians, and no change can be made in the amount without their assent and that of the Local Government Board. Under the late Sanitary Act the committee may recompense the medical officer for special services, such as those during an epidemic of cholera, or for sanitary reports.

Duties.—The duty of the dispensary doctor is twofold. He is to attend his dispensary on a given day or days in the week. Frequently there are two dispensaries in the district, separated from each other by several miles, and he will have perhaps to attend two days a week. He has also to visit at any hour of the day or night a sick person for whose relief a visiting ticket has been issued by a member of the committee or the relieving officer, and to continue his attendance as often as may be necessary to the termination of the same. Moreover, he has a great many registry books to keep and a multitude of returns to make, and in the majority of districts he has to make up all the medicines for the poor.

The pressure of these duties is in the greatest degree dependant on the goodwill of the members of his committee. If the medical man be a favourite with his masters, they will give him very little trouble with "scarlet runners," as the visiting tickets are, from the colour of

the paper on which they are printed, humorously called, and will be unwilling to trouble him even with cases deserving of personal attendance.

If, on the other hand, it is his misfortune to come in contact with some of the half-bred committee men, who know nothing of the treatment fit for an educated gentleman, or cherish a personal spite, the discharge of his duties may become simply unbearable. He may be peremptorily summoned, in any weather, at any hour, and to any distance, to a case which he may probably find to be altogether trivial, or to a person whom he may know to be perfectly well able to pay—aye, even to the committee man's own brother or daughter.

Workhouse Hospitals.—The number of unions in Ireland is 163, to each of which is attached a medical officer, who is appointed and controlled by the Board of Guardians in the same manner as the dispensary surgeon is by his committee. The salary is usually better than that of the dispensary doctor, and the duties of a more easy and satisfactory description, inasmuch as they are confined to daily attendance at the workhouse hospital, and no night visits out of doors or any long journeys across the country are involved.

Superannuation.—A Poor-law medical officer may now receive a pension not exceeding two-thirds of his salary on being incapacitated from illness or old age. This grant is strictly at the discretion of the guardians; nevertheless, it has been given in most cases in which physical incapacity has been clearly proved. There are now about 60 ex-medical officers receiving superannuation allowance, whose average term of service before pension was 20 years, and whose allowance averages about £60. Their average age at retirement was 63.

Complete information as to fees, emoluments, duties, and appointments of Irish Poor-law medical officers will be found in the "Irish Medical Directory" for 1881.

THE SCOTCH POOR-LAW MEDICAL SERVICE.

Practically these appointments, once made, are held *ad vitam aut culpam*, while in terms of the strict letter of the law, they are but yearly appointments. Arbitrary dismissal is, however, guarded against by the powers of the Board of Supervision. It is expected that soon Parochial medical appointments will be legally placed on the footing of permanent ones, and that a retiring allowance will be provided for the medical officers as is the case in Ireland. The emoluments received from the Parochial Boards vary according to the number of paupers, size of the parish, and often the local exigencies requiring the residence of a medical man. The salaries may be said to range, on an average, from £30 to £100 per annum. In remote and thinly-peopled districts the landed gentry and large farmers assess themselves in sums varying from £5 to £20, to make up an adequate income to the doctor, which however must be held in lieu of fees for medical attendance. Should such attendance, however, be much in excess of any such sum, the doctor is usually safe in trusting to the honour and generosity of the Highland gentleman, for this arrangement is more peculiar to the Highlands of Scotland. The young doctor has more speedy and easy access to "good society" in the country than in large cities; and perhaps better society than the latter; and should he be worthy of it, he is certain to command respect and courteous treatment, and with limited ambition and sporting tastes to lead an useful and happy life.

ASSISTANCIES, PARTNERSHIPS, &c.

MANY men, looking over the voluminous accounts of college curricula and university regulations, either for themselves or their sons, may naturally draw a deep sigh over the work to be done or the money to be spent, and exclaim, "What then?"—or, to quote Mr. Cobden's familiar expression, "What next, and next?"

Of course, the full and complete reply to these ques-

tions would fill a volume or two; but we may briefly indicate what can and what cannot be done, *as a rule*. (a) There are many exceptions, but we advise no one to think that he will escape the general rules which affect the mass of men.

First, there is private practice as a destiny and ultimatum. In Ireland and Scotland it is generally found that private practice worth having only exists in large towns; elsewhere, in these two divisions, medical men live chiefly on their appointments. In England this is not so; the appointments are subordinate to the practice everywhere; the succession to a practice can be very generally secured by purchase; but this is not so in Ireland or Scotland. But in England there are practices which cannot be bought; no money will command the highest class of practice; it is a personal thing which attaches to a man, and cannot be transferred. Partnerships are regarded as safe introductions to practice; but apart from the notorious charges for partnership, we regard them as greatly over-estimated in value. In considering a sphere for practice, the first question is the adaptability of the purchaser to what he contemplates. A suitable man will, as a rule, succeed to any practice where he is favourably and systematically introduced to the patients by his predecessors; but no man will undertake to resign his appointments and introduce a successor without a *quid pro quo*. Unless, therefore, a man has capital, he should not think of purchasing a practice.

For a partnership a considerable amount of capital is absolutely necessary for the following reasons:—1. A share in a partnership is not likely to be had for less than £1,000. 2. The junior partner has to live upon his own resources until the money earned in the practice after the date of his entry is paid. For example: If a gentleman enters a firm in April, and the bills are not sent out till the next Christmas, he will not receive anything on the partnership account for nearly a year after the date of his deed. But it may be asked why a partnership share is not likely to be had for less than £1,000? It may be taken as certain that no man will sacrifice a large share of his income to a partner unless it is absolutely necessary; in other words, no one takes a partner unless he has more than he can do, even with the aid of an assistant. Then comes the question, How much work will compel a medical man to take a partner? Not less than £1,200 a-year. Suppose a man purchase only a third share of this, it will cost him £800 on two years' purchase. If he pays £800 for the share of the goodwill, and a third of the value of horses, carriages, drugs and fittings, he will not have much left out of £1,000, and then he must provide for a year's expenses before much money comes in. Hence gentlemen with limited capital should never seek partnership investments.

A prevailing fallacy is that some man overworked wants a partner to relieve him of part of his work and—his income. If the practice is fairly good, the overworked gentleman can readily find a partner who will pay two years' purchase for the share secured. But some one wants to join him as a "working partner," and to pay nothing. Which is the overworked gentleman likely to accept—a junior partner, who will pay perhaps £1,000 for his share, and to whom he can delegate the greater part and all the drudgery of his work, or the junior who will do the same work, but will not pay the £1,000.

An assistantship is a capital discipline for any man. Such engagements are not what they used to be; the assistant in a medical practice being treated as a gentleman. But for details on this head we would refer to Langley's "Via Medica," which deals fully and fairly with this subject. No man should go out as an assistant without reading it, especially as it is to be found in nearly every college library.

Medical assistants may be divided into two classes, qualified and unqualified; but the salary which either will obtain is far more a question of actual experience than of the diploma which may be held in any given instance.

The experience obtained by an assistant in England, even though unqualified, may be sufficient to enable him to obtain a far higher salary than many gentlemen of much higher qualifications, but who are without knowledge of English practice.

To act as "Locum Tenens" it is essential that previous experience of practice should have been obtained. Irish gentlemen, as a rule, are very deficient in dispensing, and in the routine of English practice, which differs very materially from that which prevails in the sister isle, as medical men do not often dispense their own medicines in Ireland, and to this cause may in many cases be attributed the expression oftentimes seen, "No Irish need apply."

An assistantship, "with a view to partnership," is a thing that people read and write of, but seldom see. Experience shows it to be a mistake on both sides. If the assistant has money, he had better not appear in the practice as subordinate; if he has not the probation will not, as a rule, assist him to get a share in the practice.

If, however, a successful student declines to enter private practice as purchaser or as assistant, he may enter the public services through the open doors of competitive examinations.

Any one who seeks to enter the army, navy, or civil service should, however, look carefully at the prospects opened to him. As a general rule the prospective look-out is not quite so attractive as years pass by.

COLONIAL AND SHIP APPOINTMENTS.

There are certain appointments, however, which are obtained without difficulty which are often inquired about. The postal service to and between the West India Islands is an unhealthy service, but is not a bad one for men who can control themselves. The salary and perquisites are equal to about £200 a-year, with board and lodging. If a man lives through a few years, and does not fall a victim to the many temptations which present themselves, he may ultimately get promotion into the Cape line, which is regarded as a very good service.

To the Peninsular and Oriental Steam Company it is almost impossible to obtain entrance except by the personal influence of the directors. The same may be said of other steam lines which are popular. We have known candidates to wait with their names put down for two years without being sent for.

Colonists forming a new district sometimes club together to secure the services of a surgeon, and pay into a bank in the colony a guarantee fund. Such appointments are placed in the hands of respectable medical agents, who have representatives in the colony.

Practices abroad are rarely to be had or heard of. Sometimes they can be secured upon equitable terms; the contracts, however, should be always conditional upon the practice "out there" being found what it is represented to be. In such cases the intending purchaser should avail himself of the skill of some experienced and respectable medical agent.

In conclusion, it may be stated that whilst we have indicated generally the portals to success *after* the diploma has been obtained, we have no intention of ignoring the fact that men of decision of character, good antecedents and high qualifications, can and do secure distinguished positions in the profession, and occupy a large space in the eye of the world. But genius is the heritage of the few, and the great majority of men will do well to moderate their ambition, and seek to do their duty in the customary spheres of life in which many noble-hearted men have lived, worked, and died, leaving the world somewhat better than they found it.

(a) For further information we would refer the reader to Langley's pamphlet, "Advice on the Transfer of Medical Practices, etc."

PART II

EDUCATION AND QUALIFICATION OF THE STUDENT.

THE parent who desires that his son shall enter the medical profession, or the student who selects that calling for himself, is probably already aware in a broad way of the steps which must be taken to effect this purpose. He knows that in order to practise medicine or surgery legally in Great Britain or Ireland it is necessary to be enrolled in the Medical Register, and that, to obtain that distinction, it is necessary to study at a College and an Hospital for about four years, and afterwards obtain one or more diplomas by passing certain examinations in professional subjects.

The first point to be decided is whether the boy is of the proper age for studentship, and has received the requisite amount of schooling. As to the first of these points, circumstances impose a limit, because none of the Public Services will appoint to medical office any youth of earlier age than twenty-one, and it is therefore not only useless, but unadvisable, to complete the student's education until he has reached that mature age. Moreover, in England, no student receives credit for any part of his medical study, as counting towards his diploma, until he has passed his preliminary examination in general education, and the average boy will hardly be able to do this until he has passed his sixteenth year. For these reasons the majority of students do not commence their medical studies until they are seventeen or eighteen years of age, in which case they receive their diplomas between their twenty-first and twenty-third years.

The second consideration is whether the boy has been sufficiently schooled, and this is determined by his capacity to pass a recognised preliminary examination in general education. Of such recognised examinations the Medical Council publishes a list comprising most of the primary collegiate examinations throughout the world, but as to the extent and gravity of such examinations there are the most extraordinary variations. As a general rule the preliminary examination consists of Latin, English, and a moderate extent of Euclid, Algebra, and Arithmetic; occasionally modern languages and Greek, and also Natural Philosophy are added as optional subjects.

In England, and with most of the Scotch licensing bodies, it is essential that the student shall have passed his preliminary examination *before* he commences medical study. This has not hitherto been the case in Ireland, where it was possible, though not usual for the student to postpone his examination in general education until the eve of his professional examination. The preliminary examination is, however, not to be feared.

We strenuously advise the parents of the student to insist on his passing his preliminary education before he enters a medical school or hospital, and thus the student will relieve his mind of the apprehension of a future examination, which he will assuredly put off to the last moment if he can. In England and in the chief Irish colleges the four years of medical study required to pass do not commence to count until the preliminary is passed.

The preliminary examination having passed, it becomes

necessary to select the method of education to be pursued. It should first be decided what is to be the aim of the student in after-life, for upon that question will depend in great measure the school at which his studies are to be pursued.

THE CHOICE OF UNIVERSITIES AND COLLEGES

Will depend on various circumstances, and on the aspirations of the student. If he is intended to make a fortune and enlighten his generation as a metropolitan practitioner, and if money and education are plenty, he will probably take University degrees in arts and in his profession. If the attainment of good professional rank on moderate terms be desired, the Licenses of the "College and Hall," or that of the Royal College of Physicians for London, the Colleges of Surgeons and of Physicians for Ireland, or the Double Diploma of Edinburgh, will serve every purpose. For any University degree which are of any value, it is to be remembered the student must undertake the prolonged study of classics and science in addition to his medical, surgical, and anatomical studies; and he will have to pay a considerable sum for this course of teaching. But if he is content to face the expense and labour, he will enter the profession with all the prestige of an educated gentleman—in fact, the question whether he will or will not lay out for himself a University graduation in arts or medicine, depends principally whether he has money and time to give to it, and whether or not he means to practise in the metropolis. The University of Durham, the New Royal Irish University, and some of the Scotch Universities place at the disposal of the student a cheap University degree, and thereby attract many applicants who are at liberty to write M.D. after their names, and are not called upon for any prolonged University residence or academic study. These degrees serve as legal qualifications to practise, and pass for an academic Doctorate in Medicine amongst the uninitiated: but do not confer the prestige attached to the degrees of Oxford, Cambridge, or Dublin.

If the student elects to seek a University degree—other than that of the London University—he will, of course, pursue his Arts study in Oxford, or Cambridge, or Dublin, and his professional studies *pari passu*. If he be content with simple licenses to practise, he must attach himself to a School and Hospital. Here the English and Scotch systems differ widely from that in existence in Ireland. In London the usual course is for the Student to select a School which is suitable to his pocket and his locality of residence, and where he thinks he will get "good value." The School is almost always in immediate connection, and on the same premises as one of the hospitals. In Dublin, on the contrary, the Schools have no immediate connection with any hospital, and the pupils of a Dublin School are a heterogeneous gathering from all the hospitals in the city. In England a composition fee is accepted by many of the Schools, and is paid in one or more instalments, which fee entitles the student to the whole of the curriculum of lectures, dissections, hospital, &c., necessary for his diploma. In Ireland, on the contrary, the fee for every course of Lectures and for Hospital attendance is paid separately, usually at the period when the certificates are required—i.e., on the eve of the examination.

The following is a statement of the composition fee payable at each London and provincial School from the most expensive to the cheapest:—

Bartholomew's	}	£131	5	0
Gny's				
University College	}	125	0	0
King's College				
St. Thomas's				
St. George's				
St. Mary's				
London		94	10	0
Westminster		100	0	0
Middlesex		90	0	0
Charing Cross		91	7	0
Birmingham Queen's College or Manchester Owens College ...		105	0	0
Bristol		104	0	0
Liverpool... ..		96	12	0
Sheffield		81	15	0
Leeds		78	13	0
Newcastle		78	15	0

Diploma Fees not included.

These fees are close approximations, subject to additions for extras required for certain licenses. The fees may be paid in full at the entering of the student, or they may be paid in certain fixed instalments at the beginning of the successive periods of study, by which system the total payment is something larger than those above quoted. It will thus be observed that in England the student is encouraged to enter at a particular school and hospital and to take his whole education there, and, as a matter of fact, the great majority of students follow this course. It has its advantages, not the least of which is that it places the student under the absolute control of his teachers, and enables them to dictate his method of learning, and to supervise his diligence to a much greater extent than is possible elsewhere.

In Ireland, on the contrary, composition fees are a rare exception to the rule. The student goes to any school he pleases and any hospital he pleases, and enters his name for any number of lectures he pleases. If he does not like his school or hospital, he most probably migrates to a rival institution on the first opportunity. It is, in fact, but seldom that an Irish student confines his studies to a single hospital, and in order that he may be perfectly free to seek his education where he thinks he can best obtain it, it has been recently decreed by the Dublin hospital surgeons that perpetualism be abolished, and that no discount be allowed to students in consideration of their taking out their entire time at one institution.

The Irish system is open to grave abuses, which need not be dwelt on at present; but it has certainly the great merit of rendering the student perfectly independent, and forcing schools to compete energetically for a continuance of his patronage. It will be obvious, however, that the system which enables the student to pay a lump sum, and thus relieve himself of the trouble of entering for lectures, and paying fees in detail, is a convenient one, especially for the beginner, who is altogether ignorant of the system, and therefore the requirement which is provided for in England by the dean of the school, is met in Ireland by individual teachers or "apprentice" holders.

PAYMENT OF FEES IN IRELAND.

If the student be his own manager, he must enter his

name with the secretaries of the school and hospital, and pay for the lectures and hospital he intends to take out. If he is wise he will not adjourn the majority of his lectures, as he may to the next year, but will take in his first year a full third of his curriculum. He is supposed to pay the professor's fee or hospital fee in full on entering his name, but few students do so; and many, we are sorry to say, are in the habit of entering for the minimum allowable number of lectures, and paying the minimum allowable proportion of the fee, putting off the attendance perhaps for ever, certainly until the last moment, and adjourning the payment until it becomes necessary to take up the certificates.

By a most objectionable laxity of system a student may get credit for one of his four years of attendance by paying a couple of guineas for dissections, and he may think himself safe in doing so if money be scarce; but if he does not pay his full third or fourth of the fees each year it often happens that he has to put off his examination from year to year—perhaps for ever—for want of money to pay the accumulated fees of previous years.

REGISTRATION OF STUDENTS.

Having thus entered his name as a medical student, and acquired his right to commence study, his next business is to register himself as such on the General Medical Council.

To this body is entrusted the supervision of Medical Education, and it has made a number of recommendations, the majority of which have been accepted by all the Examining Bodies, and are consequently found in their regulations. The student has, therefore, nothing to do with the Council, except that he must take care to be duly registered as a Student in Medicine, at the commencement of his career, at the offices of the Registrar of the division of the United Kingdom in which he is residing. He must previously have passed a preliminary *Arts Examination*. With regard to registration, each student should apply according to a form, accompanied by a certificate, of his having passed such examination, the same to be lodged with the Registrar, who will thereupon enter the same in the Students' Register, and issue a certificate to that effect. It should be recollected that this commencement of the course of professional study is not reckoned as dating earlier than fifteen days before the date of registration.

The intention of such registration is to ensure that the student shall occupy four years in medical study, which is, theoretically, the period which must be devoted to his education before his entry to the profession. In England this requirement is set down as essential, and no student can present himself for examination sooner than four full years from the date of registration, but the obligation to occupy this period in medical study is frequently satisfied by a nominal service for the first year under a general practitioner, or in a provincial hospital or dispensary, and the actual period of medical study is often really three years. Besides, the standard of medical education, as well as of the examinations of various examining bodies, is so much higher than it formerly was, while our own knowledge of medicine and the collateral sciences, and the scope of our medical studies have recently become so enlarged that four years is by no means so long a period to be devoted to medical study; and even the diligent student will find that at the expiration of this term he will have but an imperfect acquaintance with several branches of his profession.

In Ireland the registration of medical students has hitherto been very irregular and unsatisfactory. No pupil thinks of giving himself any trouble in the matter, and leaves it to the Registrar of his School to return to the Branch Medical Council the names of his *alumni* which, for reasons the initiated understand, he frequently forgets to do. Henceforth students must be careful to register at the time when they begin study, because—if they omit to do so—they will not get credit for the courses of study commenced before registration.

FINAL REGISTRATION OF PRACTITIONERS.

All duly qualified persons are required by the Medical Act to be registered before they can hold any public medical or surgical appointment, or issue valid medical certificates.

The medical registration of any practitioner is effected on personal application or in writing (according to a form to be had in London or at either of the Branch Offices). With such application he must produce or transmit the *Diplomas*, and also the fee, £8, for the first registration, and 5s. for every qualification which may be subsequently added.

COST OF EDUCATION IN IRELAND.

Should the student proceed on his own account, the lectures necessary for the diplomas of the Colleges of Physicians and Surgeons in Ireland will amount to about £75; hospital attendance, according to the new scale of fees, £36; lying-in hospital, from £4 4s. to £7 7s. These, with the diploma fees of £26 6s. for the College of Surgeons, and £15 15s. for the College of Physicians, represent the essentials. Thus, the absolute payment will amount to somewhere about £100, taking the minimum mode of payment. In addition to this sum are to be considered the payment for "grinding" or "coaching," a process almost universal, but by no means necessary to any industriously inclined student. The fixed sum is at present for private teaching £15 15s. for the surgical and medical qualifications, and £5 5s. for pharmacy, &c. Should the candidate "grind" for the army and navy examinations, a fee varying from £10 10s. to £21 is, we believe, usual. Should the candidate perform operations on the subject as a practice, they will cost something extra. So that, assuming the extras or voluntary costs are incurred, the total will vary, say from £140 to £160 on a moderate scale: it is, of course to be expected that pupil holders should have some extra payment; we therefore might name for them 200 guineas.

This sum, or something like it, will secure to the pupil the advantage of being "apprenticed" to a teacher who will undertake all monetary responsibility for his education, and may be able to give him some special advantages as his own pupil at hospital, but it must, we fear, be confessed that the so-called apprenticeship is sometimes a simple contract for payment of fees, and involves but little of that special teaching which is due by a master to a true apprentice. Most of the apprentice holders will accept payment by instalments.

DATES OF ENTRY IN IRELAND.

The entry of names and commencement of study in Ireland is supposed to date from the 1st of October in each year, but the Session really does date from the 1st of November, and the entry of names may be delayed by the dilatory until the 25th of the same month.

The student then begins work, attending hospital each morning at nine o'clock, and occupying his day from half-past eleven to five between lectures and discussions. His holidays—if the term be not ignoble—are a fortnight at Christmas and a week at Easter, and he finally returns home at the end of July.

LECTURE ATTENDANCE IN IRELAND.

The average Dublin student is supposed to attend of necessity, and irrespective of voluntary courses, twelve courses of lectures, six of them extending over six months, and six over three months, making a total of 52 months lecturing. In addition to this, he is presumed to dissect and hear demonstration, say an hour and a half daily, for eighteen months, to attend hospital at least a couple of hours daily for twenty-seven months, to serve in the chemical laboratory for three months, and in the majority of cases to attend the "grind" for at least eighteen months for two more daily hours. He cannot, if moderately industrious, get on with less than two hours reading per day, and he may have during the same period to work up his business for the "Preliminary," or his Arts Course in

the University. This curriculum—taking the lectures on average of four days weekly represents nearly 5,000 hours close work to be got through in three working years of about seven months (allowance being made for Christmas and Easter and summer holidays).

Thus it will appear that the student, to fulfil the *nominal* requirements of his education in Dublin, must work very nearly nine hours daily—i.e., from after breakfast to about seven p.m. It is hardly necessary for us to say that even the most avaricious medical bookworm does not attempt such a task. Necessarily the attendance on many of the courses of lectures is nominal in amount. The University of Dublin insists on attendance of three-fourths of the number of the required lectures, but other licensing bodies accept as "diligent" attendance the presence of the student at all—a few—or none of the lectures which the student pays for. It would be manifestly ridiculous for them to demand *bona fide* compliance with the regulations, and thus it happens that the student being hopeless of attending at all, often attends scarcely any of the lectures which are supposed to form the chief part of his education. The average student thinks himself exemplary if he works his hospital, dissections, demonstrations, physiology lectures, and grind, and drops in occasionally to the other courses.

The progress of each year is the same, except that he usually devotes more attention to the "grinding," dissection, and hospital dresserships, and less to lectures in his later years of study. After the expiration of his last session, his student life, whether it begin in laziness and end in a hurry and incompetency, or whether it commence in diligence and end in the confidence of proficiency, ends with last examination, and he goes forth into the world either an ignoramus or a reliable surgeon, whichever his choice may have been.

THE ENGLISH UNIVERSITIES.

THE distinction of a university degree carries with it so many advantages, social and professional, that every student who can possibly obtain so desirable an additional qualification, will be consulting his best interests by straining every point in its favour. Of late years the facilities for obtaining the highest class degrees have so much increased, that an earnest and hard-working student not afraid of a good deal of extra labour, and with even average abilities, may readily gain for himself the distinguishing mark of culture conferred by graduation at one of the older seats of learning. The numerous scholarships open to general competition, and awarded at Oxford and Cambridge, &c., for proficiency in many of the subjects included in the preliminary medical curriculum, offer a ready means of meeting the extra expenses to be necessarily incurred at a university, as compared with the cost of ordinary qualification; and to this must be added the similar money prizes which, with only a slight additional labour, may be gained at the various hospital schools of medicine, and which will suffice to meet the major part of extra academical outlay. Moreover, the liberal alterations introduced of late years into the regulations for the medical degrees of Durham University, present a means whereby, with the sacrifice of less than twelve months of time spent "in residences" within the university bounds—and even this can be passed in regular medical study at the Newcastle-on-Tyne School of Medicine—any duly registered medical student can proceed to the examination for the M.B. Degree of that university. In the case of the chief remaining British seats of learning, a longer term of residence is a *sine qua non*; but there is, we repeat, every inducement to young and ambitious students, to equip themselves at a small increased cost with indisputable evidence of a more liberal and extended education. Nor must it be forgotten that one university—to wit, London—exact no requirements of any kind beyond the test of a severe examination from its candidates, thus making it possible for any student to proceed to its degrees provided he be intellectually qualified to obtain them. On one point there is a common agreement among the universities, that, viz., they will admit no one to their earliest examinations who cannot show himself to have received a sound preliminary education in arts; and the necessity for this on the part of the future medical practitioners is recognised no less now by all the examining boards of the kingdom.

Whatever the future ambition of the student, it will be wisest for him to be prepared with a view to ultimate graduation at a university, as thus will he be most effectively fitted to pursue the path leading to that goal, should opportunities arise for doing so. We will now briefly detail the principal features peculiar to the different universities in respect of graduation at each.

Oxford.

Every student in medicine must pass all the examinations for the degrees of B.A., and date the commencement of his medical studies from the final examination in arts or science. For the degree of B.M. two examinations must be passed, the first including Anatomy and Physiology (Human), Comparative Anatomy (chiefly the entozoa), and Physiology, Botany, Chemistry (theoretical and practical), and Physics, with Mechanics. All candidates, however, who have obtained honours in the School of Natural Science, or have passed the preliminary honour examination in Chemistry, Mechanics, and Physics, are not required to offer these subjects again at the first M.B. At the second examination he is examined in two of the ancient authors—Hippocrates, Aretæus, Galen, and Celsus—and in some one modern author, as Morgagni, Sydenham, or Boerhave, as well as in the principles and practice of Medicine and Surgery, the Diseases of Women and Children, &c., &c. The first, or scientific, examination may be passed immediately; and two years must elapse after passing the first, prior to the final examination for the same degree. A dissertation has to be publicly read three years after obtaining the M.B. before being eligible for the M.D. The medical examinations take place annually in Trinity Term.

Scholarships of value from £60 to £100 are obtainable at Christ Church, Magdalen, and other Colleges, by competitive examinations in natural science. Each year a Radcliffe travelling fellowship is competed for by those who, having taken a first-class at any of the public examinations of the University, or having obtained some University prize or scholarship open to general competition, proposed to graduates in medicine. The travelling fellows receive £200 a-year for three years, half this period being spent in study abroad.

The facilities for the study of medicine at Oxford are considerable, but unfortunately no attempt to utilise them is made or encouraged. It may be hoped, however, that this will, ere long, be entirely altered, and that Oxford may rank at least with Cambridge as a centre of medical education.

Cambridge.

At the University of Cambridge, five years of medical study are required, unless the student has graduated with honours as B.A. For the M.B. he must have resided nine terms in the university, and have graduated in arts. There are three examinations for this degree. The first is in chemistry, physics, and botany; the second, in anatomy (human and comparative), physiology, and pharmacy; and the third, in the usual practical subjects. Subsequently to the third examination an Act has to be kept, which consists in reading an original thesis, followed by an oral examination on the subject of the thesis. The M.D. degree may be taken three years after the M.B. An Act has to be kept, with oral examinations, and an essay has to be written *extempore*. There is also a degree of Master in Surgery, for which the candidate has to attend extra courses of lectures on anatomy and surgery. An examination in so much of State Medicines as is required by medical officers of health, will in turn be held. With respect to Cambridge (and almost the same apply to Oxford), a residence during nine terms—i.e., the greater part of each of three years—is by statute requisite to obtain any degree in arts, medicine, or any other subject. The actual cost of this to a student who keeps his terms by residence in a college is from £150 to £200 a-year. This, however, may include all payments to the University and the college—all fees, as well as clothes, pocket money, travelling expenses, &c. Non-college students have only to pay the university fees, which are very small. They lodge and board as they like; their expenses, therefore, are entirely in their own hands.

London.

The medical degree of London University is given to all and everyone who succeeds in satisfying the examiners of fitness to receive it. Women, as well as men, can proceed to it, irrespective of any consideration of residence or place of instruction; and during the academical year just past several

ladies have occupied distinguished positions in the lists of honours obtained at the scientific examinations preliminary to that for the M.B. It is the custom to regard this qualification as an unusual one in point of excellence; but the injustice thus done to the older university is one that ought not to be encouraged. The London examinations are stiff. Either because, as in matriculation, a smattering of innumerable subjects is demanded, or, as in the more advanced examinations, insistence is placed on a fleeting knowledge of abstruse or intricate problems. It cannot justly be said that either of these plans must of necessity secure a better educated practitioner than a "right down," honest, plain, straightforward examination on the subjects that must be known. The one method ensures a "showy" graduate; but the other may be equally well trusted to produce a sure and sound doctor. London, however, does good work by offering to studious men against whom the other universities are closed by the "residence" clause, the opportunity of obtaining a medical degree, and in this way it accomplishes a desirable end. That man, whencesoever his qualification has been derived, who loves his profession for its own sake, will advance in it, and by it, and it is surely time we heard the last of this or that body's superiority in a *medical* sense. It is quite possible to accord all legitimate admiration for the greater degree of general cultivation distinctive of the holders of various university degrees as evidenced by such degrees; but the assumption that goes with it that the elements of technical education are more embodied in some than in other examining boards' schemes, is an unfair aspersion of the schools, which are the first sufferers. All will admit, however, that the best trained practitioners are such as have enjoyed the most liberal opportunities of general culture, when this has been introductory to the study of medicine. The University of London, therefore, is a serviceable corporation, in that it offers facilities *to all* to put the hall-mark of a university degree on their attainments.

Those students who intend to graduate at the London University arrange their studies as to pass the preliminary scientific examination *before commencing their regular medical studies*, taking a preliminary year for the purpose of preparation. In this way much knowledge will be gained which will go to clear the way for his first year's studies, which would otherwise be much encumbered.

The preliminary scientific examination commences on the third Monday in July, and no candidate is admitted to it unless he has completed his seventeenth year, and has passed the matriculation examination. The subjects on which he will be examined are—Inorganic chemistry, experimental physics, botany, vegetable physiology, and zoology. Candidates who shall pass on all these subjects, and shall also pass at the *same time* in the pure mathematics of the first B.Sc. examination, or shall have previously passed the first B.A. examination, shall be considered as having passed the first B.Sc. examination. There are in this, as in every other stage of the graduate's career, examinations for honours, which afford the student the opportunity of gaining highly-prized distinctions in various branches, such as valuable scholarships, exhibitions, and prizes. The medical and scientific degrees of the University are—Bachelor and Doctor of Medicine, Bachelor and Master in Surgery, and Bachelor and Doctor of Science. For the regulations respecting these examinations the students should apply to the Registrar of the University.

It has come to be generally felt that scientific knowledge, to be real, must be practical as well as theoretical, and that a thorough knowledge limited to a comparative small range is preferable to a slighter acquaintance spread over a more extended area. In the first examination for Bachelor of Science, which every candidate will be required to pass, the programmes in mathematics, experimental physics, and inorganic chemistry, have been carefully revised. In place of the superficial acquaintance with both zoology and botany formerly required at this examination, there is a single examination (written and practical) in general biology, in which a more thorough knowledge is required of the simplest forms and elementary phenomena of animal and vegetable life. The regulations for the second B.Sc. examination, on the other hand, are framed with the view of allowing the candidates to bring up any three of the following nine subjects:—(1) Pure mathematics, (2) mixed mathematics, (3) experimental physics, (4) chemistry, (5) botany, including vegetable physiology, (6) zoology, (7) animal physiology, (8) physical geography and geology, (9) logic and psychology. Moreover, in

the matricular examination which forms the basis of the science curriculum, German may now be taken in substitution for Greek. In regard to the Doctor's degree, a change has been made in favour of candidates who prolong the interval between their first and second examinations for the degrees of Bachelor from one year to two or more, as such will be allowed to come up for the degree of Doctor of Science within a year of their attaining the degree of Bachelor.

A special examination is held once in every year in subjects relating to public health, to which those candidates only are admitted who have passed the second M.B. Examination at least one year previously. Candidates will be examined in chemistry and microscopy, as regards the examination of air, water, and food; meteorology, geology, physics, and sanitary apparatus, vital statistics, hygiene, and sanitary laws, full particulars of which may be obtained from the Registrar.

All the medical degrees of the London University being open to women, valuable scholarships have been founded for their special benefit in connection with them.

University of Durham.

Two licences and three medical degrees are conferred by this university—viz., Licences in Medicine and Surgery, with degrees of Bachelor of Medicine, Master of Surgery, and Doctor of Medicine. A certificate of proficiency in sanitary science is also awarded.

With regard to the degree of Bachelor of Medicine, no one will be admitted to that degree unless he has kept one year's residence at the Durham University College of Medicine, and in the case of non-university men an additional arts examination to the professional examination must be passed. There are two professional examinations for the M.B., the first being held twice yearly in October and April, and the second twice yearly in December and June. In the year 1881-82, the first will commence on October 10th, 1881, and again on April 24th, 1882, and the second on December 5th, 1881, and again on June 19th, 1882.

No grace for the degree of Doctor of Medicine will be granted unless the petitioner is a Bachelor of Medicine of the standing of twenty-one terms (severn years) at least from his registration or matriculation, and of two years at least from his admission to the degree of Bachelor of Medicine, nor unless he has written an essay based on original research or observation on some medical subject selected by himself, and approved of by the Professor of Medicine.

For the degree of Master in Surgery the candidate must have passed the examination for the degree of Bachelor in Medicine, and must have attended one course of lectures on operative surgery. Each candidate will have an additional paper on surgery, and will have to perform operations on the dead body, and to explain the use of instruments.

There is also an examination and a certificate of proficiency in sanitary science. Hospital practice can be attended at the Newcastle Infirmary, which contains 230 beds. There are four scholarships of £25 a year, tenable each for four years, one being awarded each year; subjects, those included in the preliminary arts examination. Dickinson Memorial Scholarship, £15, tenable for one year, for general proficiency. Tulloch Scholarship, £20, tenable for one year, for anatomy, physiology, and chemistry. Charlton Memorial Scholarship, £35, tenable for one year, for medicine. Gibb Scholarship in pathology, £20, tenable for one year. Four times in the year two resident medical assistants, two resident surgical assistants, three non-resident clinical clerks, and sixteen non-resident dressers (eight for the in-patients, and eight for the out-patient department), are nominated by the Medical Board, and, if approved, are appointed by the house committee for three months.

Assistants in the pathological department, and two assistants to the dental Surgeon, are appointed in March and October.

With regard to fees, a composition fee for all the Lectures payable on entering to the first winter session, £52 10s., separate courses of lectures each £4 4s. Twelve months'

hospital practice £7 7s.; six months, £5 5s.; three months, £4 4s.; perpetual fee, £17 7s.; or if paid by instalments, first year, £7 7s.; second year £6 6s.; third year £5 5s. These fees also are payable in advance.

Victoria University.

For the regulations concerning the Medical Faculty of Victoria University, see *Owens College* under *Provincial Schools*.

Foreign Universities.

An essay on "Foreign Degrees and how to obtain them." giving information much sought for, but not readily obtainable in this country, together with the routes and fares to, and from, the different university towns of the continent, appeared in the *Medical Press and Circular* for October 1, 1879.

Royal College of Physicians.

The licence of the Royal College of Physicians, which is recognised by the Local Government Board as a double qualification, is rapidly growing in favour with candidates for a registrable diploma. The wonder is that it has not sooner become the generally sought qualification, the honourable *prestige* of the College, and the equal strictness of the examinations alike being such as should approve it to students. Certain changes in the scheme of examination for licentiates are now in force at this college. Three examinations will have to be passed under the new rules. The college comprises three classes of member, viz., *Fellows*, *Members*, and *Licentiates*.

The Fellowship.—The Fellowship of the College is attainable only by election, and no one can be proposed who is not a member of at least four years' standing.

The Membership.—A person may become a member without holding a degree in medicine, or indeed, any diploma. But every candidate who shall have commenced his professional studies after September, 1861, shall satisfy the Censors' Board that previous to such commencement he has obtained a degree in Arts from some university of the United Kingdom or of the Colonies, or from some other university specially recognised by the Medical Council, or that he has passed examinations equivalent to those required for a degree in Arts. The curriculum extends over five years.

The following additional regulations for the membership came into force on Jan. 30th, 1878:—1. Any candidate who shall produce satisfactory evidence of having passed an examination on chemistry and materia medica, required for a degree in medicine at a university in the United Kingdom, in India, or in a British Colony, will be exempted from re-examination on these subjects. 2. Any candidate who has already obtained the degree of Doctor or Bachelor of Medicine at a university in the United Kingdom, in India, or in a British colony, or who shall have obtained a qualification entitling him to practice medicine or surgery in the country where such qualification has been conferred, wherein the course of study and the examinations to be undergone previously to graduation shall have been adjudged by the Censors' Board to be satisfactory, shall be exempt (if the censors shall think fit) from all or any parts of the examinations hereinbefore described, except such a relate to the third or pass examination.

Graduates in medicine of any British university are admitted to an examination for the membership. Such graduates are exempt from some parts of the examination—e.g., anatomy and physiology. Even graduates of accredited foreign universities have no difficulty in being admitted to examination. All persons who have been admitted before February 16, 1859, licentiates of the College, and also all extra licentiates who are not engaged in the practice of pharmacy, may be proposed to be admitted a member of the College. Every candidate for the membership is expected to pass an examination, but there are certain cases, referred to under sections 15, 16, and 17 of the bye-laws of the College, in which the candidate is exempt from some portion of the examination.

The Licence.—The Licence of this College is a qualifica-

tion to practice medicine, surgery, and midwifery, and is recognisable by the Poor-law Board as a qualification in surgery as well as in medicine, but unless a graduate in some university he is forbidden to use the title of doctor; we regret, however, many do so. It was regarded at first as a diploma for the general practitioner, intended to supersede that of the Apothecaries' Company. The examination is conducted by specially-appointed examiners, and is complete in the several departments. There are three examinations for the licence, the *first* of which may be passed after registration, provided the candidate has been instructed in Chemistry, Materia Medica, Botany, and Pharmacy; *second* examination after eighteen months' study; and the *final* and the end of the fourth year. The fee for the College Licence is fifteen guineas, of which five are to be paid on admission to each examination.

Every candidate will be required to produce satisfactory evidence of having completed the course of study in accordance with the bye-laws and regulations of the College, which may be obtained of the Registrar, and to pass the professional examinations conducted by the Examining Board.

Any candidate who shall produce satisfactory evidence of having passed an examination on Chemistry and Materia Medica, &c., required for a degree in medicine at a university in the United Kingdom, in India, or in a British colony, will be exempted from re-examination on those subjects. Any candidate who shall have obtained a qualification which entitles him to practice medicine or surgery in the country where such qualification has been conferred, after a course of study and an examination equivalent to those required by the regulations of the College, shall, on production of satisfactory evidence as to age, moral character, and proficiency in vaccination, be admissible to the pass examination, and shall be exempt from re-examination on such subjects as shall in each case be considered by the Censors' Board as unnecessary. In the same way re-examination in Anatomy and Physiology is not required of those who have already passed a satisfactory examination elsewhere.

Royal College of Surgeons of England.

This College has exercised much influence over the profession, for without the M.R.C.S. it is not easy to obtain any English surgical appointment. Its membership, although no longer essential, yet carries some weight in a parish appointment. For this reason most English students take this diploma, which, together with a medical qualification, suffices for every purpose of the general practitioner. The College gives four diplomas—the membership, fellowship, a diploma in dental surgery, and one in midwifery, which last is, however, mostly confined to those who are already members.

The Membership.—This diploma gives no vote in the affairs of the College. It is only a licence to practice, and corresponds with the licentiateship of the Edinburgh and Dublin Colleges.

In future, candidates for the diploma will be examined in the practice of medicine, although there are certain conditions on which he can claim exemption. He must also have passed the preliminary examination of the College, or one that is recognised by the College. There are now two professional examinations for the membership, the Primary and the Pass.

The Fellowship.—Members of long standing are often admitted to the fellowship by election. As, however, this grade is obtainable by examination, is of greater value, and needs no personal influence, men who have sufficient time and ability prefer the F.R.C.S. after examination.

MEDICAL SCHOOLS OF LONDON.

LONDON possesses eleven general hospitals to which a medical school for the training of students is attached, and one or other of these must be chosen as the seat of his

labours towards qualification by every one intending to register himself as a metropolitan medical student. The selection may be a matter of some difficulty, but in many instances it will be guided by the advice of friends well acquainted with the advantages of this or that institution. Opportunity should nevertheless be taken to make a personal inspection of such hospitals and colleges as may specially approve themselves to the mind of the future student; a hasty decision is wholly inadvisable, for nothing, probably, is more likely to create disgust in the mind than a feeling of regret at having permanently joined a school which compares unfavourably with other places as these become more familiarly known. We cannot offer any direct advice as to which are and which are not good schools, since the favour in which different centres are held must largely depend on the particular circumstances under which the student commences his career. It may be generally said that no hospital can claim absolute superiority in all respects over its rivals, for at all every endeavour is carried out to render them efficient and sufficient centres of medical education. In some cases the medical and surgical practice offers special features; in others the teaching arrangements are more thoroughly studied; but everywhere, it may be said, the student's interest is a primary consideration with the tutorial and professional staff alike; and with fair application and reasonable ability any student of medicine in a London hospital should find nothing to hinder his progress, or prevent him from duly qualifying. We cannot do better than repeat the advice we gave last year, however, to all who are called upon to decide more or less of their own accord, as to which of the eleven hospitals shall have the honour of enrolling them on their lists of *alumni*—viz., hear and see as much as possible yourself concerning all the London hospitals, and then, having duly compared the facilities offered by each with your own idea of your requirements, decide accordingly.

APPOINTMENTS, PRIZES, NEW SCALE OF FEES, &c.

ST. BARTHOLOMEW'S HOSPITAL.—*Appointments:* Four house-physicians and four house-surgeons are appointed annually without fee; each is provided with rooms and receives a salary of £25. A resident midwifery assistant and an ophthalmic house-surgeon are appointed every six months; they are provided with rooms, and receive a salary of £25 per year. The assistant chloroformist, salary £25 and rooms; in-patient clinical clerks; clerks and dressers to the assistant physicians.

Scholarships, &c.—There are two open scholarships in science, value £130, tenable for one year; Jeaffreson exhibition, value £50, tenable for two years; preliminary scientific exhibition, value £50, tenable for one year; three junior scholarships, of £50, £30, and £20 respectively; Treasurer's prize for practical anatomy; Foster prize for practical anatomy; senior scholarship, value £50, for anatomy, physiology, and chemistry; Wix prize; Hichens prize; Lawrence scholarship and gold medal, value 40 guineas, for medicine, surgery, and midwifery; two Brackenbury scholarships in medicine and surgery; Bentley prize, for reports of surgical cases; the Kirkes gold medal for clinical medicine.

Scale of Fees.—Fees for perpetual attendance on lectures and hospital practice, 132 guineas, payable in the following instalments: First winter, 40 guineas; first summer, 46 guineas; second winter, 46 guineas; or a single payment of 125 guineas. Fee for general subjects for students of dental surgery:—First winter, 31½ guineas;

or a single payment of 63 guineas. First summer, 31½ guineas.

CHEARING CROSS HOSPITAL.—*Appointments:* Medical and surgical registrars, each with a salary of £40 a year; resident medical officer, assistant medical officer, resident surgical officer, assistant surgical officer, resident obstetrical officer, assistant demonstrator, pathological assistant, clinical clerks and dressers. The resident officers are provided with rooms and commons, and the assistant officers with commons, in the hospital.

Scholarships, &c.—Two entrance scholarships of £30 and £20 respectively, tenable for one year; the Llewellyn scholarship of £25, open to all matriculated students who have completed their second year; the Golding scholarship of £15, open to matriculated students who have completed their first year; the Pereira prize of £5; the Governor's clinical gold medal. Silver and bronze medals and certificates of honour are awarded to the most deserving candidates in the various classes.

Scale of Fees.—Composition fee for matriculated students, £81 7s., payable in instalments, or first year's fee, £38 17s.; second year's fees, £36 15s.; third year's fees, £10 10s. Composition fee for the course of dental surgery, £42 2s. A handsome and commodious new school building is now approaching completion, and will be shortly available for the work of the College.

ST. GEORGE'S HOSPITAL.—*Appointments:* House physicians and house surgeons are elected half-yearly from among the perpetual pupils. They are entitled to hold their appointments for twelve months, and to board and reside in the hospital, free of all expense. Assistant house physician; assistant house surgeon; obstetric assistant, with a yearly salary of £100, and board and residence in the hospital; pathological curator, with a salary of £50, microscopical pathologist, with a salary of £25; medical and surgical registrars, each with a salary of £50 per annum; assistant medical registrars; assistant surgical registrars; ophthalmic registrar; ophthalmic assistant; demonstrator of anatomy, with a salary of £50; senior assistant demonstrator, with a salary of £20.

Exhibitions, &c.—The Brown exhibitions, one of £100 per annum, tenable for two years, and open to perpetual pupils possessing a registrable diploma; and one of £40 per annum, tenable for three years, and open to students in their third year. The Brackenbury prizes; one each in medicine and surgery. The Clarke good conduct prize, the Thompson medal, the Brodie clinical prize in surgery, the Acland clinical prize in medicine, the Johnson memorial prize in anatomy, the Treasurer's prize, and three general proficiency prizes of ten guineas each.

Scale of Fees.—Competition fee for perpetual pupils, £125, or in the following instalments: First year £45, second year £45, third year £40. For attendance on the hospital practice and lectures required by the examining corporations, £45 for the first year, £45 for the second year, and £30 for each succeeding year. The latter scale of payment does not entitle the pupil to become house physician or house surgeon, or to compete for the Brown exhibitions. The fee for general subjects in dental surgery is £55, payable in two instalments, first year £30, second year £25.

GUY'S HOSPITAL.—*Appointments:* The house-surgeons and house physicians, the obstetric residents, clinical assistants and dressers, are selected from the students, according to merit, and without payment. There are also a large number of junior appointments, every part of the hospital practice being systematically employed for instruction.

Scholarships, &c.—Open scholarship of 125 guineas, in classics, mathematics, and modern languages. Open scholarship of 125 guineas, in chemistry, physics, botany, and zoology. Six scholarships, varying in value from £10 to £50 each, for general proficiency in medical study. The Joseph Hoare prizes; the Treasurer's gold medal in medicine; the Treasurer's gold medal in surgery; the Gurney Hoare prize of £25, for clinical study; the Sand Cox scholarship of £15 per annum for three years, for physiology

and physics; the Michael Harris prize of £10, for anatomy.

Scale of Fees.—For the entire course of lectures and hospital practice, 125 guineas if paid in one sum on entrance, or by two equal instalments of £66, payable at the commencement of the first winter, and of the following summer session; or payment may be made by instalments of £50, £50, and £37 10s., payable at the beginning of the first, second, and third years respectively. Fee for the dental course, 63 guineas, or in two annual instalments of 40 guineas and 23 guineas.

KING'S COLLEGE HOSPITAL.—*Appointments:* One physician's assistant, two house-surgeons, and one physician-accoucheur's assistant appointed every six months. They are supplied with board and residence in the hospital on payment of £30 each. Assistant house-physician, assistant house-surgeon, and assistant resident accoucheur appointed every six months; in-patient clinical clerks and dressers; out-patient clerks and dressers; obstetric clerks, ophthalmic, dental, and aural assistants; post-mortem clerks; assistant demonstrators and prosectors of anatomy.

Scholarships, &c.—Three Warnford scholarships, each of the value of £25 per annum, two tenable for three years, and one tenable for two years; one Warnford scholarship of £25 per annum, tenable for two years, open to resident students; three junior scholarships of £20 each, tenable for one year, and open to students of the first year; one second year scholarship of £30, tenable for one year, and open to students of the second and third years; the senior scholarship of £40, tenable for two years, and open to students of the third and fourth years; Daniell scholarship of £20 per annum, tenable for two years, for work in the chemical laboratory; two Sambrook registrarships, each of £50 per annum; two science exhibitions of £50 and £25; two Warnford prizes of £25 and £15 respectively; Leathes prize; Todd medical clinical prize; Jelf medal; Tanner prize of £10 for obstetrics. Class prizes, each of the value of £3, are awarded annually in particular subjects.

Scale of Fees.—Payment for the entire course of hospital practice and college lectures may be made in one sum, viz., £125 on entrance, or by the following instalments:—£70 and £60, or £60 on entrance, £50 at the beginning of the second winter session, and £25 at the beginning of the third winter session. Fees for the dental course, £95 1s. 6d.

LONDON HOSPITAL.—*Appointments:* The resident and other hospital appointments are free to full students. The resident appointments consist of five house-physicians, four house-surgeons, and one accoucheurship; also two dresserhips and two maternity assistantships.

Scholarships, &c.—Two entrance science scholarships, value £80 and £40, and two Buxton scholarships, value £30 and £20, will be offered for competition at the end of September to new students. Entries on or before September 20th. A scholarship, value £20, in human anatomy, to first year's students; a scholarship, value £25, in anatomy, physiology, and chemistry, to second year's students; a scholarship, value £20, in clinical medicine; a scholarship, value £20, in clinical surgery; a scholarship, value £20, in clinical obstetrics; the Duckworth Nelson prize, value £10 (biennial), in clinical medicine and surgery. Prizes, value £60, to dressers of out-patients, in minor surgery.

Scale of Fees.—Perpetual fee for lectures and hospital practice, and two years' practical anatomy, payable in three instalments of 40, 35, and 25 guineas, at the commencement of the 1st, second, and 3rd years respectively, 100, or if in one payment, 90 guineas. Composition fee for students entering at or before the beginning of their second winter session, their first year having been spent elsewhere, payable in two instalments of 40 and 35 guineas, 75 guineas; or if in one payment, 70 guineas. Perpetual fee for lectures alone, 50 guineas; perpetual fee for hospital practice alone, 50 guineas; dental

students (general hospital practice and lectures), 40 guineas; perpetual fee for dental practice, 10 guineas. Special advantages in the shape of reduced fees are offered to full students, who, having attended classes in natural science at other places, succeed within a certain time in passing the preliminary scientific local examination.

ST. MARY'S HOSPITAL.—*Appointments:* There are four resident medical officers, three of whom are appointed for twelve months, and one, the obstetric officer, for six months; all of them live, free of every expense, in the hospital. Two prosectors, appointed annually, a demonstrator of anatomy, a medical tutor, and a resident registrar, each with a salary of £100 a year, appointed annually, and eligible for re-election. Clinical clerks and dressers.

Scholarships, &c.—Two scholarships in natural science tenable for three years; an exhibition in natural science of £20, tenable for one year; a scholarship in anatomy of £20, tenable for one year; a scholarship in pathological anatomy of £40, tenable for one year. At the end of each session prizes ranging in value from £2 2s. to £4 4s. are given for proficiency in particular subjects.

Scale of Fees.—For unlimited attendance on lectures and hospital practice £125 guineas if paid by instalments or 119 guineas if paid in one sum. Fee for hospital practice and lectures required by the examining bodies, 107 guineas in instalments, or 101 guineas in one sum. Fee for dental students, 62½ guineas.

MIDDLESEX HOSPITAL.—*Appointments:* Two house-surgeons three resident physician's assistants, resident obstetric physician's assistant. The above officers have residence and board in the hospital free of expense, but they pay on appointment fees varying according to circumstances from 10 to 30 guineas.

Scholarships, &c.—One entrance science scholarship of £50; Two Broderip scholarships of £30 and £20 per annum respectively, tenable for two years, for medicine and surgery; two entrance scholarships of £25 and £20 per annum respectively, tenable for two years; John Murray medal and scholarship, awarded every third year; the Governors' prize of £21; clinical prize of £10 10s. class prizes in particular subjects.

Scale of Fees.—General fee for the entire course of hospital practice and lectures, £90, if paid in one sum on entrance or by instalments of £40, £35, and £20, payable at the commencement of the first, second, and third years respectively, and £10 for every additional year's attendance. Course of dental surgery, £42, payable in two instalments of £30 and £15.

ST. THOMAS'S HOSPITAL.—*Appointments:* Two house-physicians, two house-surgeons, a resident accoucheur, two assistant house-physicians, two assistant house-surgeons, holding office for three or six months. The assistants are non-resident, but the other officers are provided with rooms and commons in the hospital free of expense. An ophthalmic clinical assistant, with salary of £50; surgical ward clerks, clinical clerks and dressers to in-patients and out-patients, obstetric clerks, two hospital registrars, each with a salary of £100; assistants in the dissecting-room, prosectors, pathological assistants, and assistants in the physiological laboratory.

Scholarships, &c.—Two entrance scholarships in natural science of £100 and £80 respectively; for first year's students the William Tite scholarship of £30, and four college prizes, ranging in value from £10 to £20; for second year's students, the Musgrove scholarship of £42, and college prizes ranging in value from £10 to £20; for third year's students, three college prizes of £20, £15, and £10 respectively. In addition there are awarded the Cheselden medal for surgery, the Mead medal for medicine, the Solly medal for reports of surgical cases, the Grainger testimonial prize of £20 for a physiological essay, and the Treasurer's gold medal for general proficiency.

Scale of Fees.—For the entire course of hospital practice

and lectures, £125, paid on entrance, or £130 in two payments, £70 on entrance, and £60 at the beginning of the next year; or by three instalments of £60, £50, and £30, at the beginning of the first, second, and third years respectively. The fee for the attendance on the *general* subjects required of students in dental surgery is for the two years £45, or by instalments; £50 for the first year, and £10 for the second year.

UNIVERSITY COLLEGE HOSPITAL.—*Appointments:* Six physicians' assistants, six house-surgeons, and four obstetric assistants, are selected annually by examination from among the senior students without additional fee. They reside in the hospital, paying only for their board, and have charge of the resident patients in the absence of the physicians and surgeons. The offices of physicians' clerks, surgeons' dressers, surgical ward clerks, and ophthalmic surgeons' assistants, are selected from among the pupils who are also students of the college, without additional fee.

Scholarships, &c.—Three entrance science exhibitions of 100*l.*, 60*l.*, and 40*l.* respectively, tenable for two years; Atkinson-Morley surgical scholarship, of 45*l.* a year, tenable for three years; Atchison scholarship, value about 55*l.*, tenable for two years; Sharpey physiological scholarship, value about 70*l.* a year, tenable for three years; Filliter exhibition for proficiency in pathological anatomy, value 30*l.*; Dr. Fellows' clinical medal; the Liston gold medal; Alexander Bruce gold medal; Cruik memorial prize; class medals, &c.; gold and silver medals, or other prizes, as well as certificates of honour, are awarded, after competitive examinations in particular branches of study. Prizes to the value of 10*l.* will be given in the class of hygiene. The Jews' commemoration scholarship of 15*l.* for two years; the Tufnell scholarship of 100*l.* for chemistry, two years; and the Clothworkers' exhibition of 50*l.* for two years, can also be held in the Medical Faculty.

Scale of Fees.—125 guineas, if paid in one sum at the commencement of the course, or 130 guineas if paid by instalments, as follows: First year 60 guineas, second year 50 guineas, third year 20 guineas. Hospital practice and clinical instruction, perpetual, 36*l.* 15*s.*; one year, 15*l.* 15*s.*; six months, 10*l.* 10*s.* Practical pharmacy, three months, 5*l.* 5*s.*

WESTMINSTER HOSPITAL.—*Appointments:* There are numerous dresserships and clerkships: the posts of medical and surgical registrar, each with 40*l.* a year, and of house physician, house surgeon, resident obstetric assistant, assistant house surgeon, physician's assistant, surgeon's assistant, ophthalmic assistant, and assistant in the skin department.

Scholarships, &c.—Entrance scholarships, in October. The *Fence*, 40*l.* a year for two years, and one other, value 40*l.* Subjects—Latin, Mathematics, French or German, and Chemistry and Natural Philosophy. The Latin books the same as the June examination of the University of London matriculation—*Livy*, Bk. II. There are also—an exhibition, value 10*l.* 10*s.*, for first year's men; a scholarship in anatomy and physiology, value 21*l.*, for second year's men; prizes for clinical medicine and surgery of 5*l.* each; the Frederic Bird medal and prize, value 15*l.*; the Chadwick prize for proficiency, value 21*l.*

Scale of Fees.—In one payment, 92*l.* 10*s.*; in two payments of 49*l.* each, payable on entrance and at commencement of second year respectively, by payments distributed over five sessions, amounting to 107*l.* 2*s.* There are no extras, except parts for dissection. Fees for shorter periods or for single courses may be learned on application to the Dean. Fees for dental students, payable in one sum on entrance, 45*l.*

SPECIAL SCHOOLS.

LONDON SCHOOL OF MEDICINE FOR WOMEN.

The winter session of 1881-2 opens on the 1st of October. The fee for the ordinary curriculum of non-clinical lectures is £80, if paid in one sum, or if paid in instalments £40 for the first year,

£30 for the second, and £15 for the third. The courses of lectures included in this fee are as follows:—Two courses each of anatomy, practical anatomy, physiology, and practice of medicine, and one course each of botany, chemistry, practical chemistry, materia medica, surgery, pathology, midwifery, diseases of women and forensic medicine. Certain classes are held annually, others bi-annually. The fee of £90 entitles a student to attend, in addition to the classes enumerated above, one course each of practical physiology, zoology, ophthalmic surgery, mental pathology, and hygiene. The London School of Medicine for Women is now recognised by the King and Queen's College of Physicians, Ireland, and by the University of London. Students of the school can therefore proceed to the examination for the licence to practice medicine of the college, and for the degrees of M.D. and M.S. of the University. Hospital instruction is obtained at the Royal Free Hospital, some ten minutes' walk from the school; the fee for which, including annual courses of clinical medicine and clinical surgery, is £20 for the first year, and £15 for each subsequent year. Clinical clerks, surgical dressers, are selected from among the senior students without further fee.

SCHOOL OF ANATOMY AND PHYSIOLOGY.

This is established for private tuition, and is situate close to University College, its principal being Mr. Thomas Cooke, F.R.C.S., senior assistant-surgeon to the Westminster Hospital, whose private address is at 16 Woburn Place. The whole of the anatomy (on the dissected body), of physiology (with microscopical preparations, and such experiments as the law permits) and operative surgery (on the dead body), are gone through carefully every three months. Fees: Three months, three guineas; six months, four guineas; for the higher examinations, with special supplementary class, five guineas. There is a well-appointed dissecting-room near the school.

LONDON SCHOOL OF DENTAL SURGERY.

This institution is situated in Leicester Square. The meetings of the Odontological Society are also held here. In winter lectures are delivered on mechanical dentistry by Dr. Walker, on Wednesdays at five p.m.; on metallurgy in dentistry, by Mr. Louis, on Thursdays and Fridays at twelve o'clock, during October and November. In summer Mr. A. Coleman lectures on dental surgery and pathology, and Mr. C. S. Tomes on dental anatomy and physiology. General fee for special lectures required for the curriculum, £15 15*s.* The Saunders scholarship of £20 per annum, and prizes are open for competition. In connection with the above is the

DENTAL HOSPITAL OF LONDON.—Surgeons: Messrs. Fox, Melwin, Gregson, Coleman, Moon, and Hill. Assistant-Surgeons: Messrs. Hepburn, F. Canton, Underwood, Woodhouse, Hutchinson, and Bennett. Dental House Surgeon, Mr. Blackmore. Assistant Dental House Surgeon, Mr. Carle. Fees for two years' hospital practice, £15 15*s.* Fees for lectures and practice, £31 10*s.*

NATIONAL DENTAL COLLEGE.

This is a more modern institution than the one in Leicester Square, having been open but a few years. In connection with the College is the National Dental Hospital, situate in Great Portland Street, which was established several years before the school. The teaching at this school is recognised by the Royal College of Surgeons for the dental diploma, and lectures and demonstrations are given similar to those at the other dental school. The following are the lecturers, with their subjects:—Dental anatomy and physiology, Mr. Thomas Gaddes. Dental surgery and pathology, Mr. Oakley Coles. Dental mechanics, Mr. Harry Ross. Dental metallurgy, Mr. Alfred Tribe. Supplemental lectures:—Operative dental surgery, Dr. Thompson. Demonstration of dental mechanics, Mr. W. R. Humby. The session commences on October 3rd. Fees.—General fee for special lectures required by the curriculum, £12 12*s.*; fee for the two years' hospital practice required by the curriculum, £12 12*s.* Total fee for the special lectures and hospital practice required by the curriculum, £25 4*s.*

SCHOOL OF PHARMACY OF THE PHARMACEUTICAL SOCIETY OF GREAT BRITAIN.

Lectures are delivered on Monday, Tuesday, and Wednesday mornings at nine o'clock. The course consists of sixty lectures. Two courses are given annually, the first commencing in October, and the second course in March, 1882. The subjects of these lectures are—(1) Physics in relation to chemistry and pharmacy. (2) Inorganic chemistry. (3) Organic chemistry, botany, and materia medica. These lectures are delivered on Thursday, Friday, and Saturday mornings at nine o'clock. The laboratories are open from ten o'clock in the morning until five in the afternoon daily, except on Saturdays, when they are closed at two o'clock. Fee for ten months, according to hours of attendance, twelve to twenty-five guineas; for shorter terms in proportion. Each student is expected to attend every lecture of the course for which he has entered, or to state the cause of absence to the professor or to an assistant.

SOUTH LONDON SCHOOL OF PHARMACY.

This school, which has accommodation for 120 students, is situated at Kennington Cross, and decidedly the most popular institution for the study of practical pharmacy and chemistry in London. Instruction is also given in analytical chemistry for the purpose of qualifying gentlemen in search of appointments under the Public Health and Adulteration of Food Acts, by the principal, Dr. Muter. Lectures are delivered daily in the laboratory, and each student is required to practically illustrate that he grasps the subject taught as the lecturer proceeds. The percentage of pupils passing at the examination is exceptionally high from this school. The winter session commences a fortnight earlier than the medical schools.

SCHOOL OF HOMŒOPATHY.

Homœopathy has now a school for students, which is situated in Great Ormond Street, where lectures and instructions according to homœopathic principles are given by duly qualified members of the medical profession, and where students who believe in the *similia similibus curantur* theory can be taught according to their bent. The winter session at this school opens on October 1st.

NOTE.—Where fuller information is required by the reader than that contained in the foregoing notes, it will generally be found on reference to our advertising columns, where also will be found the names of the staffs, lecturers, &c.

HOURS OF THE INTRODUCTORY LECTURES

To be delivered at the different Metropolitan Schools.

St. Bartholomew's Hospital: None. Session commences Oct. 3rd.
 Charing Cross Hospital: None. Session commences Oct. 3rd.
 St. George's Hospital: Mr. J. Warrington Haward, Oct. 3rd, at 4 p.m.
 Guy's Hospital: None. Session commences Oct. 3rd.
 King's College Hospital: Sir John Lubbock, F.R.S., Oct. 3rd, at 4 p.m.
 London Hospital: None. Session commences Oct. 3rd.
 St. Mary's Hospital: Mr. George P. Field, 3.30 p.m.
 Middlesex Hospital: Dr. B. Douglas Powell, Oct. 4th, at 3 p.m.
 St. Thomas's Hospital: Dr. Bernays, Oct. 1st at 3 p.m.
 University College: Prof. G. V. Poore, F.R.S., Oct. 3rd, at 8 p.m.
 Westminster Hospital: Mr. Bond, Oct. 3rd, at 3 p.m.

THE PRINCIPAL METROPOLITAN HOSPITALS TO WHICH NO MEDICAL SCHOOL IS ATTACHED.

Open to Students from the Larger Hospitals.

CITY OF LONDON HOSPITAL FOR DISEASES OF THE CHEST, Victoria Park.—This is a large and important hospital at the East End, containing 164 beds. Consulting physicians: Drs. T. B. Peacock, J. Risd. n Bennett, E. Lloyd Birkett, J. Andrew. Consulting surgeon: Mr. Eriksen, F.R.S. Physicians: Drs. S. H. Ward, J. C. Thorowgood, Shepherd, Eustace Smith. Assistant physicians: J. B. Berkhart, S. W. Berkhart, Fothergill, Heron, West, V. D. Harris, and J. A. Ormerod.

HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST, Brompton.—This is the largest institution for the treatment of affections of the chest in the United Kingdom, and contains 192 beds. Consulting physicians: Drs. C. J. B. Williams, W. H. Walshe, and R. Quain. Consulting surgeon: Prof. John Marshall, F.R.S. Physicians: Drs. J. E. Pollock, E. S. Thompson, C. T. Williams, D. D. Powell, J. Tatham, and R. Thompson. Assistant physicians: Drs. T. H. Green, J. M. Bruce, W. Ewart, J. Fowler, P. Kidd, and C. Y. Biss. Dental surgeon: Mr. C. J. Noble. Resident medical officer: Mr. F. J. Hicks. Secretary: Mr. H. Dobbin. Three clinical assistants reside in the hospital for a period of six months. Pupils are admitted to the practice of the hospital. Terms, £3 3s. for three months; perpetual, £5 5s.

HOSPITAL FOR DISEASES OF THE THROAT AND CHEST, Golden Square, W.; contains 21 beds, outposts, Newington Butts, Walworth, and St. John's Gardens, Notting Hill.—Physicians: Drs. Morrell Mackenzie, Robert H. Semple, Prosser James, W. McNeill Whistler, and F. Semon. Surgeons: Dr. E. Woakes and Mr. W. R. H. Stewart. Dental surgeon: Mr. Oakley Coles. The practice of the hospital is open to students on payment; fee for three months' course, £3 3s.; for six months, £5 5s.; perpetual course, £7 7s. Laryngoscopic demonstrations are given daily at half-past two.

CENTRAL LONDON THROAT HOSPITAL, Gray's Inn Road.

—Twenty beds. The staff consists of Mr. Sydney Jones, consulting surgeon, and Messrs. Lennox Browne and Llewelyn Thomas, surgeons. Assistant surgeons: Messrs. G. R. Steil, F. G. Hamilton, and A. Orwin. Registrar and pathologist: Dr. J. Dundas Grant. Six clinical assistants, being either qualified practitioners or students of three years' standing, are elected to assist the surgeons. Fees for three months' attendance, £2 2s.; six months', £3 3s.

ROYAL HOSPITAL FOR DISEASES OF THE CHEST, City Road, E.C.—This hospital treats above 6,000 out-patients annually, and makes up 28 beds. A new wing, of which the foundation stone was laid two years since by Princess Louise, has now raised the number of beds to 40. Consulting physicians: Drs. Herbert Davies and Horace Dobeil. Physicians: Drs. G. Goddard Rogers, P. J. Hensley, Gilbert Smith, and D. W. Finlay. Assistant physicians: Drs. W. Murrell, H. S. Gabbett, and W. H. White. Consulting surgeon: Mr. Jonathan Hutchinson. Surgeon: Mr. W. Walsham. House physician: Mr. J. Harper.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, Queen's Square, W.C., and Cromwell House, Highgate.—Physicians: Drs. Dickenson, Gee, and W. B. Cheadle. Assistant physicians: Drs. R. J. Lee, C. Sturges, Thomas Barlow, D. B. Lees, and Robert Bridges. Surgeons: Mr. T. Smith, Mr. F. Howard Marsh, Mr. Edmund Owen, and Mr. J. H. Morgan. Ophthalmic surgeon: Mr. Nettleship. Surgeon-dentist: Mr. A. Cartwright. Fee for three months' attendance, £3 3s.; perpetual, £5 5s. Secretary: Mr. S. Whitford. There are now 104 beds in the hospital, Great Ormond Street, and 52 beds in the country branch; total, 156. The practice at the hospital has recently been thrown open gratuitously to the pupils of the different hospitals and medical schools of London, on conditions which may be ascertained of the secretary.

THE HOSPITAL FOR WOMEN, Soho Square, W.—Physicians: Drs. Protheroe Smith, Heywood Smith, C. H. Carter. Surgeon: Mr. H. A. Reeves. Assistant physicians: Drs. R. T. Smith, E. Holland, Mansell Moullin. Chloroformist: T. Bird. The hospital contains 61 beds. Clinical instruction is regularly given in the wards, and in the out-patient room daily at 10, to members of the profession and to students after their third year. Clinical clerks and assistants are appointed from time to time, application to be made to the physicians.

BRITISH LYING-IN HOSPITAL, Endell Street, St. Giles's.—Twenty five beds. Consulting physician: Dr. Priestley. Consulting surgeon: T. Spencer Walls. Physicians: Drs. Heywood Smith and S. Fancourt Barnes. This institution receives women only as midwifery pupils. The fee for the course of three months is £10 10s. Pupils who prove themselves competent receive a certificate signed by the physicians enabling them to practise midwifery.

THE SAMARITAN FREE HOSPITAL FOR WOMEN AND CHILDREN, Lower Seymour Street, W.—Fifty-two beds. Physicians: C. H. F. Routh, W. R. Rogers, W. H. Day, Wynn Williams, P. Boulton, F. H. Champneys, and Prickett. Surgeons: G. C. Bantock, J. K. Thornton, A. H. G. Doran, and W. A. Meredith.

ROYAL LONDON OPHTHALMIC HOSPITAL, Bloomfield Street, Moorfields, is the largest of its class in the metropolis, and contains 100 beds. Consulting physician: Dr. F. J. Farre. Consulting surgeons: Messrs. J. Dixon, G. Critchett, W. Bowman, F.R.S., and J. Hutchinson. Surgeons: Messrs. Wordsworth, Streetfield, Hulke, Lawson, Couper, and Lyell. Assistant surgeons: W. Tay, J. E. Adams, J. Tweedy. Number of patients annually, about 26,000.

LONDON FEVER HOSPITAL, Islington.—260 beds. Consulting physician: Dr. Tweedie. Physicians: Drs. Broadbent and Cayley. Assistant physician: Dr. Mahomed. Consulting surgeon: Mr. W. S. Savory. Resident medical officer: Mr. Tonge-Smith.

ST. PETER'S HOSPITAL FOR STONE AND URINARY DISEASES, 54 Berners Street, Oxford Street.—Surgeons: Walter J. Coulson, W. F. Teevan. Assistant surgeon: Dr. F. R. Heycock. Medical men and students are admitted to the practice of the hospital gratis. It contains 16 beds, and nearly 200 in-patients were treated during the past year.

GREAT NORTHERN HOSPITAL, Caledonian Road.—Physicians: Drs. Cholmeley, Cook, Bridges, and Burnet. Obstetric physician: Dr. Gustavus C. P. Murray. Consulting surgeon: Mr. F. Le Gros Clark, F.R.S. Surgeons: Messrs. Gay, W. Adams, W. Spencer Watson, W. H. Gripps, and

J. Macready. Ophthalmic surgeon: Mr. R. W. Lyell. Aural surgeon: Mr. A. E. Cumberbatch. Dental surgeon: Mr. C. J. Fox. Chloroformist: Mr. Eastes. House surgeon: Mr. A. Wharry.

WEST LONDON HOSPITAL.—A well-appointed hospital at the western extremity of the metropolis in the Hammer-smith Road, containing 60 beds. Consulting physician: Dr. Maudsley. Consulting physician-acoucheur: Dr. W. O. Priestley. Consulting surgeons: Messrs. S. A. Lane and William Bird. Physicians: Dr. Goddard, Rogers, and Thorowgood. Physician for diseases of women: Dr. Wiltshire. Surgeons: Messrs. W. F. Teevan and Alfred Cooper. Ophthalmic surgeon: Mr. B. J. Vernon. Assistant physicians: Drs. Fish and D. W. C. Hood. Assistant surgeons: Messrs. Keetley, Morgan, and Edwards. Surgeon-dentist: Mr. Smale. Gentlemen desirous of acting as clinical clerks or dressers can obtain all information by application to Mr. Gilbert, at the hospital.

BETHLEM HOSPITAL.—This hospital is open for the admission of two resident medical students who have recently obtained their diplomas to practise medicine and surgery, for the acquisition of knowledge regarding the insane. The next election takes place in October, at Bridewell Hospital, and the elected candidates will be expected to commence residence on the 1st of November.

ROYAL FREE HOSPITAL, Gray's Inn Road.—This hospital contains 150 beds. Of the smaller metropolitan hospitals few offer a more extensive field for students in medicine and surgery. An arrangement has been made by which medical students from the School of Medicine for Women are enabled to attend their hospital courses at this institution. Physicians: Drs. Hassall and Cockle. Surgeons: Messrs. F. J. Gant and W. Rose. Secretary: Mr. J. S. Blyth, from whom full particulars of the dresserships and clerkships may be obtained. Assistant surgeon: Mr. W. H. Cripps. House surgeon: Mr. R. Atkinson.

THE TEMPERANCE HOSPITAL.—The character of this institution is fully described by its title, and the non-alcoholic treatment is carried out in its entirety by an efficient staff. It is situated close to University College in Gower Street, and now boasts of a new and commodious building.

SEAMEN'S HOSPITAL (late *Dreadnought*) Greenwich.—300 beds. For the reception of seamen of all nations, who are received at all hours. Apartments are provided in the house of the surgeon for students and others who may be desirous of studying diseases incidental to tropical climates before entering the services or going abroad.

ENGLISH PROVINCIAL MEDICAL SCHOOLS.

BIRMINGHAM—QUEEN'S COLLEGE.—Students are admitted—(1) as matriculated students who enter for their entire medical education; (2) as occasional students for one or more courses of lectures; (3) as junior students, to prepare for the preliminary examinations of the licensing boards.

Scholarships, Prizes, &c.—The Sands Cox prize, value £20. Open to students who have completed their curriculum. Subjects:—Medicine, Surgery, and Midwifery. Two Ingleby scholarships for obstetric medicine and surgery and diseases of women. The Warden's prize, value £5 5s., for first year's students, for general proficiency. The Percy prize, value £5 5s., for German.

Fees.—College fee for all lectures amount to 60 guineas, payable by two equal instalments.

Hospital practice is obtained at the General and Queen's Hospitals, which have been amalgamated for the purpose of clinical instruction under the direction of the Birmingham Clinical Board by whose order all schedules are signed and all examinations conducted. The hospitals have a total of upwards of 400 beds, and the staff attached is of a very high order.

All students will be required to attend six months alternately at each hospital, as directed by the Clinical Board, excepting students who enter the hospital for six months only.

Clinical Prizes.—The following prizes are given annually: Senior medical prize for third and fourth year's students, first prize, £8 5s.; second prize, £3 8s. Senior surgical prize for third and fourth year's students, first prize, £5 5s.; second prize, £3 8s. Junior medical prize, for second year's students, first prize, £3 3s.; second prize, £2 2s. Junior surgical prize for second year's students, first prize, £3 8s.; second prize, £2 2s. Midwifery prize £4. Medals and certificates are awarded in each class. The examinations for all the appointments and prizes are conducted by the Clinical Board, and are open for competition to all students registered by the Clinical Board.

Fees for attendance for four years on the medical and surgical practice, and on the clinical lectures at both hospitals, £42.

BIRMINGHAM.—THE MASON COLLEGE.—The magnificent institution, founded, built, and endowed by the late Mr. Josiah Mason, and devoted to the spread of scientific information, is now open for the reception of students under a staff of eminent professors. Special facilities are offered at the college to intending medical students to complete the preliminary scientific work without which they cannot hope to succeed in obtaining any one of the higher University degrees. Classes have been formed in chemistry, physics, biology, physiology, and practical work in all these subjects is carried out in well appointed and commodious laboratories. The fee for each course of lectures are payable in advance, and arranged on a scale of the most moderate kind, varying from half a guinea to three guineas for the whole. Further particulars will be found in the advertisement pages of the present number.

BRISTOL SCHOOL OF MEDICINE (University College).—Attached to this school, where there is ample provision for education and practice, are two well-appointed hospitals. The Royal Infirmary containing 264 beds, and the General Hospital, with 154 beds. Competitive examinations are held amongst students of the first, second, and third years respectively, and prizes of money, instruments, and books are awarded annually. The certificates of this school are accepted by all the examining boards. Medical and surgical hospital practice and clinical lectures are attended at the Royal Infirmary or at the General Hospital, at which institutions additional prizes are annually offered for competition amongst the students. The existing medical school forms a department of the College of Science and Literature.

Scholarships, Prizes, &c.—Prizes and certificates of honour are given in the medical school to first, second, and third year's students, and also in practical anatomy. At the Royal Infirmary—Supple's medical prize, a gold medal and £7 7s.; Supple's surgical prize, as the medical; Clark prize (interest of £100) for third year's student; pathological prize, £3 3s. At the General Hospital; Martyn memorial scholarship, £20; Clarke scholarship (surgical), £15; Sander's scholarship (interest of £500), medicine and surgery; Lady Haberfield's prize (£1,000), for general proficiency.

Clinical lectures are given at both institutions three and four times a week.

Fees.—School fees for unlimited attendance on all courses of lectures except comparative anatomy, £60.

LEEDS SCHOOL OF MEDICINE.—Clinical lectures are given by the physicians and surgeons attached to the General Infirmary. Ophthalmic demonstrations and demonstrations of skin diseases are given in the Infirmary by the surgeons in each department, where also are obtainable six clinical clerkships and eight dresserships. Besides the infirmary there is a large dispensary and a fever hospital, both of which are open to students of the school. Students at this school have excellent opportunities of acquiring a thorough insight of psychological medicine, as the renowned West Riding Lunatic Asylum is in connection, and Dr. Major lectures on mental diseases. The systematic lectures are given at the school, and the clinical lectures at the asylum, which now accommodates 1,500 patients.

There is the Hardwicke scholarship in clinical medicine, value £10, the Thorp, in forensic medicine, value £10; three surgeons' clinical prizes, of £8, £5, and £3 respectively. Silver and bronze medals, books, and certificates of honour, are awarded for proficiency in particular subjects.

The composition fee for attendance upon all the required courses of school lectures is £50 8s., to be paid on entrance; or £26 5s. on entrance, and a second sum of £26 5s. twelve months afterwards.

At the General Infirmary the perpetual fee for medical practice and clinical lectures is £26 5s. The same amount is charged for the perpetual attendance on the surgical practice and clinical lectures. These fees are not included in the composition fees for lectures, and are payable separately.

LIVERPOOL ROYAL INFIRMARY SCHOOL OF MEDICINE.—The infirmary attached to this school, which contains 300 beds, with 40 special wards for the treatment of diseases of women, is, perhaps, second to none in England in its general appointments, and the facilities it offers to students for gaining practical knowledge.

A payment of 50 guineas on entrance, or in two equal instalments (one-half on entrance, and the remainder within twelve months), entitles the student to attendance on all the necessary lectures and demonstrations. The Royal Infirmary contains nearly 800 beds. There are special wards for the treatment of uterine and other diseases of women. During the year 1880, 2,600 patients were admitted into the infirmary; the number of out-patients was 5,300. The Lock Hospital adjoining the infirmary contains 60 beds; during the past year 658 males and females were admitted as in-patients.

Two house physicianships and three house surgeons, tenable for six months, and open to pupils of the school who have obtained a legal qualification; clinical clerks and dressers; post-mortem clerks.

Two Roger Lyon Jones scholarships, each of £21, for two years, one awarded as an entrance scholarship, and the other being open to students who have completed their second year; the Torr gold medal for anatomy and physiology; the Bligh gold medal for anatomy and physiology. School medals and certificates of honour are awarded for proficiency in certain groups of subjects.

The fee for a perpetual ticket for hospital practice is £33 12s., and may be paid in two equal instalments (one-half on entrance, and the remainder within twelve months).

MANCHESTER — VICTORIA UNIVERSITY, OWENS COLLEGE SCHOOL OF MEDICINE.—This school, as most of our readers are aware, has resulted from the amalgamation of the Manchester Royal Infirmary School of Medicine with the Owens College, and occupies in the provinces a somewhat similar position to that of University College and Hospital in London. It has a faculty of science as well as of medicine, with departments of law and arts. Since the amalgamation, a new medical school has been built on the most improved principles, at the western extremity of the College Estate. On the ground floor are two large lecture theatres, a library, and a museum. Over the lecture theatre is a dissecting-room, and over the library a physiological laboratory. The course of instruction afforded to students is thoroughly complete. Three of the most important chairs—those of anatomy, physiology, and chemistry—are held by professors who entirely devote their time to the work of instruction. Students wishing to engage in physiological or pathological researches will find opportunities for study in the complete and well-furnished physiological laboratory. Two valuable physiological scholarships are placed for competition in this branch as an incentive to original research.

Appointments.—Resident medical officer, £250 per annum; resident medical officer at Cheadle, £150; resident medical officer at Monsall, £200; resident surgical officer, £150; eight house surgeons, six months each; four house physicians, for six months each; a registrar; a pathological registrar, £100 each.

Scholarships, Prizes, &c.—Turner scholarship, £25, for third year's men; Platt physiological scholarship (two), £50 each, five years; one annually for physiology. Platt exhibitions (two), £15 each, for physiology. Dunville surgical prize, £20; examination takes place in April, 1882. Prizes of books, instruments, &c., varying from £5 6s. to £3 8s., for third, second, and first year's students. Entrance for scholarships: Dauntsey medical scholarships—Candidates not to be over 25 years of age, may be registered, but must not have studied at any medical school; value about £100, for one year; successful candidates must at once enter on full medical course in the Owens College. Examination commences on October 3rd, 1881. Subjects: General and comparative anatomy, physiological botany, chemistry, including practical work, either mathematics or Latin. Gilchrist scholarships: Three of £50, for three years. One is annually awarded to candidates standing highest at matriculation of London University in June (provided he be in the honours division); failing such, two of £25 to the two candidates standing highest in the first division; candidates must be between 16 and 20 years of age. There are also grammar school scholarships.

Fees.—Composition fee, £68, or two sums of £31 10s. each. Hospital practice: composition fee £42, or two instalments of £22 each. Further information may be obtained of Professor Gange, Dean of the School, or of the Registrar, Mr. J. Holme Nicholson, Owens College, Manchester.

NEWCASTLE-ON-TYNE COLLEGE OF MEDICINE.—This school is a department of the University of Durham, and contains ample provision for acquiring a sound education and practical experience at the bed-side. It is smaller than some of the provincial schools, but with some parents and students, this would be considered an advantage.

Hospital practice is obtained at the Newcastle Infirmary, which has 230 beds, and in which the required clinical lectures are delivered.

Fuller information of this college will be found under the heading, "University of Durham."

SHEFFIELD SCHOOL OF MEDICINE.—Students at this college obtain excellent instruction in medical and surgical practice at the General Infirmary, which contains 180 beds, and is provided with a museum, and pathological and post-mortem theatres. The fees for perpetual attendance are £15 15s. for medical, and £21 for surgical practice; for twelve months' medical and surgical practice, each £10 10s., and for six months, £8 6s. each. There is also the Sheffield Hospital and Dispensary, containing 104 beds, and is recognized by the College of Surgeons and the Hospital for Diseases of Women, to which students are admitted. The perpetual fee for attendance on all the lectures required by Royal College of Surgeons and the Apothecaries' Hall, £45. Prizes to the value of £30, and certificates of honour, are given annually. Some of the lecturers, and other local members of the profession, receive house pupils; such a mode of residence will be found far preferable to life in ordinary lodgings.

LIVERPOOL ROYAL SOUTHERN HOSPITAL.—This institution is one of the largest in the English provinces, and contains 200 beds. It has no school proper, although it contains accommo-

modation for resident pupils, and clinical lectures are delivered daily by members of the staff. These, together with the practice obtained here, which is of a very varied and valuable character, are recognised by all the examining boards.

Inclusive fees: Perpetual, 25 guineas; one year, 10 guineas; six months, 7 guineas; three months, 4 guineas. Students can enter to the medical or surgical practice separately, on payment of half the above fees.

TECHNICAL EDUCATION IN ENGLAND.

STUDENTS in the technical and scientific branches of education can now gratify their aspirations to the fullest extent, and at very moderate cost. Beside the scientific knowledge obtainable by study at the various Universities, the Royal Institution of Great Britain, &c., special Colleges have recently been started both in London and the provinces, for the purpose of stimulating scientific research, and affording instruction in those departments relating chiefly to the industries of the world, to engineering, mineralogy, geology, &c. In London chairs have been endowed by the city livery companies, and a magnificent structure is being pushed forward as a permanent College of Technical Education. Meanwhile, there are temporary buildings for carrying on these studies, and there is the normal School of Science at South Kensington, and the Royal School of Mines in Jermyn Street. Birmingham also now boasts a Science College for the before-mentioned branches, the Session at which opens on October 3rd. This Institution is called the Mason Science College, having been founded and endowed by the munificence of a citizen of Birmingham, Sir Josiah Mason. Besides these institutions, Leeds, Manchester, Bristol, Nottingham, and other centres are making headway with special schools or classes for technical and scientific education, so that the student of to-day may congratulate himself upon the fact that the pursuit of knowledge need not now be under the difficulties which were encountered in the past.

IRISH QUALIFICATIONS TO PRACTISE.

THE Medical Licensing Bodies of Ireland are five in number, and, as a rule, medical students gravitate into one or other of three classes. *a.* Those who enter Trinity College, and take a full graduation in Arts, in addition to their professional degrees. *b.* Those who take the Licenses of the College of Surgeons with that of the College of Physicians or of the Apothecaries' Hall. *c.* Those who formerly took the Degree of the Queen's University, but who, henceforth (that institution being extinct), will probably take their qualifications at the New Royal Irish University because the graduation in Arts is not necessary in that institution. A fourth minor class is constituted by those who pursue their studies in Ireland, but who, either to escape the extended course of study required in Ireland, or to save the consequent fees, or because they cannot pass the Irish examination, migrate to Edinburgh or Glasgow for their licenses. Almost all these emigrants come from the Queen's Colleges, and the greater number of them from Belfast, while the Dublin students qualify, almost without exception, in Dublin.

The Irish licensing bodies are as follows:—

THE UNIVERSITY OF DUBLIN.—It grants the degrees of M.B. and B.Ch. to students who have obtained their Arts degree, and the higher degrees of M.D. and M.Ch. to those who have held, for at least three years, the grade of M.B. and B.Ch. It does not grant degrees to ungraduate students; consequently, its licenses hold the highest rank as social and educational qualifications, and are sought for by those who look forward to occupying the best positions in the profession.

The expense of obtaining the degree of Bachelor in Medicine and Bachelor in Surgery in the University of Dublin is approximately as follows:—Lectures, £61 3s.; Hospitals, £44 2s.; Degree Fees, £26=£132 5s. Private Tuition, say £20; Total, £149 3s.

The expense of the degree of Bachelor in Arts, amounting altogether to £83 4s., should be added to the foregoing, making the total cost £212 7s.

The University also grants a midwifery degree (M.A.O.) to its own medical graduates, at an additional fee of £5.

The regulations for the University degrees will be found on this page.
